> Briefing on How To Use the Federal Register For information on a briefing in Chicago, IL, see announcement on the inside cover of this issue.

FEDERAL REGISTER Published daily, Monday through Friday, (not published on Saturdays, Sundays, or on official holidays), by the Office of the Federal Register, National Archives and Records Administration, Washington, DC 20408, under the Federal Register Act (49 Stat. 500, as amended; 44 U.S.C. Ch. 15) and the regulations of the Administrative Committee of the Federal Register (1 CFR Ch. I). Distribution is made only by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402.

The Federal Register provides a uniform system for making available to the public regulations and legal notices issued by Federal agencies. These include Presidential proclamations and Executive Orders and Federal agency documents having general applicability and legal effect, documents required to be published by act of Congress and other Federal agency documents of public interest. Documents are on file for public inspection in the Office of the Federal Register the day before they are published, unless earlier filing is requested by the issuing agency.

The seal of the National Archives and Records Administration authenticates this issue of the Federal Register as the official serial publication established under the Federal Register Act. 44 U.S.C. 1507 provides that the contents of the Federal Register shall be judicially noticed.

The Federal Register will be furnished by mail to subscribers for \$340 per year in paper form; \$195 per year in microfiche form; or \$37,500 per year for the magnetic tape. Six-month subscriptions are also available at one-half the annual rate. The charge for individual copies in paper or microfiche form is \$1.50 for each issue, or \$1.50 for each group of pages as actually bound, or \$175.00 per magnetic tape. Remit check or money order, made payable to the Superintendent of Documents. Mail to: New Orders, Superintendent of Documents, P.O. Box 371954, Pittsburgh, PA 15250-7954, or charge to your GPO Deposit Account or VISA or Mastercard.

There are no restrictions on the republication of material appearing in the Federal Register.

How To Cite This Publication: Use the volume number and the page number. Example: 57 FR 12345.

THE FEDERAL REGISTER WHAT IT IS AND HOW TO USE IT

FOR: Any person who uses the Federal Register and Code of Federal Regulations.

WHO: The Office of the Federal Register.

WHAT: Free public briefings (approximately 3 hours) to present:

- The regulatory process, with a focus on the Federal Register system and the public's role in the development of regulations.
- The relationship between the Federal Register and Code of Federal Regulations.
- The important elements of typical Federal Register documents.
- An introduction to the finding aids of the FR/CFR system.

WHY: To provide the public with access to information necessary to research Federal agency regulations which directly affect them. There will be no discussion of specific agency regulations.

Presidential Documents

Title 3-

The President

Proclamation 6444 of June 10, 1992

Flag Day and National Flag Week, 1992

By the President of the United States of America

A Proclamation

"I have seen the glories of art and architecture," said Senator George Frisbie Hoar over a century ago, ". . . and the full moon rise over Mont Blanc; but the fairest vision on which these eyes ever looked was the flag of my country in a foreign land." As the great emblem of the United States, the Stars and Stripes has symbolized freedom and security to millions of people around the world. To the U.S. citizen abroad, Old Glory has offered comfort and reassurance, calling to mind the love of liberty that unites all Americans, wherever we may be. To the service member standing watch at some distant, lonely post, the flag has recalled the pride and support of our Nation—as well as the example of earlier patriots who likewise labored and sacrificed in the defense of liberty. While the flag has inspired deeper feelings of patriotism and duty among generations of Americans, it has also moved the hearts of countless other peoples, who have seen in its bright hues and gentle folds the shining promise of freedom—and the character of a Nation whose might and strength have been devoted to the service of justice and humanity.

Generations of American children have learned to show respect for the flag by reciting the Pledge of Allegiance, which is 100 years old this year. As we celebrate the centennial of this simple yet stirring promise, we know that it is much, much more than a mnemonic verse for school boys and girls. Rather, it is—as its author, Francis Bellamy, had hoped it would be—an ageless creed that embodies "the fundamental idea of patriotic citizenship, comprehending in broadest lines the spirit of our history and the deepest aim of our National life." When we recite the Pledge and promise our allegiance to this "one Nation, under God, indivisible, with liberty and justice for all," we reaffirm both the unity of our people and what President Eisenhower aptly described as "the transcendence of religious faith in America's heritage and future." As the Pledge of Allegiance states so eloquently, we Americans believe in Almighty God, the Source of all life and liberty; we believe in the inherent and unalienable rights and dignity of each human being; and we believe in equal opportunity, as well as equal protection of the law, for every citizen. Those are the convictions embodied by our flag, and those are the convictions that must ever be our guide, our hope, and our example to the world.

To commemorate the adoption of our flag, the Congress, by a joint resolution approved August 3, 1949 (63 Stat. 492), designated June 14 of each year as Flag Day. The Congress also requested the President, by joint resolution approved June 9, 1966 (80 Stat. 194), to issue annually a proclamation designating the week in which June 14 occurs as National Flag Week.

NOW, THEREFORE, I, GEORGE BUSH, President of the United States of America, do hereby proclaim June 14, 1992, as Flag Day and the week beginning June 14, 1992, as National Flag Week. I direct the appropriate officials of the government to display the flag of the United States on all government buildings during that week. I urge all Americans to observe Flag Day, June 14, and Flag Week by flying the Stars and Stripes from their homes and other suitable places.

I also urge the American people to celebrate those days from Flag Day through Independence Day, also set aside by the Congress (89 Stat. 211) as a time to honor America, by having public gatherings and activities at which they can honor our country in an appropriate manner, including publicly reciting the Pledge of Allegiance. On June 14, communities across the United States will join in a special "Pause for the Pledge of Allegiance" program in honor of the 100th anniversary of this tribute to our flag.

IN WITNESS WHEREOF, I have hereunto set my hand this tenth day of June, in the year of our Lord nineteen hundred and ninety-two, and of the Independence of the United States of America the two hundred and sixteenth.

Rules and Regulations

Federal Register

Vol. 57, No. 114

Friday, June 12, 1992

This section of the FEDERAL REGISTER contains regulatory documents having general applicability and legal effect, most of which are keyed to and codified in the Code of Federal Regulations, which is published under 50 titles pursuant to 44 U.S.C. 1510.

The Code of Federal Regulations is sold by the Superintendent of Documents. Prices of new books are listed in the first FEDERAL REGISTER issue of each

week.

RESOLUTION TRUST CORPORATION

12 CFR Part 1609

Interim Statement of Policy on Lower Income Occupancy Requirements for Bulk Sales in the Multifamily Affordable Housing Disposition Program

AGENCY: Resolution Trust Corporation.
ACTION: Interim statement of policy.

SUMMARY: The Resolution Trust
Corporation (Corporation) has adopted
an interim policy statement concerning
properties marketed under the
Affordable Housing Disposition
Program. Under this interim policy
statement, when more than one
multifamily property is purchased from
the Corporation as part of the same
negotiation, the Corporation will require
that not less than 15 percent of the
dwelling units in each separate property
purchased be made available to low- or
very-low income individuals.

On May 6, 1992 (57 FR 19500) the Corporation published an Interim Final Rule (12 CFR part 1609) concerning the Affordable Housing Disposition Program and has requested public comments.

DATES: This interim policy statement affects multifamily property marketed under the Affordable Housing Disposition Program for which the Corporation: (1) Issues a Notice of Marketing Period pursuant to 12 CFR 1609.7(b) on or after June 2, 1992, or (2) issues a Notice of Marketing Period pursuant to RTC Circular 10150.11 on or after June 2, 1992.

Comments must be received by July

ADDRESSES: Written comments regarding this interim policy statement should be addressed to John M. Buckley, Jr., Secretary, Resolution Trust Corporation, 801 17th Street, NW., Washington, DC 20434-0001. Comments

may be hand delivered to room 321 on business days between 9 a.m. and 5 p.m. Comments may also be inspected in the Public Reading Room, 801 17th Street, NW., between 9 a.m. and 5 p.m. on business days. Phone number (202) 416– 6940; FAX (202) 416–4753.

FOR FURTHER INFORMATION CONTACT: Stephen S. Allen, Director, Affordable Housing Disposition Program, (202) 416– 7348, or Barry R. Wides, Financing Coordinator, Affordable Housing Disposition Program, (202) 416–7138. (These are not toll-free numbers.)

SUPPLEMENTARY INFORMATION:

1. Purpose

To establish a policy concerning the application of RTC's lower-income occupancy requirements for multifamily properties sold in bulk under the Affordable Housing Disposition Program as part of the same negotiation.

2. Scope and Applicability

This policy addresses application of certain procedures established in accordance with the affordable housing provisions of section 21A(c) of the Federal Home Loan Bank Act, as amended by section 501 of the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 (FIRREA) (12 U.S.C. 1441a).

3. Background

Under the Affordable Housing Disposition (AHD) Program, as described in 12 CFR 1609, published in the Federal Register on May 6, 1992 (57 FR 19500), not less than 35 percent of all dwelling units purchased by a qualifying multifamily purchaser in a single transaction shall be made available for occupancy by and be maintained affordable for, lower-income families during the remaining useful life of the property in which the units are located, provided not less than 20 percent of all units shall be made available for occupancy by, and be maintained affordable for, very low-income families during the remaining useful life of such property. If an eligible multifamily purchaser, buys more than one eligible multifamily property as part of the same negotiation, the purchaser may meet the lower-income occupancy requirements "in the aggregate." For example, if 1,000 units in 10 properties (each with 100 units) were sold as part of the same negotiation with a single purchaser, the

purchaser could place deed restrictions on as few as four of the buildings (350 units), leaving the remaining six buildings free of lower-income occupancy restrictions.

Administration of the "aggregation" provision in this manner has raised questions regarding the consistency of this approach with the statutory mandate that the RTC conduct operations in a manner which 'maximizes the preservation of the availability and affordability of residential real property for low- and moderate-income individuals." If only a portion of the properties which are marketed through the AHD Program are actually subject to deed restrictions, then fewer properties are made available at restricted rents to lowincome individuals. RTC believes that the goals of the AHD Program are better served by requiring that at least 15 percent of the units in each property marketed under the Program be made available to low- or very low-income individuals consistent with RTC's statutory mandate. Beyond this minimum, bulk purchasers are given maximum flexibility to meet the requirements "in the aggregate."

4. Policy and Guidelines

If a qualifying multifamily purchaser buys more than one Eligible Multifamily Property as part of the same negotiation, the lower-income occupancy requirements established in 12 CFR 1609.2(c)(1) (and the additional lowerincome occupancy restrictions committed to pursuant to 12 CFR 1609.7(b)(9)) shall apply in the aggregate to the properties so purchased, provided that not less than 15 percent of the dwelling units in each separate property purchased shall be made available for occupancy by and maintained affordable (at rent levels established in 12 CFR 1609.7(b)(4)) for either very lowincome or lower-income families for the remaining useful life of the property in which the units are located.

Dated at Washington, DC, this 8th day of June 1992.

Resolution Trust Corporation.

John M. Buckley, Jr.,

Secretary.

[FR Dec. 92-13809 Filed 6-11-92; 8:45 am]

BILLING CODE 6714-01-M

DEPARTMENT OF TRANSPORTATION

Federal Aviation Administration

14 CFR Part 39

[Docket No. 91-CE-95-AD; Amendment 39-8274; AD 92-13-04]

Airworthiness Directives; Piper Models PA-23-150 and PA-23-160 Airplanes

AGENCY: Federal Aviation Administration, DOT. ACTION: Final rule.

SUMMARY: This amendment supersedes Airworthiness Directive (AD) 90-23-18, which required new preflight fuel system drainage procedures and fuel system modifications on certain Piper PA-23 series airplanes until its effectiveness was suspended on December 13, 1990. The Federal Aviation Administration (FAA) has since determined that the preflight fuel system drainage procedures required by AD 90-23-18 on the Piper Models PA-23-150 and PA-23-160 airplanes are necessary if a new dual fuel drain has not been installed, but that the modifications should not be mandatory. The actions specified by this AD are intended to prevent rough engine operation or complete power interruption caused by water contamination in the fuel.

DATES: Effective August 21, 1992. The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of August 21, 1992.

ADDRESSES: Service information that is applicable to this AD may be obtained from the Piper Aircraft Corporation, Customer Services, 2926 Piper Drive, Vero Beach, Florida 32960. This information may also be examined at the FAA, Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106.

FOR FURTHER INFORMATION CONTACT: Ms. Juanita Craft-Lloyd, Aerospace Engineer, Propulsion Branch, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349; Telephone (404) 991– 3810.

SUPPLEMENTARY INFORMATION: A proposal to amend Part 39 of the Federal Aviation Regulations to include an AD that is applicable to certain Piper Models PA-23-150 and PA-23-160 airplanes that have not been modified by the installation of a dual fuel drain kit, part number 765-363, was published in the Federal Register on January 27, 1992 (57 FR 3033). The action proposed

retaining the preflight fuel draining procedures that were required by suspended AD 90–23–18, but would not include the fuel system modifications requirement that was part of that AD. The proposed action would supersede AD 90–23–18.

Interested persons have been afforded an opportunity to participate in the making of this amendment. Due consideration has been given to the 18 comments received. Fourteen of the commenters support the proposed rule. These commenters agree that the use of standard inspection and maintenance procedures as specified in the proposed AD would eliminate water-in-the-fuel problems on certain Piper PA-23 series airplanes.

Two of the commenters propose the incorporation of airplane modifications to prevent or remove water in the fuel. These modifications are:

 The installation of an inclinometer on the side of the airplane and putting the airplane in a 2-degree nose-down attitude position when checking for water in the fuel after refueling; and

 The incorporation of a drain in the reservoir around the fuel cap to drain any water that collects in this area.

 The other two commenters are against the proposed rule and feel that an airplane design improvement is required to prevent water-in-the-fuel problems.

The FAA does not concur that a design improvement or the modifications referenced in the comments discussed above are necessary by this AD action in order to prevent water-in-the-fuel problems on certain Piper PA-23 series airplanes. Water can enter the fuel system on the affected airplanes through (1) condensation; (2) contaminated fuel; or (3) leaky fuel tank caps and door seals. The FAA has determined that (1) condensation is a small contributor to water-in-the-fuel problems and can be practically eliminated by promptly refilling all fuel tanks after each flight; (2) industry and federal controls on aviation fuels minimize the likelihood of contaminated fuel; and (3) the principal cause of water in the fuel for certain Piper PA-23 series airplanes is improperly sealed fuel filler caps and ineffective door seals. The problems with fuel filler caps and door seals are already addressed by AD 88-21-07 R1 for the affected airplanes.

Based on an extensive analysis of all available information including the comments discussed above, the FAA has determined that the use of standard inspection and maintenance procedures as specified by the provisions of the proposed AD are adequate to prevent

the water-in-the-fuel problems on certain Piper PA-23 series airplanes. The AD has not been changed as a result of the comments discussed above. The FAA has added a note that recommends precautions that could be taken in the event water exceeding one tablespoon is found in the fuel during the preflight draining procedures that are specified in Piper Service Bulletin No. 827A, dated November 4, 1988. Additional fuel drainings are recommended after the wings are rocked, or the airplane has been put in a nose-down attitude. If water continues to be found, then drainage and inspection of the tanks is recommended.

No comments were received on the FAA's determination of the cost to the public. After careful review, the FAA has determined that air safety and the public interest require the adoption of the rule as proposed except for the addition of the note discussed above and minor editorial corrections. The FAA has determined that the addition of the note and the minor corrections will not change the meaning of the AD nor add any additional burden upon the public than was already proposed.

It is not feasible for the FAA to determine how many Piper Models PA-23-150 and PA-23-160 airplanes have been modified by the installation of a dual fuel drain kit, part number 765-363. The following cost information is based on none of the fleet having these kits installed. The FAA estimates that 1,107 airplanes in the U.S. registry will be affected by the required AD, that it will take approximately .5 workhours (at the most) per airplane to incorporate the preflight draining procedures into the Owner Handbook and Pilots Operating Manual, and that the average labor rate is approximately \$55 an hour. Based on these figures, the total cost impact of this AD on U.S. operators is estimated to be \$30,442.50.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) will not have a significant economic impact,

positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the final evaluation prepared for this action is contained in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption "ADDRESSES".

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for Part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by removing AD 90-23-18, Amendment 39-6782 (55 FR 46787, November 7, 1990), and adding the following new AD:

92-13-04 Piper Aircraft Corporation:

Amendment 39–8274; Docket No. 91–CE– 95–AD. Supersedes AD 90–23–18, Amendment 39–6782.

Applicability: Models PA-23-150 and PA-23-160 airplanes (serial numbers 23-1 through 23-2046) that have not been modified by the installation of a dual fuel drain kit, part number 765-363, in accordance with the instructions in Part II of Piper Service Bulletin No. 827A, dated November 8, 1988, certificated in any category.

certificated in any category.

Compliance: Required within the next 180 calendar days after the effective date of this AD, unless already accomplished.

To prevent rough engine operation or complete power interruption caused by water contamination in the fuel, accomplish the following:

(a) Incorporate paragraphs 1 through 5 of the Aircraft Systems Operating Instructions that are contained in Part I of Piper Service Bulletin (SB) No. 827A, dated November 4, 1988, into the Owner Handbook and Pilots Operating Manual.

Note 1: Paragraphs 6 and 7 of the Handling and Servicing instructions that are contained in Part I of Piper SB No. 827A, dated November 4, 1988, are covered by AD 88–21– 07 R1.

Note 2: If more than one tablespoon of water is found in the fuel during preflight draining procedures, then it is recommended that fuel draining procedures be repeated after the wings are rocked or the airplane has been put in a nose-down attitude. If water continues to be found, drainage and inspection of the fuel tanks is recommended.

(b) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(c) An alternative method of compliance or adjustment of the compliance time that provides an equivalent level of safety may be approved by the Manages, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, Suite 210C, Atlanta, Georgia 30349. The request should be forwarded through an appropriate FAA Maintenance Inspector, who may add comments and then send it to the Manager, Atlanta Aircraft Certification Office.

Note 3: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Atlanta Aircraft Certification Office.

(d) The procedures required by this AD shall be done in accordance with Piper Service Bulletin No. 827A, dated November 4, 1988. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Piper Aircraft Corporation, Customer Services, 2928 Piper Drive, Vero Beach, Florida 32960. Copies may be inspected at the FAA. Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri, or at the Office of the Federal Register, 1100 L Street, NW.; room 8401, Washington, DC.

(e) This amendment (39-8274) supersedes AD 90-23-18, Amendment 39-6782.

(f) This amendment (39-8274) becomes effective on August 21, 1992.

Issued in Kansas City, Missouri, on June 3, 1992.

Gerald W. Pierce,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

[FR Doc. 92-13829 Filed 6-11-92; 8:45 am] BILLING CODE 4910-13-M

14 CFR Part 39

[Docket No. 91-CE-89-AD; Amendment 39-8276; AD 92-13-06]

Airworthiness Directives; Piper Models PA-46-310P and PA-46-350P Airplanes

AGENCY: Federal Aviation Administration, DOT. ACTION: Final rule.

SUMMARY: This amendment adopts a new airworthiness directive (AD) that is applicable to Piper Aircraft Corporation (Piper) Models PA-46-310P (Malibu) and PA-46-350P (Mirage) airplanes. This action requires inspection of the elevator trim cable guide tube to determine if it has been severed, and, if severed, installation of an elevator trim cable guide sleeve. Investigation of the trim system on one of the affected airplanes revealed a lockup of the trim

tab system because the elevator trim cable guide tube was severed and the mismatched halves had jammed the trim cable turnbuckles. The actions specified by this AD are intended to prevent sudden pitch changes related to a jammed trim tab, which could result in loss of control of the airplane.

DATES: Effective August 21, 1992. The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of August 21, 1992.

ADDRESSES: Service information that is applicable to this AD may be obtained from the Piper Aircraft Corporation, Customer Services, 2926 Piper Drive, Vero Beach, Florida 32960. This information may also be examined at the Federal Aviation Administration (FAA), Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106; or at the Office of the Federal Register, 1100 L Street NW., room 8401, Washington, DC.

FOR FURTHER INFORMATION CONTACT: Mr. Robert L. Miller, Aerospace Engineer, FAA, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349; Telephone (404) 991–3020; Facsimile (404) 991–3606.

SUPPLEMENTARY INFORMATION: A proposal to amend Part 39 of the Federal Aviation Regulations to include an AD that is applicable to certain Piper Models PA-46-310P and PA-46-350P airplanes was published in the Federal Register on March 2, 1992 (57 FR 7328). The action proposed an inspection to determine if the elevator trim cable guide tube has been severed, and, if severed, installation of an elevator trim cable guide sleeve in accordance with the instructions in Elevator Trim Cable Guide Tube Splice Kit, Piper Part Number 766-272. This kit is referenced in Piper Service Bulletin No. 953, dated October 29, 1991.

Interested persons have been afforded an opportunity to participate in the making of this amendment. No comments were received on the proposed rule or the FAA's determination of the cost to the public. After careful review, the FAA has determined that air safety and the public interest require the adoption of the rule as proposed except for minor editorial corrections. The FAA has determined that these minor corrections will not change the meaning of the AD nor add any additional burden upon the public than was already proposed.

The FAA estimates that 403 airplanes in the U.S. registry will be affected by

this AD, that it will take approximately 1.5 hours per airplane to accomplish the required action, and that the average labor rate is approximately \$55 an hour. Parts cost approximately \$25 per airplane. Based on these figures, the total cost impact of the AD on U.S. operators is estimated to be \$43,322.50.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12812, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) will not have a significant economic impact. positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the final evaluation prepared for this action is contained in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption "ADDRESSES".

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

 The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

Section 39.13 is amended by adding the following new AD:

92-13-96 Piper Aircraft Corporation: Amendment 39-8276; Decket No. 91-CE-

Applicability: The following model airplanes, certificated in any category:

Models	Serial Nos.
PA-46- 310P. PA-46- 350P.	46-8406001 through 46-8606067 and 4608001 through 4608440. 4622001 through 4622117.

Compliance: Required within the next 100 hours time-in-service after the effective date of this AD, unless already accomplished.

To prevent sudden pitch change related to a jammed trim tab, which could result in less of control of the airplane, accomplish the following:

(a) Visually inspect the elevator trim cable guide tube for severance. Severance is defined as any cut, break, or division of the elevator trim cable guide tube (generally performed to gain access to the trim cable turnbuckles).

(b) If severance is found, prior to further flight, splice the elevator trim cable guide tube and install an external sleeve in accordance with the instructions in Elevator Trim Cable Guide Tube Splice Kit, Piper Part Number 766–272.

Note 1: Revised maintenance procedures on gaining access to the trim cable turnbuckles may be obtained from the manufacturer at the address specified in paragraph (e) of this AD.

(c) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(d) An alternative method of compliance or adjustment of the compliance time that provides an equivalent level of safety may be approved by the Manager. Atlanta Aircraft Certification Office, 1869 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349. The request should be forwarded through an appropriate FAA Maintenance Inspector, who may add comments and then send it to the Manager. Atlanta Aircraft Certification Office.

Note 2: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Atlanta Aircraft Certification Office.

(e) The possible modification required by this AD shall be done in accordance with Elevator Trim Cable Guide Tube Splice Kit. Piper Part Number 766-272, which is referenced in Piper Service Bulletin No. 953, dated October 28, 1991. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Piper Aircraft Corporation, 2926 Piper Drive, Vero Beach, Florids 32960. Copies may be inspected at the FAA, Central Region, Office of the Assistant Chief Counsel, room 1558, 801 E. 12th Street, Kansas City. Missouri, or at the Office of the Federal Register, 1100 L Street, NW., room 8401, Washington, DC.

(f) This amendment [39-8276] becomes effective on August 21, 1992.

Issued in Kansas City, Missouri, on June 3,

Gerald W. Pierce,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

[FR Doc. 92-13828 Filed 6-11-92; 8:45 am]

14 CFR Part 39

[Docket No. 91-CE-99-AD; Amendment 39-8275; AD 92-13-05]

Airworthiness Directives; Piper Aircraft Corporation Models PA-34-200 and PA-34-200T Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule.

summary: This amendment adopts a new airworthiness directive (AD) that is applicable to Piper Aircraft Corporation (Piper) Models PA-34-200 (Seneca) and PA-34-200T (Seneca II) airplanes. This action requires an inspection to ensure that a clevis-head bolt is installed correctly in the nose gear centering spring assembly, reinstallation if found incorrectly installed or replacement if a hex-head bolt is installed, and the incorporation of a placard that references the clevis-head bolt installation. Reports of nose gear extension problems prompted the Federal Aviation Administration (FAA) to investigate the nose landing gear system on several of the affected airplanes. The FAA found that the nose gear centering spring assembly was incorrectly installed in many instances. The actions specified by this AD are intended to prevent loss of control of the airplane during landing operations because of the inability to fully extend the nose landing gear.

DATES: Effective August 21, 1992.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of August 21,

ADDRESSES: Service information that is applicable to this AD may be obtained from the Piper Aircraft Corporation.
Customer Services, 2926 Piper Drive, Vero Beach, Florida 32980. This information may also be examined at the FAA, Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106.

FOR FURTHER INFORMATION CONTACT: Mr. Charles Perry, Aerospace Engineer, FAA, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349; Telephone (404) 991-2910; Facsimile (404) 991-3606.

SUPPLEMENTARY INFORMATION: A proposal to amend part 39 of the Federal Aviation Regulations to include an AD that is applicable to certain Piper Aircraft Corporation (Piper) Models PA-34-200 (Seneca) and PA-34-200T (Seneca II) airplanes was published in the Federal Register on February 3, 1992 (57 FR 3966).

This action proposed (1) an inspection to ensure that a clevis-head bolt is installed correctly in the nose gear centering spring assembly; (2) reinstallation if found incorrectly installed or replacement if a hex-head bolt is installed; and (3) incorporation of placard No. 582-943, which references the clevis-head bolt installation. The proposed actions would be done in accordance with Piper Service Bulletin No. 893, dated October 11, 1988.

Interested persons have been afforded an opportunity to participate in the making of this amendment. No comments were received on the proposed rule or the FAA's determination of the cost to the public. After careful review, the FAA has determined that air safety and the public interest require the adoption of the rule as proposed except for minor editorial corrections. The FAA has determined that these minor corrections will not change the meaning of the AD nor add any additional burden upon the public than was already proposed.

The FAA estimates that 2.048 airplanes in the U.S. registry will be affected by this AD, that it will take approximately 1 workhour per airplane to accomplish the required action, and that the average labor rate is approximately \$55 an hour. Parts cost approximately \$5 per airplane. Based on these figures, the total cost impact of the AD on U.S. operators is estimated to be

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures (44 FR 11034, February 26, 1979); and (3) will not have a significant economic impact,

positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the final evaluation prepared for this action is contained in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption ADDRESSES.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

1. The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423; 49 U.S.C. 106(g); and 14 CFR 11.89.

§ 39.13 [Amended]

2. Section 39.13 is amended by adding the following new AD:

92-13-05 Piper Aircraft Corporation: Amendment 39-8275; Docket No. 91-CE-99-AD.

Applicability: Model PA-34-200 airplanes (serial numbers 34-7250001 through 34-7450220) and Model PA-34-200T airplanes (serial numbers 34-7570001 through 34-8170082), certificated in any category.

Compliance: Required within the next 100 hours time-in-service after the effective date of this AD, unless already accomplished.

To prevent loss of control of the airplane during landing operations because of the inability to fully extend the nose landing gear, accomplish the following:

(a) Inspect the nose gear centering spring assembly and determine whether a clevishead bolt or hex-head bolt is installed.

(b) If a part number (P/N) 400-910 clevishead bolt is installed, ensure that it is correctly installed in accordance with paragraph 2 of the Instructions section of and Sketch "A" in Piper Service Bulletin (SB) No. 893, dated October 11, 1988.

(1) If the bolt is correctly installed, incorporate placard P/N 582-943 in accordance with paragraph 6(C) of the Instructions section of Piper SB No. 893.

dated October 11, 1988.

(2) If the bolt is incorrectly installed, disassemble and reinstall in accordance with paragraphs 3 through 6 of the Instructions section of Piper SB No. 893, dated October 11, 1988, and incorporate placard P/N 582-943 in accordance with paragraph 6(C) of the Instructions section of Piper SB No. 893. dated October 11, 1988.

(c) If a hex-head bolt or a clevis-head bolt that is not P/N 400-910 is installed, replace with a P/N 400-910 clevis-head bolt in

accordance with paragraphs 3 through 6 of the Instructions section of Piper SB No. 893, dated October 11, 1988, and incorporate placard P/N 582-943 in accordance with paragraph 6(C) of the Instructions section of Piper SB No. 893, dated October 11, 1988.

(d) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be

accomplished.

(e) An alternative method of compliance or adjustment of the compliance time that provides an equivalent level of safety may be approved by the Manager, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway. Suite 210C, Atlanta, Georgia 30349. The request shall be forwarded through an appropriate FAA Maintenance Inspector. who may add comments and then send it to the Manager, Atlanta Aircraft Certification

Note: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Atlanta Aircraft Certification Office.

(f) The inspection, installations, and replacements required by this AD shall be done in accordance with Piper Service Bulletin No. 893, dated October 11, 1988. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Piper Aircraft Corporation, 2926 Piper Drive. Vero Beach, Florida 32960. Copies may be inspected at the FAA, Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri, or at the Office of the Federal Register, 1100 L Street NW.; room 8401, Washington, DC.

(g) This amendment (39-8275) becomes effective on August 21, 1992.

Issued in Kansas City, Missouri, on June 3,

Gerald W. Pierce,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

[FR Doc. 92-13830 Filed 6-11-92; 8:45 am] BILLING CODE 4910-13-M

14 CFR Part 39

[Docket No. 91-CE-101-AD; Amendment 39-8277; AD 92-13-071

Airworthiness Directives; Piper Aircraft Corporation Models PA-46-310P and PA-46-350P Airplanes

AGENCY: Federal Aviation Administration, DOT.

ACTION: Final rule.

SUMMARY: This amendment adopts a new airworthiness directive (AD) that is applicable to certain Piper Aircraft Corporation (Piper) Models PA-46-310P (Malibu) and PA-46-350P (Mirage) airplanes. This action requires the replacement of certain empennage

countersunk rivets with universal head rivets of a larger diameter. General maintenance inspections of the empennage of the affected airplanes have revealed loose rivets working into the skin. Undetected loose rivets could eventually lead to a weakened airplane structure. The actions specified by this AD are intended to prevent structural deterioration because of loose empennage rivets.

DATES: Effective August 21, 1992.

The incorporation by reference of certain publications listed in the regulations is approved by the Director of the Federal Register as of August 21, 1992.

ADDRESSES: Service information that is applicable to this AD may be obtained from the Piper Aircraft Corporation, Customer Services, 2926 Piper Drive, Vero Beach, Florida 32960. This information may also be examined at the Federal Aviation Administration (FAA), Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City, Missouri 64106; or at the Office of the Federal Register, 1100 L Street NW., room 8401, Washington DC.

FOR FURTHER INFORMATION CONTACT: Mr. Charles Perry, Aerospace Engineer, FAA, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, suite 210C, Atlanta, Georgia 30349; Telephone (404) 991–2910; Facsimile [404] 991–3606.

SUPPLEMENTARY INFORMATION: A proposal to amend Part 39 of the Federal Aviation Regulations to include an AD that is applicable to certain Piper Models PA-46-310P and PA-46-350P airplanes was published in the Federal Register on March 2, 1992 (57 FR 7330). The action proposed the replacement of certain empennage countersunk rivets with universal head rivets of a larger diameter in accordance with Piper Service Bulletin No. 944, dated October 5, 1990.

Interested persons have been afforded an opportunity to participate in the making of this amendment. No comments were received on the proposed rule or the FAA's determination of the cost to the public. After careful review, the FAA has determined that air safety and the public interest require the adoption of the rule as proposed except for minor editorial corrections. The FAA has determined that these minor corrections will not change the meaning of the AD nor add any additional burden upon the public than was already proposed.

The FAA estimates that 512 airplanes in the U.S. registry will be affected by this AD, that it will take approximately 4 workhours per airplane to accomplish

the required action, and that the average labor rate is approximately \$55 an hour. Parts cost approximately \$5 per airplane. Based on these figures, the total cost impact of the AD on U.S. operators is estimated to be \$115,200.

The regulations adopted herein will not have substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. Therefore, in accordance with Executive Order 12612, it is determined that this final rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

For the reasons discussed above, I certify that this action (1) is not a "major rule" under Executive Order 12291; (2) is not a "significant rule" under DOT Regulatory Policies and Procedures [44 FR 11034, February 26, 1979); and [3] will not have a significant economic impact, positive or negative, on a substantial number of small entities under the criteria of the Regulatory Flexibility Act. A copy of the final evaluation prepared for this action is contained in the Rules Docket. A copy of it may be obtained by contacting the Rules Docket at the location provided under the caption ADDRESSES.

List of Subjects in 14 CFR Part 39

Air transportation, Aircraft, Aviation safety, Incorporation by reference, Safety.

Adoption of the Amendment

Accordingly, pursuant to the authority delegated to me by the Administrator, the Federal Aviation Administration amends 14 CFR part 39 of the Federal Aviation Regulations as follows:

PART 39—AIRWORTHINESS DIRECTIVES

The authority citation for part 39 continues to read as follows:

Authority: 49 U.S.C. 1354(a), 1421 and 1423: 49 U.S.C. 106(g): and 14 CFR 11.89.

§ 39.13 [Amended]

Section 39.13 is amended by adding the following new AD:

92-13-07 Piper Aircraft Corporation: Amendment 39-8277; Docket No. 91-CE-101-AD.

Applicability: Model PA 46-310P airplanes (serial numbers (S/N) 46-8408001 through 46-8608067 and S/N 4608001 through 4608140) and Model PA 46-350P airplanes (S/N 4622001 through 4622109), certificated in any category.

Compliance: Required within the next 100 hours time-in-service after the effective date of this AD, unless already accomplished.

To prevent structural deterioration because of loose empennage rivets, accomplish the following:

(a) Replace the empennage countersunk rivets indicated in Piper Service Bulletin (SB) No. 944, dated October 5, 1990, with universal head rivets of a larger diameter in accordance with the instructions section of Piper SB No. 944.

(b) Special flight permits may be issued in accordance with FAR 21.197 and 21.199 to operate the airplane to a location where the requirements of this AD can be accomplished.

(c) An alternative method of compliance or adjustment of the compliance time that provides an equivalent level of safety may be approved by the Manager, Atlanta Aircraft Certification Office, 1669 Phoenix Parkway, Suite 210C, Atlanta, Georgia 30349. The request shall be forwarded through an appropriate FAA Maintenance Inspector, who may add comments and then send it to the Manager, Atlanta Aircraft Certification Office.

Note: Information concerning the existence of approved alternative methods of compliance with this AD, if any, may be obtained from the Atlanta Aircraft Certification Office.

(d) The replacements required by this AD shall be done in accordance with Piper Service Bulletin No. 944, dated October 5, 1990. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies may be obtained from the Piper Aircraft Corporation. 2926 Piper Drive, Vero Beach, Florida 32960. Copies may be inspected at the FAA, Central Region, Office of the Assistant Chief Counsel, room 1558, 601 E. 12th Street, Kansas City. Missouri, or at the Office of the Federal Register, 1100 L Street, NW., room 8401, Washington, DC.

(e) This amendment (39-8277) becomes effective on August 21, 1992.

Issued in Kansas City, Missouri, on June 3, 1992.

Gerald W. Pierce,

Acting Manager, Small Airplane Directorate, Aircraft Certification Service.

[T.D. 92-56]

Customs Form for Collection Receipt or Informal Entry

AGENCY: U.S. Customs Service, Department of the Treasury.

ACTION: Final rule.

SUMMARY: This document sets forth amendments to the Customs Regulations to reflect adoption of Customs Forms 368 and 368A, Collection Receipt or Informal Entry. Customs Forms 368 and 368A are identical forms which combine and replace Customs Form 5104 (Cash Receipt) and Customs Form 5119-A (Informal Entry). The amendments involve substituting references to the new forms wherever references to the superseded forms appear in the regulations. In addition, one of the affected regulatory provisions is further amended by correcting an out-of-date reference to the informal entry value

EFFECTIVE DATE: June 12, 1992.

FOR FURTHER INFORMATION CONTACT: John Accetturo, Acting Chief, Revenue Branch, National Finance Center (317– 298–1308).

SUPPLEMENTARY INFORMATION:

Background

Until recently, Customs administered separate forms for purposes of issuing a receipt for funds paid to Customs (Customs Form 5104, Cash Receipt) and for purposes of informal entries (Customs Form 5119-A, Informal Entry). Customs Form 5104 consisted of a serially numbered, triplicate form and was used principally as a cash receipt and as a receipt for other payments made to Customs not involving payment of duties in connection with the filing of a formal entry/entry summary on Customs Form 7501 (for example, payment of vessel tonnage tax and light money and payment of processing fees for services provided by Customs to arriving vessels, commercial trucks and other conveyances). Customs Form 5119-A was a serially numbered form used in those cases in which merchandise is allowed to be entered under informal entry procedures (for example, most merchandise not exceeding \$1,250 in value and certain classes of merchandise entitled to free entry)

In July 1991 Customs instituted use of Customs Forms 368 and 368A, Collection Receipt or Informal Entry. These new forms are identical, serially numbered. triplicate forms which combine the essential elements of, and thus are intended to replace, Customs Forms 5104 and 5119-A. The new forms provide for insertion of information at the top to identify the payer/importer and the remainder of each form is principally divided into two separate parts identified as "Receipt" and "Informal Entry"; each form can be used either as a receipt document or as an informal entry document but an

individual form cannot be used for both purposes. The new forms differ from each other only in regard to the manner in which they are distributed and controlled by Customs: Customs Form 368 is distributed as a pad containing 50 triplicate forms attached thereto for use at busier Customs field locations. Customs Form 368A is distributed as a package containing 50 loose triplicate forms to be issued out singly at lower volume Customs field locations, and the recordkeeping procedures to be followed by Customs officers vary somewhat depending on the version being used.

Certain sections with parts 4, 19, 123. 141, 143, 145 and 148 of the Customs Regulations (19 CFR parts 4, 19, 123, 141, 143, 145 and 148) refer to superseded Customs Form 5104 or 5119-A. In order to reflect the adoption of Customs Forms 368 and 368A, this document replaces each such outdated reference with a reference to the new forms. (It should be noted that the amendments to sections 141.68(f) and 145.4(c), as set forth in this document, reflect earlier amendments to those sections effected by T.D. 91-73 which was published in the Federal Register on August 28, 1991 (56 F.R. 42526)). In addition, one of the affected provisions, section 123.4(b), is being further amended by replacing the reference to "\$250" with a reference to "\$1,250" in order to reflect the current limit for informal entries as provided in 19 U.S.C. 1498(a)(1); this provision was inadvertently omitted when the Customs Regulations were amended to reflect the statutory limit by T.D. 89-82 which was published in the Federal Register on August 31, 1989 (54 F.R. 36025).

Inapplicability of Notice and Delayed Effective Date Requirements

Inasmuch as these amendments constitute a rule of agency management and merely conform the Customs Regulations to, and thus clarify, existing administrative procedures and do not impose any additional substantive requirements on the general public, pursuant to 5 U.S.C. 553(b)(B), notice and public procedures are unnecessary and contrary to the public interest and, for the same reasons pursuant to 5 U.S.C. 553(d)(3), a delayed effective date is not required.

Executive Order 12291

Because these amendments constitute a rule of agency management, this rule is not subject to E.O. 12291 and, accordingly, a regulatory impact analysis is not required.

Regulatory Flexibility Act

Since this document is not subject to the notice and public procedure requirements of 5 U.S.C. 553, it is not subject to the provisions of the Regulatory Flexibility Act (5 U.S.C. 601 et seq.).

Drafting Information

The principal author of this document was Francis W. Foote, Regulations and Disclosure Law Branch, U.S. Customs Service. However, personnel from other offices participated in its development.

Imports.

Amendments to the Regulations

Accordingly, for the reasons stated above, parts 4, 19, 123, 141, 143, 145 and 148, Customs Regulations (19 CFR part 4, 19, 123, 141, 143, 145 and 148), are amended as set forth below.

PART 4—VESSELS IN FOREIGN AND DOMESTIC TRADES

 The general authority citation for part 4 continues to read as follows:

Authority: 5 U.S.C. 301; 19 U.S.C. 66, 1624; 46 U.S.C. App. 3;

§ 4.23 [Amended]

2. Section 4.23, first sentence, is amended by removing the words "(Customs Form 5104)" and adding, in their place, the words "(Customs Form 368 or 368A)".

PART 19—CUSTOMS WAREHOUSES, CONTAINER STATIONS AND CONTROL OF MERCHANDISE THEREIN

 The general authority citation for part 19 continues to read as follows:

Authority: 5 U.S.C. 301, 19 U.S.C. 66, 1202 (General Note 8, Harmonized Tariff Schedule of the United States), 1624.

§ 19.9 [Amended]

2. Section 19.9(c), second sentence, is amended by removing the words "Customs Form 3461, 7501, 5119-A," and adding, in their place, the words "Customs Form 3461, 7501, 368 or 368A,".

PART 123—CUSTOMS RELATIONS WITH CANADA AND MEXICO

 The authority citation for part 123 continues to read in part as follows:

Authority: 19 U.S.C. 66, 1202 (General Note 8, Harmonized Tariff Schedule of the United States), 1624.

Section 123.4 also issued under 19 U.S.C. 1484, 1498;

§ 123.4 [Amended]

2. Section 123.4(b), first sentence, is amended by removing the words "\$250 in value entered on Customs Form 5119—A," and adding, in their place, the words "\$1,250 in value entered on Customs Form 368 or 368A".

PART 141—ENTRY OF MERCHANDISE

 The authority citation for part 141 continues to read in part as follows:

Authority: 19 U.S.C. 66, 1448, 1484, 1624.

Section 141.68 also issued under 19 U.S.C. 1315;

§ 141.68 [Amended]

- 2. Section 141.68 is amended as follows:
- (a) Paragraph (f) is amended by removing the words "Customs Form 3419, 3419A or 5119-A" and adding, in their place, the words "Customs Form 3419 or 3419A or Customs Form 368 or 368A".
- (b) Paragraph (h) is amended by removing the words "Customs Form 5119A" wherever they appear and adding, in their place, the words "Customs Form 368 or 368A".

PART 143—SPECIAL ENTRY PROCEDURES

1. The authority citation for part 143 continues to read as follows:

Authority: 19 U.S.C. 66, 1481, 1484, 1498, 1624.

§ 143.23 [Amended]

2. Section 143.23, introductory text, is amended by removing the words "Customs Form 5119-A," and adding, in their place, the words "Customs Form 368 or 368A".

§ 143.24 [Amended]

3. The section heading to \$ 143.24 is revised to read "Preparation of Customs Form 7501 and Customs Form 368 or 368A (serially numbered)."

§ 143.24 [Amended]

4. Section 143.24, second sentence, is amended by removing the words "Customs Form 5119-A" and adding, in their place, the words "Customs Form 368 or 368A".

§ 143.25 [Amended]

5. Section 143.25 is amended by removing the words "Customs Form 5119-A" and adding, in their place, the words "Customs Form 368 or 368A".

PART 145—MAIL IMPORTATIONS

 The authority citation for part 145 continues to read in part as follows:

Authority: 19 U.S.C. 66, 1202 (General Note 8, Harmonized Tariff Schedule of the United States), 1624.

Section 145.4 also issued under 18 U.S.C. 545, 19 U.S.C. 1618;

Section 145.12 also issued under 19 U.S.C. 1315, 1484, 1498;

§ 145.4 [Amended]

2. Section 145.4(c), first sentence, is amended by removing the words "Customs Form 3419, 3419A or 5119—A (serially numbered) or 7501" and adding, in their place, the words "Customs Form 3419 or 3419A or Customs Form 368 or 368A (serially numbered) or Customs Form 7501".

§ 145.12 [Amended]

- 3. Section 145.12 is amended as follows:
- (a) Paragraph (b)(1), second sentence, is amended by removing the words "(Customs Form 5119-A), (serially numbered)" and adding, in their place, the words", Customs Form 368 or 368A (serially numbered),".
- (b) Paragraph (c), first sentence, is amended by removing the words "Customs Form 5119-A, (serially numbered)" and adding, in their place, the words "Customs Form 368 or 368A (serially numbered)".

(c) Paragraph (e)(1), second sentence, is amended by removing the words

"Customs Form 5119-A, (serially numbered)" and adding, in their place, the words "Customs Form 368 or 368A (serially numbered),".

PART 148—PERSONAL DECLARATIONS AND EXEMPTIONS

1. The general authority citation for part 148 continues to read as follows:

Authority: 19 U.S.C. 66, 1496, 1624. The provisions of this part, except for subpart C, are also issued under General Note 8, Harmonized Tariff Schedule of the United States, 19 U.S.C. 1202;

§ 148.12 [Amended]

2. Section 148.12(c) is amended by removing the words "Customs Form 5104" and adding, in their place, the words "Customs Form 368 or 368A".

§ 148.27 [Amended]

3. Section 148.27 is amended by removing the words "Customs Form 5104" and adding, in their place, the words "Customs Form 368 or 368A". Michael H. Lane,

Acting Commissioner of Customs.

Approved: May 26, 1992.

Peter K. Nunez,

Assistant Secretary of the Treasury (Enforcement).

INTERNATIONAL BOUNDARY AND WATER COMMISSION, UNITED STATES AND MEXICO, UNITED STATES SECTION

22 CFR Part 1101

ACTION: Final rule.

Privacy Act of 1974

AGENCY: United States Section, International Boundary and Water Commission, United States and Mexico.

SUMMARY: This document revises the United States Section, International Boundary and Water Commission (IBWC), regulations to implement the provisions of the Privacy Act of 1974 and to assure compliance with the Office of Management and Budget (OMB) Privacy Act Implementation Guidelines and Responsibilities.

EFFECTIVE DATE: June 12, 1992.

FOR FURTHER INFORMATION CONTACT: Mr. Reinaldo Martinez, U.S. Section Privacy Act Officer (915–534–6674).

SUPPLEMENTARY INFORMATION: On April 22, 1992, the United States Section, IBWC, published this agency's Privacy Act proposed rules in the Federal

Register (Vol. 55, pages 14674–14680). The comment period was from date of publication to May 22, 1992. No formal comments were received by this agency, therefore the rules remain as published in the April 22, 1992, Federal Register.

This document revises the regulations relating to the Privacy Act of 1974 (Pub. L. 93-579, as amended, 5 U.S.C. 552a) by changing or adding the following:

a. Address information is being updated.

b. Section 1101.3, paragraph (d) has been added. Previous rules did not mention that the request should state that it is being made under the Privacy Act

c. Section 1101.03, paragraph (i) has been changed. It now includes a statement to the effect that every effort will be made to provide the requested records within thirty [30] days.

d. Section 1101.6, paragraph (c) has been changed. Previous rules did not mention that a request to correct or amend a record should state that it is for a record that falls under the Privacy Act. Subparagraphs (1) thru (5) have been changed to clarify the five basic elements needed in a request for correcting or amending records that fall under the Privacy Act.

e. Section 1101.10, paragraph (a) has been changed. It has been rewritten to clarify that only copying fees may be charged under the Privacy Act and that no fees will be charged for search time or interpretation of the Act.

f. Section 1101.17, Annual report to Congress, has been added.

Sec.

1101.17 Annual Report to Congress.

Authority: Privacy Act of 1974 [Pub. L. 93-579, as amended, 5 U.S.C. 552a].

§ 1101.1 Purpose and scope.

The purpose of these regulations is to prescribe responsibilities, rules, guidelines, and policies and procedures to implement the Privacy Act of 1974 (Pub. L. 93-579, as amended; 5 U.S.C. 552a) to assure that personal information about individuals collected by the United States Section is limited to that which is legally authorized and necessary and is maintained in a manner which precludes unwarranted intrusions upon individual privacy. Further, these regulations establish procedures by which an individual can: (a) Determine if the United States Section maintains records or a system of records which includes a record pertaining to the individual and (b) gain access to a record pertaining to him or her for the purpose of review, amendment or correction.

§ 1101.2 Definitions.

For the purpose of these regulations: (a) Act means the Privacy Act of 1974.

(b) Agency is defined to include any executive department, military department, Government corporation. Government controlled corporation or other establishment in the executive branch of the Government (including the Executive Office of the President, or any independent regulatory agency) (5 U.S.C. 552)).

(c) Commission means the International Boundary and Water Commission, United States and Mexico.

(d) Commissioner means head of the United States Section, International Boundary and Water Commission, United States and Mexico.

(e) Individual means a citizen of the United States or an alien lawfully admitted for permanent residence.

(f) Maintain includes maintain, collect, use, or disseminate.

(g) Record means any item, collection, or grouping of information about an individual that is maintained by an agency, including, but not limited to, his education, financial transactions, medical history, and criminal or employment history and that contains his name, or the identifying number, symbol, or other identifying particular assigned to the individual, such as a finger or voice print or a photograph.

(h) Routine use means, with respect to the disclosure of a record, the use of such record for a purpose which is compatible with the purpose for which it is collected. (i) Section means the United States Section, International Boundary and Water Commission. United States and Maxico

(j) Statistical record means a record in a system of records maintained for statistical research or reporting purposes only and not used in whole or in part in making any determination about an identifiable individual, except as provided by 13 U.S.C. 8 (Census data).

(k) System of records means a group of any records under the control of any agency from which information is retrieved by the name of the individual or by some identifying number, symbol, or other identifying particular assigned to the individual.

§ 1101.3 General policy: Collection and use of personal information.

(a) Heads of Divisions, Branches, and the projects shall ensure that all Section personnel subject to their supervision are advised of the provisions of the Act. including the criminal penalties and civil liabilities provided therein, and that Section personnel are made aware of their responsibilities to protect the security of personal information, to assure its accuracy, relevance, timeliness and completeness, to avoid unauthorized disclosure either orally or in writing, and to ensure that no system of records concerning individuals, no matter how small or specialized, is maintained without public notice.

(b) Section personnel shall:

(1) Collect no information of a personal nature from individuals unless authorized to collect it to achieve a function or carry out a responsibility or function of the Section.

(2) Collect from individuals only that information which is necessary to Section responsibilities or functions;

(3) Collect information, wherever possible, directly from the individual to whom it relates:

(4) Inform individuals from whom information is collected of the authority for collection, the purpose thereof, the uses that will be made of the information, and the effects, both legal and practical, of not furnishing the information;

(5) Neither collect, maintain, use nor disseminate information concerning an individual's religious or political beliefs or activities or his membership in associations or organizations, unless (i) the individual has volunteered such information for his own benefit; (ii) the information is expressly authorized by statute to be collected, maintained, used or disseminated; or (iii) the activities involved are pertinent to and within the

scope of an authorized investigation or

adjudication activity;

(6) Advise an individual's supervisors of the existence or contemplated development of any system of records which retrieves information about individuals by individual identified;

(7) Maintain an accounting of all disclosures of information to other than

Section personnel;

(8) Disclose no information concerning individuals to other than Section personnel except when authorized by the Act or pursuant to a routine use published in the Federal Register;

(9) Maintain and process information concerning individuals with care in order to ensure that no inadvertent disclosure of the information is made to other than Section personnel; and

(10) Call to the attention of the PA
Officer any information in a system
maintained by the Section which is not
authorized to be maintained under the
provisions of the Act, including
information on First Amendment
activities, information that is inaccurate,
irrelevant or so incomplete as to risk
unfairness to the individual concerned.

(c) The system of records maintained by the Section shall be reviewed annually by the PA Officer to ensure compliance with the provisions of the

Act.

- (d) Information which may be used in making determinations about an individual's rights, benefits, and privileges shall, to the greatest extent practicable, be collected directly from that individual. In deciding whether collection of information from an individual, as opposed to a third party source, is practicable, the following criteria, among others, may be considered:
- (1) Whether the nature of the information sought is such that it can only be obtained from a third party;
- (2) Whether the cost of collecting the information from the individual is unreasonable when compared with the cost of collecting it from a third party;
- (3) Whether there is a risk that information requested from the third parties, if inaccurate, could result in an adverse determination to the individual concerned;
- (4) Whether the information, if supplied by the individual, would have to be verified by a third party; or

(5) Whether provisions can be made for verification by the individual of information collected from third parties.

(e) Employees whose duties require handling of records subject to the Act shall, at all times, take care to protect the integrity, security and confidentiality of these records. (f) No employee of the section may alter or destroy a record subject to the Act unless (1) such alteration or destruction is properly undertaken in the course of the employee's regular duties or (2) such alteration or destruction is required by a decision of the Commissioner or the decision of a court of competent jurisdiction.

§ 1101.4 Reports on new systems of records; computer matching programs.

(a) Before establishing any new systems of records, or making any significant change in a system of records, the Section shall provide adequate advance notice to:

(1) The Committee on Government Operations of the House of

Representatives:

(2) The Committee on Governmental Affairs of the Senate; and

(3) The Office of Management and

Budget.

(b) Before participating in any computerized information "matching program," as that term is defined by 5 U.S.C. 552a(a)(8) the Section will comply with the provisions of 5 U.S.C. 552a(o), and will provide adequate advance notice as described in § 1101.4(a) above.

§ 1101.5 Security, confidentiality and protection of records.

(a) The Act requires that records subject to the Act be maintained with appropriate administrative, technical and physical safeguards to ensure the security and confidentiality of records and to protect against any anticipated threats or hazards to their security or integrity which could result in substantial harm, embarrassment, inconvenience or unfairness to any individual on whom information is maintained.

(b) When maintained in manual form (typed, printed, handwritten, etc.) records shall be maintained, at a minimum, subject to the following safeguards, or safeguards affording

comparable protection:

(1) Areas in which the records are maintained or regularly used shall be posted with an appropriate warning stating that access to the records is limited to authorized persons. The warning shall also summarize the requirements of § 1101.3 and state that the Act contains a criminal penalty for the unauthorized dislosure of records to which it applies.

(2) During working hours: (i) The area in which the records are maintained or regularly used shall be occupied by authorized personnel or (ii) access to the records shall be restricted by their storage in locked metal file cabinets or a

locked room.

- (3) During non-working hours, access to the records shall be restricted by their storage in locked metal file cabinets or a locked room.
- (4) Where a locked room is the method of security provided for a system, that security shall be supplemented by: (i) Providing lockable file cabinets or containers for the records or (ii) changing the lock or locks for the room so that they may not be opened with a master key. For purposes of this paragraph, a master key is a key which may be used to open rooms other than the room containing records subject to the Act, unless those rooms are utilized by officials or employees authorized to have access to the records subject to the Act.
- (5) Personnel handling personal information during routine use will ensure that the information is properly controlled to prevent unintentional or unauthorized disclosure. Such information will be used, held, or stored only where facilities or conditions are adequate to prevent unauthorized or unintentional disclosure.
- (c) When the records subject to the Act are maintained in computerized form, safeguards shall be utilized based on those recommended in the National Bureau of Standard's booklet "Computer Security Guidelines for Implementing the Privacy Act of 1974" (May 30, 1975), and any supplements thereto, which are adequate and appropriate to assuring the integrity of the records.

§ 1101.6 Requests for access to records.

(a) Any individual may submit an inquiry to the Section to ascertain whether a system of records contains a record pertaining to him or her.

(b) The inquiry should be made either in person or by mail addressed to the PA Officer, United States Section, International Boundary and Water Commission, 4171 North Mesa, Suite C-310, El Paso, TX 79902-1422. The PA Officer shall provide assistance to the individual making the inquiry to assure the timely identification of the appropriate systems of records. The office of the PA Officer is located in Suite C-316 and is open to an individual between the hours of 8 a.m. and 4:30 p.m., Monday through Friday (excluding holidays).

(c) Inquiries submitted by mail should be marked "PRIVACY ACT REQUEST" on the bottom left-hand corner of the envelope.

(d) The letter should state that the request is being made under the Privacy

(e) Inquiries concerning whether a system of records contains a record

pertaining to an individual should contain the following:

(1) Name, address and telephone number (optional) of the individual

making the inquiry:

(2) Name, address and telephone number (optional) of the individual to whom the record pertains, if the inquiring individual is either the parent of a minor or the legal guardian of the individual to whom a record pertains:

(3) A certified or authenticated copy of documents establishing parentage or

guardianship;

(4) Whether the individual to whom the record pertains is a citizen of the United States or an alien lawfully admitted for permanent residence into the United States;

(5) Name of the system of records, as published in the Federal Register;

(6) Location of the system of records, as published in the Federal Register:

(7) Such additional information as the individual believes will or might assist the Section in responding to the inquiry and in verifying the individual's identity (for example: date of birth, place of birth, names of parents, place of work, dates of employment, position title, etc.);

(8) Date of inquiry; and (9) Signature of the requester.

The Section reserves the right to require compliance with the identification procedures appearing at paragraph (f) of this section where conditions warrant.

(f) The requirement for identification of individuals seeking access to records

are as follows:

(1) In person: Each individual making a request in person shall be required to present satisfactory proof of identity. The means of proof, in the order of preference and priority, are:

(i) A document bearing the individual's photograph (for example, driver's license, passport or military or

civilian identification card):

(ii) A document bearing the individual's signature, preferably issued for participation in a federally sponsored program (for example, Social Security card, unemployment insurance book, employer's identification card. national credit card and professional. craft or union membership card); and

(iii) A document bearing either the photograph or the signature of the individual, preferably issued for participation in a federally sponsored program (for example, Medicaid card). In the event the individual can provide no suitable documentation of identity. the Section will require a signed statement asserting the individual's identity and stipulating that the individual understands the penalty provision of 5 U.S.C. 552a(i)(3).

(2) Not in person: If the individual making a request does not appear in person before the PA Officer, a certificate of a notary public or equivalent officer empowered to administer oaths must accompany the

(3) Parents of minors and legal guardians: An individual acting as the parent of a minor or the legal guardian of the individual or an heir or legal representative of a deceased person to whom a record pertains shall establish his or her personal identity in the manner prescribed in either paragraph (f)(1) or (2) of this section. In addition, such individual shall establish his or her identity in the representative capacity of parent or legal guardian. In the case of the parent of a minor, the proof of identity shall be a certified or authenticated copy of the minor's birth certificate. In the case of a legal guardian of an individual who has been declared incompetent due to physical or mental incapacity or age by a court of competent jurisdiction, the proof of identity shall be a certified or authenticated copy of the court's order. A parent or legal guardian may act only for a living individual, not for a decedent. A parent or legal guardian may be accompanied during personal access to a record by another individual. provided the requirements of paragraph (f) of § 1101.7 are satisfied. In the case of an heir or legal representative of a deceased person the proof of identity shall be a certified copy of the Will, if any; the order of a court of competent jurisdiction admitting the Will to probate; the order of a court of competent jurisdiction appointing an executor, executrix, or administrator; a letter of administration; or any other documentary evidence which establishes the identity of the individual as an heir or legal representative of a deceased person.

(g) When the provisions of this part are alleged to have the effect of impeding an individual in exercising his or her right to access, the Section will consider, from an individual making a request, alternative suggestions regarding proof of identity and access to

(h) An inquiry which is not addressed as specified in paragraph (b) of this section or which is not marked as specified in paragraph (c) of this section will be so addressed and marked by the Section's personnel and forwarded immediately to the PA Officer. An inquiry which is not properly addressed by the individual will not be deemed to have been "received" for purposes of measuring time periods for response until forwarding of the inquiry to the PA

Officer has been effected. In each instance when an inquiry so forwarded is received, the PA Officer shall notify the individual that his or her inquiry was improperly addressed and the date when the inquiry was received at the proper address.

(i) Each inquiry received shall be acted upon promptly by the PA Officer. Although there is no fixed time when an agency must respond to a request for access to records under the Act, every effort will be made to respond within ten (10) days (excluding Saturdays, Sundays and holidays) of the date of receipt. If a response cannot be made within ten (10) days, the PA Officer shall send an acknowledgment during that period providing information on the status of the inquiry and asking for such further information as may be necessary to process the inquiry. Every effort will be made to provide the requested records within thirty (30) days.

(i) An individual shall not be required to state a reason or otherwise justify his or her inquiry.

§ 1101.7 Disclosure of records to individuals who are subjects of those records.

(a) Each request received shall be acted upon promptly by the PA Officer. Every effort will be made to respond within ten (10) days (excluding Saturdays, Sundays, and holidays) of the date of receipt. If a response cannot be made within ten (10) days due to unusual circumstances, the PA Officer shall send an acknowledgment during that period providing information on the status of the request and asking for such further information as may be necessary to process the request. Every effort will be made to provide the requested records within thirty (30) days. "Unusual circumstances" shall include circumstances where a search for and collection of requested records from inactive storage, field facilities or other establishments are required, cases where a voluminous amount of data is involved, instances where information on other individuals must be separated or expunged from the particular record. and cases where consultations with other agencies having a substantial interest in the determination of the request are necessary.

- (b) Grant of access:
- (1) Notification.
- (i) An individual shall be granted access to a record pertaining to him or her except where the record is subject to an exemption under the Act and these rules.

(ii) The PA Officer shall notify the individual of such determination and provide the following information:

(A) The methods of access, as set forth in paragraph (b)(2) of this section;

(B) The place at which the records

may be inspected;

(C) The earliest date on which the record may be inspected and the period of time that the records will remain available for inspection. In no event shall the earliest date be later than thirty (30) days from the date of notification;

(D) The estimated date by which a copy of the record could be mailed and the estimate of fees pursuant to § 1101.11. In no event shall be estimated date be later than thirty (30) days from

the date of notification;

(E) The fact that the individual, if he or she wishes, may be accompanied by another individual during the personal access, subject to the procedures set forth in paragraph (f) of this section; and

(F) Any additional requirements needed to grant access to a specific

record.

(2) Method of access: The following methods of access to records by an individual may be available depending on the circumstances of a given situation:

(i) Inspection in person may be made in the office specified by the PA Officer, between the hours of 8 a.m. and 4:30 p.m., Monday through Friday (excluding

holidays);

(ii) Transfer of records to a Federal facility more convenient to the individual may be arranged, but only if the PA Officer determines that a suitable facility is available, that the individual's access can be properly supervised at that facility, and that transmittal of the records to that facility will not unduly interfere with operations of the section or involve unreasonable costs, in terms of both money and manpower; and

(iii) Copies may be mailed at the request of the individual, subject to payment of the fees prescribed in § 1101.11. The Section, at its own initiative, may elect to provide a copy by mail, in which case no fee will be

charged to the individual.

(c) Access to medical records: Upon advice by a physician that release of medical information directly to the requester could have an adverse effect on the requester, the Section may attempt to arrange an acceptable alternative. This will normally involve release of such information to a physician named by the requester, with the requester's written consent. (Note that release to any third party, including a physician or family member, must

comply with the provisions of § 1101.8 of this part.)

(d) The Section shall supply such other information and assistance at the time of access to make the record intelligible to the individual.

- (e) The Section reserves the right to limit access to copies and abstracts of original records, rather than the original records. This election would be appropriate, for example, when the record is in an automated data media such as tape of disc, when the record contains information on other individuals, and when deletion of information is permissible under exemptions (for example 5, U.S.C. 552(k)(1)). In no event shall original records of the Section be made available to the individual except under the immediate supervision of the PA Officer or his designee. Title 18 U.S.C. 2701(a) makes it a crime to conceal, mutilate, obliterate, or destroy a record filed in a public office, or to attempt to do any of the foregoing
- (f) Any individual who request access to a record pertaining to that individual may be accompanied by another individual of his or her choice. "Accompanied" includes discussion of the record in the presence of the other individual. The individual to whom the record pertains shall authorize the presence of the other individual in writing and shall include the name of the other individual, a specific description of the record to which access is sought, and the date and the signature of the individual to whom the record pertains. The other individual shall sign the authorization in the presence of the PA Officer or his designee. An individual shall not be required to state a reason or otherwise justify his or her decision to be accompanied by another individual during the personal access to a record.

(g) Initial denial of access:

(1) Grounds. Access by an individual to a record which pertains to that individual will be denied only upon a determination by the PA Officer that:

 (i) The record is subject to an exemption under the Act and these rules;

(ii) The record is information compiled in reasonable anticipation of a civil

action or proceeding;

(iii) The provisions of § 1101.7(c) pertaining to medical records have been temporarily invoked; or

(iv) The individual unreasonably has failed to comply with the procedural

requirements of these rules.

(2) Notification. The PA Officer shall give notice of denial of access of records to the individual in writing and shall include the following information:

- (i) The PA Officer's name and title or position;
 - (ii) The date of denial;
- (iii) The reasons for the denial, including citation to the appropriate section of the Act and these rules;
- (iv) The individual's opportunities for further administrative consideration, including the identity and address of the responsible official;
- (v) If stated to be administratively final within the Section, the individual's right to judicial review under 5 U.S.C. 552a(g) (1) and (5).
- (3) Administrative review: When an initial denial of a request is issued by the PA Officer, the individual's opportunities for further consideration shall be as follows:
- (i) As to denial under paragraph (g)(1)(i) of this section, the sole procedure is a petition for the issuance, amendment, or repeal of a rule under 5 U.S.C. 553(e). Such petition shall be filed with the Commissioner, United States Section, International Boundary and Water Commission, 4171 North Mesa, Suite C-310, El Paso, TX 79902-1422. If the exception was determined by another agency, the PA Officer will provide the individual with the name and address of the other agency and any relief sought by the individual shall be that provided by the regulations of the other agency. Within the Section, no such denial is administratively final until such a petition has been filed by the individual and disposed of on the merits by the Commissioner.
- (ii) As to denial under paragraphs (g)(1), (ii), (iii) or (iv) of this section, the individual may file for review with the Commissioner, as indicated in the PA Officer's initial denial notification.
- (h) If a request is partially granted and partially denied, the PA Officer shall follow the appropriate procedures of this section as to the records within the grant and the records within the denial.

§ 1101.8 Disclosure of records to thirdparties.

- (a) The Section will not disclose any information about an individual to any person other than the individual except in the following instances:
- (1) Upon written request by the individual about whom the information is maintained;
- (2) With prior written consent of the individual about whom the information is maintained;
- (3) To the parent(s) of a minor child, or the legal guardian of an incompetent person, when said parent(s) or legal guardian act(s) on behalf of said minor or incompetent person.

(4) When permitted under 5 U.S.C. 552a(b) (1) through (11) which provides as follows:

(i) To those officers and employees of the agency which maintains the record who have a need for the record in the performance of their duties:

(ii) Required under 5 U.S.C. 552 of the

U.S. Code;

(iii) For a routine use as defined in the

Act at 5 U.S.C. 552a(a)(7);

(iv) To the Bureau of the Census for purposes of planning or carrying out a census or survey or related activity pursuant to the provisions of title 13 of the U.S. Code;

(v) To a recipient who has provided the agency with advance adequate written assurance that the record will be used solely as a statistical research or reporting record, and the record is to be transferred in a form that is not

individually identifiable;

(vi) To the National Archives of the United States as a record which has sufficient historical or other value to warrant its continued preservation by the United States Government, or for evaluation by the Administrator of General Services or his designee to determine whether the record has such

(vii) To another agency or to an instrumentality of any governmental jurisdiction within or under the control of the United States for a civil or criminal law enforcement activity if the activity is authorized by law, if the head of the agency or instrumentality has made a written request to the agency which maintains the record specifying the particular portion desired and the law enforcement activity for which the record is sought;

(viii) To a person pursuant to a showing of compelling circumstances affecting the health or safety of an individual if upon such disclosure notification is transmitted to the last known address of such individual;

(ix) To either House of Congress, or, to the extent of matter within its jurisdiction, any committee or subcommittee thereof, any joint committee of Congress or subcommittee of any such joint committee, and to a Congressman who is acting on behalf of his constituent;

(x) To the Comptroller General, or any of his authorized representatives, in the course of the performance of the duties of the General Accounting Office; or

(xi) Pursuant to the order of a court of

competent jurisdiction;

(5) When required by the Act and not covered explicitly by the provisions of 5 U.S.C. 552a(b). These situations include the following:

(i) Dissemination of a corrected or amended record or notation of a disagreement statement (5 U.S.C. 552a(c)(4));

(ii) Disclosure of records to an individual to whom they pertain (5

U.S.C. 552a(d));

(iii) Civil actions by an individual (5 U.S.C. 552a(g));

(iv) Release of records or information to the Privacy Protection Study Commission (Section 5 of Pub. L. 93-

(v) Fulfill the needs of Office of Management and Budget to provide continuing oversight and assistance to the section in implementation of the Act (Section 6 of Pub. L. 93-579).

§ 1101.9 Exemptions.

The following are exempt from disclosure under 5 U.S.C. 552a (j) and

(a) Any record originated by another agency which has determined that the record is exempt. If a request encompasses such a record, the Section will advise the requester of its existence, and of the name and address of the source agency.

(b) Records specifically authorized under criteria established by an executive order to be kept secret in the interest of national defense or foreign policy, and which are, in fact, properly classified pursuant to such executive

(c) Those systems of records listed as exempt in the Notice of Records of the Federal Register, including: Certificates of Medical Examination; Occupational Health and Injury Files; and Investigative Records.

§ 1101.10 Accounting for disclosures.

(a) Each system manager shall establish a system of accounting for all disclosures of records, either orally or in writing made outside the Section, unless otherwise exempted under this section. Accounting procedures may be established in the least expensive and most convenient form that will permit the PA Officer to advise individuals promptly upon request of the persons or agencies to which records concerning them have been disclosed. Accounting of disclosures made under 5 U.S.C. 552a(b)(7) relating to civil or criminal law enforcement activities shall not be made available to the individual named in the record.

(b) Accounting records, at a minimum, shall include the date, nature, and purpose of each disclosure of a record and the name and address of the person or agency to whom the disclosure was made. Accounting records shall be

maintained for at least five years or the life of the record, whichever is longer.

(c) Accounting is not required to be kept for disclosure made within the Section or disclosures made pursuant to the Freedom of Information Act.

(d) If an accounting of the disclosure was made, the PA Officer shall inform any person or other agency about any correction or notation of dispute made by the Section in accordance with 5 U.S.C. 552a(d) of any record that has been disclosed to the person or agency.

§ 1101.11 Fees.

(a) Under the Act, fees can only be charged for the cost of copying records. No fees may be charged for the time it takes to search for the records or for the time it takes to determine if any exemptions apply. The Section will not charge a fee for the first copy of an individual's personnel record.

(b) The Section will charge a fee of \$0.10 per page for copies of documents which are identified by an individual and reproduced at the individual's request for retention, except that there will be no charge for requests involving costs of \$1.00 or less, but the copying fees for contemporaneous request by the same individual shall be aggregated to determine the total fee.

(c) Special and additional services provided at the request of the individual, such as certification or authentication, will be charged to the individual in accordance with other published regulations of the Section pursuant to statute (for example, 22 CFR part 1102-Freedom of Information Act.)

(d) Remittances shall be in the form of either a personal check or bank draft drawn on a bank in the United States, a postal money order, or cash. Remittance shall be made payable to the order of the U.S. Section, International Boundary and Water Commission, and delivered to or mailed to the PA Officer, United States Section, International Boundary and Water Commission, 4171 North Mesa, Suite C-310, El Paso, TX 79902-1422. The Section will assume no responsibility for cash sent by mail.

(e) A receipt for fees paid will be given only upon request.

§ 1101.12 Request to correct or amend a

(a) Any individual may submit a request for correction of or amendment to a record to the Section. The request should be made either in person or by mail addressed to the PA Officer who processed the individual's request for access to the record, and to whom is delegated authority to make initial

determinations on requests for correction or amendment.

- (b) Since the request, in all cases, will follow a request for access under § 1101.6, the individual's identity will be established by his or her signature on the request.
- (c) A request for correction or amendment should be in writing. The envelope containing the request should be marked "Privacy Act Amendment Request" on the lower left hand corner. The request should include the following:
- (1) First, the letter should state that It is a request to amend a record under the Privacy Act of 1974.
- (2) Second, the request should identify the specific record and the specific information in the record for which an amendment is being sought.

(3) Third, the request should state why the information is not accurate, relevant, timely, or complete. Supporting evidence may be included with the request.

- (4) Fourth, the request should state what new or additional information, if any, should be included in place of the erroneous information. Evidence of the validity of new or additional information should be included. If the information in the file is wrong and needs to be removed rather than supplemented or corrected, the request should make this clear.
- (5) Fifth, the request should include the name, address, and telephone number (optional) of the requester.

§ 1101.13 Agency review of request to correct or amend a record.

- (a) (1) Not later than ten (10) days (excluding Saturdays, Sundays and holidays) after receipt of a request to correct or amend a record, the PA Officer shall send an acknowledgment providing an estimate of time within which action will be taken on the request and asking for such further information as may be necessary to process the request. The estimate of time may take into account unusual circumstances as described in § 1101.7(a). No acknowledgment will be sent if the request can be reviewed, processed and the individual notified of the results of review (either compliance or denial) within ten (10) days (excluding Saturdays, Sundays and holidays). Requests filed in person will be acknowledged in writing at the time submitted.
- (2) Promptly after acknowledging receipt of a request, or after receiving such further information as might have been requested, or after arriving at a decision within ten (10) days, the PA Officer shall either.

- (i) Make the requested correction or amendment and advise the individual in writing of such action, providing either a copy of the corrected or amended record or a statement as to the means whereby the correction or amendment was effected in cases where a copy cannot be provided (for example, erasure of information from a record maintained only in an electronic data bank); or
- (ii) Inform the individual in writing that his or her request is denied and provide the following information:
- (A) The PA Officer's name, title and position;
 - (B) The date of denial;
- (C) The reasons for the denial, including citation to the appropriate sections of the Act and these rules;
- (D) The procedures for appeal of the denial as set forth in § 1101.14.

The term promptly in this paragraph means within thirty (30) days (excluding Saturdays, Sundays and holidays). If the PA Officer cannot make the determination within thirty (30) days, the individual will be advised in writing of the reason therefor and of the estimated date by which the determination will be made.

- (b) Whenever an individual's record is corrected or amended pursuant to a request by that individual, the PA Officer shall notify all persons and agencies to which copies of the record had been disclosed prior to its correction or amendment, if an accounting of such disclosure required by the Act was made. The notification shall require a receipt agency maintaining the record to acknowledge receipt of the notification, to correct or amend the record, and to apprise any agency or person to which it has disclosed the record of the substance of the correction or amendment.
- (c) The following criteria will be considered by the PA Officer in reviewing a request for correction or amendment.
- The sufficiency of the evidence submitted by the individual;
- (2) The factual accuracy of the information;
- (3) The relevance and necessity of the information in terms of purpose for which it was collected.
- (4) The timeliness and currency of the information in light of the purpose for which it was collected;
- (5) The completeness of the information in terms of the purpose for which it was collected;
- (6) The degree of possibility that denial of the request could unfairly result in determinations adverse to the individual;

- (7) The character of the record sought to be corrected or amended; and
- (8) The propriety and feasibility of complying with the specific means of correction or amendment requested by the individual.
- (d) The Section will not undertake to gather evidence for the individual, but does reserve the right to verify the evidence which the individual submits.
- (e) Correction or amendment of a record requested by an individual will be denied only upon a determination by the PA Officer that:
- (1) The individual has failed to establish, by a preponderance of the evidence, the propriety of the correction or amendment in light of the criteria set forth in paragraph (c) of this section;
- (2) The record sought to be corrected or amended was compiled in a terminated judicial, quasi-judicial or quasi-legislative proceeding to which the individual was a party or participant;
- (3) The record sought to be corrected or amended is the subject of a pending judicial, quasi-judicial or quasilegislative proceeding to which the individual is a party or participant;
- (4) The correction or amendment would violate a duly enacted statute or promulgated regulation; or
- (5) The individual unreasonably has failed to comply with the procedural requirements of these rules.
- (f) If a request is partially granted and partially denied, the PA Officer shall follow the appropriate procedures of this section as to the records within the grant and the records within the denial.

§ 1101.14 Appeal of agency decision not to correct or amend a record.

(a) An appeal of the initial refusal to amend a record under § 1101.13 may be requested by the individual who submitted the request. The appeal must be requested in writing, and state that the appeal is being made under the Privacy Act of 1974, it should identify the denial that is being appealed and the records that were withheld, it should include the requester's name and address and telephone number (optional), and it should be signed by the individual making the request. It should be received by the Section within sixty (60) calendar days of the date the individual is informed of the PA Officer's refusal to amend a record in whole or in part. The request should be addressed and sent via certified mail to the Commissioner, United States Section, International Boundary and Water Commission, 4171 North Mesa, suite C-310, El Paso, TX 79902-1422. The processing of appeals will be facilitated

if the words "PRIVACY APPEAL" appear in capital letters on both the envelope and the top of the appeal papers. An appeal not addressed and marked as provided herein will be marked by Section personnel when it is so identified and will be forwarded immediately to the Commissioner.

(b) The time for decision on the appeal begins on the date the appeal is received by the Commissioner. The appeal should include any documentation, information or statements advanced for the amendment

of the record.

(c) There shall be a written record of the reason for the final determination. The final determination will be made not later than thirty (30) days (excluding Saturdays, Sundays and holidays) from the date the Commissioner receives the appeal; unless, for good cause shown, the Commissioner extends such determination beyond the thirty (30) day period.

(d) When the final determination is that the record should be amended in accordance with the individual's request, the Commissioner shall direct the office responsible for the record to comply. The office responsible for the

record shall:

(1) Amend the record as directed; (2) If a distribution of the record has been made, advise all previous recipients of the record of the amendment and its substance;

(3) So advise the individual in writing.

(e) When the final decision is that the request of the individual to amend the record is refused, the Commissioner shall advise the individual:

(1) Of the refusal and the reasons for

(2) Of his or her right to file a concise statement of the reasons for disagreeing with the decision of the Section;

(3) Of the procedures for filing the statement of disagreement;

(4) That the statement which is filed will be made available to anyone to whom the record is subsequently disclosed together with, at the discretion of the Section, a brief statement by the Section summarizing its reasons for refusing to amend the record;

(5) That prior recipients of the disputed record will be provided a copy of any statement of dispute to the extent that an accounting of disclosures was

maintained; and

(6) Of his or her right to seek judicial review of the Section's refusal to amend the record.

(f) When the final determination is to refuse to amend a record and the individual has filed a statement under paragraph (e)(2) of this section, the Section will clearly annotate the record

so that the fact that the record is disputed is apparent to anyone who may subsequently have access to use or disclose it. When information that is the subject of a statement of dispute filed by an individual is subsequently disclosed. the Section will note that the information is disputed and provide a copy of the individual's statement. The Section may also include a brief summary of the reasons for not making a correction when disclosing disputed information. Such statements will normally be limited to the reasons given to the individual for not amending the record. Copies of the Section's statement shall be treated as part of the individual's record for granting access; however, it will not be subject to amendment by the individual under these rules.

(g) An appeal will be decided on the basis of the individual's appeal papers and the record submitted by the PA officer. No personal appearance or hearings on appeals will be allowed.

§ 1101.15 Judicial review.

After having exhausted all administrative remedies set forth in § 1101.7(g)(3) or § 1101.14, a requester may bring a civil action against the Section, in a United States District Court of proper venue, within two years of the final administrative decision which the requester seeks to challenge.

§ 1101.16 Criminal penalties.

(a) Under the provisions of the Act, it is a Federal crime for any person to knowingly and willfully request or obtain information from a Federal agency, including this Section, by false pretenses.

(b) It is also a crime for any officer or employee of the Section to knowingly and willfully:

and willfully:

(1) Make an unauthorized disclosure;

(2) Fail to publish public notice of a system of records as required by 5 U.S.C. 552a(e)(4).

§ 1101.17 Annual report to Congress.

(a) On or before August 1 of each calendar year the Commissioner shall submit a report covering the preceding calendar year to the Speaker of the House of Representatives and the President of the Senate for referral to the appropriate committees of the Congress. The report shall include:

 The U.S. Section's point of contact responsible for implementing the

Privacy Act of 1974;

(2) The number of active systems, new systems published, systems deleted, systems automated, either in whole or part, number of existing systems for which new routine uses were
established, number of existing systems
for which new exemptions were
claimed, number of existing systems
from which exemptions were deleted,
and number of public comments
received by the agency of publication of
rules or notices;

(3) Total number of requests for access, number of requests wholly or partially granted, number of requests totally denied, number of requests for which no record was found, number of appeals of denials of access, number of appeals in which denial was upheld, number of appeals in which denial was overturned either in whole or part, number of requests to amend records in system, number of amendment requests wholly or partially granted, number of amendment requests totally denied. number of appeals of denials of amendment requests, number of appeals in which denial was upheld, number in which denial was overturned either in whole or in part, whether the U.S. Section denied an individual access to his or her records in a system of record on any basis other than a Privacy Act exemption under 5 U.S.C. 552(j) or (k), and the legal justification for the denial, number of instances in which individuals litigated the results of appeals of access or amendment, and the results of such litigation, and a statement of our involvement in matching programs;

(4) Any other information which will indicate the U.S. Section's effort to comply with the objectives of the Act, to include any problems encountered, with recommendations for solving thereof;

(5) And, a copy of these regulations. Reinaldo Martinez,

FOIA/Privacy Act Officer. [FR Doc. 92–13801 Filed 6–11–92; 8:45 am] BILLING CODE 4710–03–M

DEPARTMENT OF TRANSPORTATION

Coast Guard

33 CFR Part 100

[CGD1 92-015]

Great Kennebec River Whatever Race, Kennebec River, Maine

AGENCY: Coast Guard, DOT.

ACTION: Implementation of rule.

SUMMARY: This document puts into effect the permanent regulations, 33 CFR 100.108, for the Great Kennebec River Whatever Race to be held on Sunday, July 5, 1992 from 6 a.m. to 6 p.m. The regulations in 33 CFR 100.108 are

necessary in order to control vessel traffic within the immediate vicinity of the event due to the confined nature of the waterway and the anticipated congestion at the time of the event. The purpose of this regulation is to provide for the safety of life and property on navigable waters during the event.

EFFECTIVE DATE: The regulations, 33 CFR 100.108 are effective from 6 a.m. to 6 p.m. on Sunday, July 5, 1992 and will be in effect each year thereafter during the same time period on the first Sunday of July or as published in a Federal Register notice and the Coast Guard Local Notice to Mariners.

FOR FURTHER INFORMATION CONTACT: Lieutenant (junior grade) Eric G.

Westerberg, Chief, Boating Safety Affairs Branch, First Coast Guard District, (617) 223–8310.

SUPPLEMENTARY INFORMATION: This notice provides the effective period for the permanent regulation governing the 1992 running of the Great Kennebec River Whatever Race, Augusta to Gardiner, Maine. The regulations, 33 CFR 100.108, will be in effect from 6 a.m. on July 5, 1992 through 6 p.m. on July 5, 1992. A portion of the Kennebec River will be closed during this time to all vessel traffic except participants, official regatta vessels, and patrol craft. The regulated area is that portion of the Kennebec River, extending bank to bank, between the Maine Route 126 Bridge (connecting Randolph and Gardiner, Maine), to the U.S. Route 201-202 bridge in Augusta, Maine. Further public notification, including the full text of the regulations will be accomplished through advance notice in the First Coast Guard District Local Notice to Mariners.

Drafting Information

The principal persons involved in drafting this document are LTJG E.G. Westerberg, Project Manager, First Coast Guard District Boating Safety Division, and LCDR J. Astley, Project Attorney, First Coast Guard District Legal Division.

Dated: June 1, 1992.

J.D. Sipes,

Rear Admiral, U.S. Coast Guard, Commander, First Coast Guard District.

33 CFR Part 165

[COTP Baltimore, Regulation 92-05-12]

Security Zone Regulations: Severn River, Annapolis, MD

AGENCY: Coast Guard, DOT.

ACTION: Temporary final rule.

summary: The Coast Guard is establishing a security zone in the Severn River, Annapolis, Maryland. The security zone is needed to protect the participants attending the SEALINK 92 Symposium being sponsored by the Government of the United States from sabotage or other subversive acts, accidents, or other causes of a similar nature. Entry in this zone is prohibited unless authorized by the Captain of the Port or his authorized representative.

effective each day from 6 a.m. to 11:59 p.m., June 17 through June 20, 1992 unless sooner terminated by the Captain of the Port, Baltimore, Maryland.

FOR FURTHER INFORMATION CONTACT: MSTC C. R. Moberg, at U.S.C.G. Marine Safety Office, Custom House, 40 South Gay Street, Baltimore, Maryland 21202– 4022, (410) 962–5105.

SUPPLEMENTARY INFORMATION: In accordance with 5 U.S.C. 553, a notice of proposed rulemaking (NPRM) was not published for this regulation and good cause exists for making it effective in less than 30 days from the date of Federal Register publication. Publishing an NPRM and delaying the effective date of this security zone would be contrary to the public interest since immediate action is needed to protect the participants attending the SEALINK 92 Symposium from injury due to sabotage or other subversive acts.

Drafting Information

The drafters of this regulation are MSTC C. R. Moberg, project officer for the Captain of the Port, Baltimore, Maryland and LT M. L. Lombardi, Project Attorney, Fifth Coast Guard District Legal Staff.

Discussion of Regulation

The Coast Guard is establishing a security zone in the Severn River, Annapolis, Maryland, to protect the participants attending the SEALINK 92 Symposium being sponsored by the Government of the United States from sabotage or other subversive acts, accidents, or other causes of a similar nature. The symposium will be held at the U.S. Naval Academy from June 17, 1992 through June 20, 1992. No vessels will be allowed to enter or operate within the security zone except by specific permission and direction from the Captain of the Port or representative of the Captain of the Port. Coast Guard vessels will be on scene to notify boaters of restrictions and to enforce the security zone.

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Security measures, Vessels, Waterways.

Regulation

In consideration of the foregoing, subpart D of part 165 of title 33, Code of Federal Regulations, is amended as follows:

1. The authority citation for part 165 continues to read as follows:

Authority: 33 U.S.C. 1231; 50 U.S.C. 191; 33 CFR 1.05–1(g), 6.04–1, 6.04–6, and 160.5; 49 CFR 1.46.

2. A new § 165.T0512 is added to read as follows:

§ 165.T0512 Security Zone: Severn River and Annapolis Harbor, Annapolis, Maryland.

(a) Location. The following area is a security zone: The waters of the Severn River and College Creek bounded by the Naval Academy seawall, and a line connecting the following points:

Longitude
29° 09.1" W.
29' 04.3" W.
28' 58.1" W.

(b) Effective Times. This area is effective each day from 6 a.m. to 11:59 p.m., June 17 through June 20, 1992.

- (c) Representative of the Captain of the Port. A "representative of the Captain of the Port" is any uniformed United States Coast Guard commissioned, warrant, or petty officer who has been designated by the Captain of the Port, Baltimore, Maryland to act on his behalf with respect to this zone.
- (d) Regulations. (1) No person or vessel may enter, or operate in the security zone without the permission of the Captain of the Port or a representative of the Captain of the Port.
- (2) Each person and vessel in the security zone shall immediately obey any direction or order of the Captain of the Port or any representative of the Captain of the Port.
- (3) For further information contact the Coast Guard Marine Safety Office, Baltimore, at (410) 962–5100 or the on scene Coast Guard patrol vessels on VHF FM 16.
- (4) The general regulations in § 165.33 of this part do not apply to this security zone.

Dated: June 8, 1992.

33 CFR Part 165

[COTP Louisville, Kentucky Regulation 92-04]

Safety Zone Regulations; Ohio River Mile 603.7 to 604.3

AGENCY: Coast Guard, DOT.
ACTION: Temporary final rule.

SUMMARY: The Coast Guard is establishing a safety zone for the Ohio River, mile 603.7 to 604.3. The zone is needed to protect all vessels and spectators from a safety hazard associated with the Louisville City Fair fireworks display. Entry into this zone is prohibited unless authorized by the Captain of the Port Louisville, Kentucky.

EFFECTIVE DATE: This regulation becomes effective at 9:45 pm EDST on 14 June 1992. It terminates at 10:20 pm EDST on 14 June 1992 unless sooner terminated by the Captain of the Port Louisville, Kentucky.

FOR FURTHER INFORMATION CONTACT: Lieutenant Dale L. Hutchinson, (502) 582-5194.

SUPPLEMENTARY INFORMATION: In accordance with 5 U.S.C. 553, a notice of proposed rulemaking was not published for this regulation and good cause exists for making it effective in less than 30 days after Federal Register publication due to the short notice of the incident. Publishing an NPRM and delaying its effective date would be contrary to the public interest since immediate action is needed to prevent damage to the vessels involved.

Drafting Information

The drafters of this regulation is Lieutenant Dale L. Hutchinson, project officer for the Captain of the Port Louisville, Kentucky,

Discussion of Regulation

The event requiring this regulation will begin on 14 June 1992 at 10 pm EDST and end on 14 June 1992 at 10:20 pm EDST. The fireworks display will take place at mile 603.9 on the Ohio River. The river closure is needed to protect river traffic and spectators. The Captain of the Port Louisville, Kentucky representative may be contacted on VHF radio Channel 16 during the event.

This regulation is issued pursuant to 33 U.S.C. 1225 and 1231 as set out in the authority citation for all of Part 165.

Lists of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Security measures, Vessels, Waterways.

Regulation

In consideration of the foregoing, subpart C of part 165 of title 33, Code of Federal Regulations, is amended as follows:

PART 165-[AMENDED]

1. The authority citation for part 165 continues to read as follows:

Authority: 33 U.S.C. 1225 and 1231; 50 U.S.C. 191; 49 CFR 1.46 and 33 CFR 1.05–1(g). 6.04–1, 6.04–6, and 160.5.

2. A new § 165.T0226 is added to read as follows:

§ 165.T0226 Safety Zone: Ohio River from Mile 603.7 to 604.3.

(a) Location. The following area is a safety zone: All waters of the Ohio River Mile 603.7 to 604.3.

(b) Effective Date. This regulation becomes effective at 9:45 pm EDST on 14 June, 1992. It terminates at 10:20 pm EDST on 14 June 1992, unless sooner terminated by the Captain of the Port Louisville, Kentucky.

(c) Regulations. In accordance with the general regulations in Section 165.23 of this part, entry into this zone is prohibited unless authorized by the Captain of the Port Louisville, Kentucky, or a Coast Guard Commissioned, Warrant, or Petty Officer designated by

Dated: June 1, 1992.

W.J. Morani, Ir.,

Commander, U.S. Coast Guard, Captain of the Port, Louisville, Kentucky.

BILLING CODE 4910–14-M

DEPARTMENT OF EDUCATION

34 CFR Part 671

RIN 1840-AA69

Foreign Periodicals Program

AGENCY: Department of Education.
ACTION: Final regulations.

SUMMARY: The Secretary issues regulations to govern the Foreign Periodicals Program. These regulations are needed to implement section 607 of the Higher Education Act of 1965 (HEA), as amended by the Higher Education Amendments of 1986. The Foreign Periodicals Program is intended to provide a framework for strengthening specialized library collections dealing with foreign area studies and world affairs.

EFFECTIVE DATE: These regulations take effect either 45 days after publication in the Federal Register or later if Congress

takes certain adjournments. If you want to know the effective date of these regulations, call or write the Department of Education contact person. A document announcing the effective date will be published in the Federal Register.

FOR FURTHER INFORMATION CONTACT: Joseph F. Belmonte, Deputy Director, Center for International Education, U.S. Department of Education, room 3053, ROB 3, 400 Maryland Avenue SW., Washington, DC 20202–5248. Telephone: 202–708–7283. Deaf and hearing impaired individuals may call the Federal Dual Party Relay Service at 1–800–877–8339 (in the Washington, DC 202 area code, telephone 708–9300) between 8 a.m. and 7 p.m., Eastern time:

SUPPLEMENTARY INFORMATION: Under the Poreign Periodicals Program, the Secretary awards grants to institutions of higher education, public or nonprofit private library institutions, or consortia of these institutions. To receive a grant, an applicant must have an established library or consortium of libraries with collection strengths in specific geographical areas of the world or in particular fields or issues in world affairs that concern one or more countries, or both. The applicant also must demonstrate a commitment to share the resources of its collection.

Grant funds may be used: (1) To acquire periodicals published outside the United States that are not commonly held by American academic libraries and that are of scholarly or research importance; (2) to preserve those periodicals; (3) to make those periodicals available to researchers and scholars; and (4) to maintain machine-readable bibliographic information on the acquired periodicals and to enter that information into one or more of the widely available bibliographic data bases.

On December 29, 1987, the Secretary published a notice of proposed rulemaking (NPRM) for the Foreign Periodicals Program in the Federal Register (52 FR 49122). Final regulations were not adopted because the program was not funded until FY 1992. There are no significant differences between the NPRM and these final regulations.

Analysis of Comments and Changes

In response to the Secretary's invitation in the NPRM, nine parties submitted comments on the proposed regulations. An analysis of the comments and of the changes made in the regulations since the publication of the NPRM follows.

Substantive issues are discussed under the section of the regulations to which they pertain. Technical and other minor changes—and suggested changes the Secretary is not legally authorized to make under the applicable statutory authority—are not addressed.

Section 671.1—What is the Foreign Periodicals Program?

Comment: One commenter suggested the addition of the phrase "in the region of the recipient" to the end of paragraph (a) of § 671.1, to ensure the availability of specialized collections in more than one region of the United States.

Discussion: The Secretary believes that developing specialized collections in more than one region of the United States is consistent with the program's goal of helping to develop national resources, and the Secretary intends to make grant awards that are consistent with this goal. Thus, an application should include a description of any special or regional needs in a persuasive way and relate them to national needs. These factors will be considered in the evaluation of applications under § 671.11, particularly paragraphs (f) and (g) of that section.

Changes: None.

Section 671.2—Who Is Eligible for an Award?

Comment: One commenter urged that specialized, "affiliated," or branch libraries within a single university be eligible to apply "as their collections fit the eligibility criteria and the priorities" outlined in the proposed regulations.

Discussion: The authorizing statute, 20 U.S.C. 1125a, provides that eligible applicants are institutions of higher education, public or nonprofit private library institutions, and consortia of these institutions, and these provisions are reflected in § 671.2. The Secretary anticipates that the wording of this section will permit the strengthening of whatever collections the institution may choose, subject (as the commenter notes) to the "criteria and the priorities" of the program. Applications prepared by individual units of a university must be submitted under the authority of the university's central administration.

Changes: None.

Comment: A commenter requested the addition of the phrase "with a basic collection and the demonstrated intent to develop" to paragraph (a) of § 671.2 with a view to encouraging institutions that have made an initial investment in a new field.

Discussion: The current wording of the paragraph, which is drawn from 20 U.S.C. 1125a(c), indicates that the library itself must be established but does not

specify that any minimum strength would be required in the specialized collection at the time the application is submitted. The competitive process is likely to determine the level of collection development that might be needed for an institution to receive title VI funds.

Changes: None.

Comment: In relation to paragraph (b), one commenter expressed concern that grantees might be permitted to exercise discriminatory lending practices, to refuse to lend to certain borrowers, or to impose excessive charges on those using the federally funded collections.

Discussion: Under § 671.2(b), an institution is eligible for a grant only if it demonstrates a commitment to share the resources of its library collection with researchers and scholars. The Secretary agrees that this program should not in any way sanction restrictive, unreasonable, or costly lending or dissemination practices. However, these issues are more appropriately dealt with through the grant application, review, and monitoring processes.

Changes: None.

Section 671.3—What Activities May the Secretary Fund?

Comment: Three commenters expressed concern about the content of paragraph (a). One noted that the library community has no absolute definition of periodicals that are "not commonly held" and urged flexibility in applying this requirement. All three noted the importance of continuity in the acquisition of periodicals, in contrast with the unpredictability of annual funding patterns. Two suggested that, under these circumstances, the program might focus on the acquisition of backfiles.

Discussion: The Secretary recognizes that flexibility and continuity will be important considerations in the administration of the program. The wording of the regulations does not prevent the acquisition of backfiles.

Changes: None.

Comment: Two commenters emphasized the importance of cooperative projects in conjunction with the bibliographic information activity described in paragraph (d). One commenter suggested the addition, to paragraph (d), of "described in paragraph (a) of this section" to assure that information about acquisitions funded under this program is disseminated.

Discussion: The Secretary wishes to encourage cooperative bibliographic efforts to acquire foreign periodicals. Because entering appropriate information about acquisitions in national bibliographic database networks is an important kind of cooperation, it would be unwise to limit funding for these cooperative bibliographic efforts to periodicals purchased under this program.

Changes: None.

Section 671.5-What Definitions Apply?

Comment: One commenter urged the expansion of the definition of "foreign periodical" in paragraph (b) by the addition of "or other serial publication of a continuing nature" to clarify the scope of the program.

Discussion: The Secretary finds that this addition would not clarify the scope of the program. A publication issued serially and on a continuing basis would

be considered a periodical.

Changes: The definition has been revised to clarify that the foreign periodicals referred to in this part must be produced outside the United States as well as published there. This requirement was contained in § 671.3(a) of the proposed regulations, and the change is therefore technical in nature. Conforming changes have been made in §§ 671.1(a), 671.3(a), and 671.20(a).

Section 671.11—What Selection Criteria Does the Secretary Use?

Comment: Two commenters, focusing on paragraph (g)(1), suggested replacing "serve national needs" with "support the goals of Title VI of the Higher Education Act," citing the 1986 report of the House of Respresentatives' Committee on Education and Labor.

Discussion: The phrase "serve national needs" is intended to embrace the overall purposes of the program, which are described in section 601 of the Higher Education Act.

Changes: Section 671.11(g)(1) has been revised to refer to the statutory provision that contains the findings and purposes applicable to the program.

Comment: One commenter expressed concern that the phrase "available at the institution" in paragraph (g)(2) of this section might not require the periodicals to be available beyond the institution.

Discussion: The intent of the paragraph is, as the commenter recognized, to emphasize the need for preservation of the periodicals; the dissemination function of the program is covered in paragraphs (g)(3) and (h).

Changes: None.

Comment: In conjunction with paragraph (h), one commenter noted the importance of flexibility in evaluation plans for dissemination activities, particularly emphasizing the timeliness of responses to resource-sharing questions and the extent to which the bibliographic records will be available beyond the institution holding the periodicals.

Discussion: The Secretary agrees that flexibility will be important in evaluating the quality of services that an applicant proposes to provide, and an application should contain a detailed statement of proposed dissemination activities.

Changes: None.

Comment: Three commenters urged the deletion of paragraph (i) dealing with priorities. They argued that it undermines continuing funding for periodicals, which they regarded as an important objective of the program.

Discussion: The regulations do not require that priorities be established, but simply make it possible to establish priorities if they are desired.

Changes: None.

Section 671.12—What Priorities May the Secretary Establish?

Comment: With arguments similar to those for the previous paragraph, four commenters urged the deletion of this section. The Secretary's priorities, it was suggested, might change from year to year, thus working against the need for multi-year funding for the acquisition of increasingly expensive foreign periodicals.

Discussion: Potential applicants are reminded that appropriations for programs are made on an annual basis and that, therefore, it will be difficult to ensure the kind of long-term, multi-year support the commenters envision. However, the Secretary will consider soliciting applications for multi-year project periods to address commenters' concerns. Under 34 CFR 75.101(a)(3), the Secretary announces any multi-year project period in the application notice published in the Federal Register.

Changes: Section 671.12 has been revised to clarify the priority categories addressed by this provision.

Section 671.20—What Costs are Allowable?

Comment: Two commenters urged that grant funds be allowed to pay for staff salaries for the indexing and analytical work needed to prepare the bibliographies envisioned under § 671.3(d).

Discussion: The Secretary agrees that funds for staff salaries should be allowable for these purposes. The standards for allowable costs are referenced in the Education Department General Administrative Regulations, 34 CFR 74.170–74.176.

Changes: Section 671.20 has been revised to permit grant funds to be used for purposes necessary to carry out any of the authorized activities described in \$ 671.3.

Comment: Two commenters expressed concern that travel expenditures not be allowed to "intrude unduly into the very modest levels of assistance likely to be available."

Discussion: The Secretary agrees that travel should make up a relatively low percentage of the expenditures in this program. This can be managed, however, through the usual grant negotiation process.

Changes: None.

Section 671.21—What are the Limitations on Allowable Costs?

Comment: Two commenters expressed concern about paragraph (b), with one suggesting provision for a waiver of the prohibition on supplanting funds. Problems with fluctuations of the purchasing power of the dollar and other circumstances beyond the control of the institution were noted.

Discussion: The Secretary recognizes that where institutional purchasing power is rapidly diminishing, the proposed prohibition on supplanting funds might lead to inequitable results and he believes the prohibition should be modified.

Changes: Section 671.21(b) has been revised to prohibit the use of grant funds to supplant funds that would be made available by recipients for the purposes of part 671 in the absence of the grant.

Comment: In addition, several commenters stressed the importance of adding a provision for multi-year funding, as it would help provide continuity in purchasing periodicals that become available only over an extended period of time.

Discussion: The provisions of 34 CFR part 75 (Direct Grant Programs) govern awards under this program, and § 75.250 permits the Secretary to approve a project period of up to 60 months. The duration of projects, as well as probable funding levels, will be described in any application notice.

Changes: None.

Other changes: Section 671.4 has been updated to reflect changes in the Education Department General Administrative Regulations (EDGAR).

Executive Order 12291

These regulations have been reviewed in accordance with Executive Order 12291. They are not classified as major because they do not meet the criteria for major regulations established in the order.

Assessment of Education Impact

In the notice of proposed rulemaking, the Secretary requested comments on whether the proposed regulations would require transmission of information that is being gathered by or is available from any other agency or authority of the United States.

Based on the response to the proposed rules and on its own review, the Department has determined that the regulations in this document do not require transmission of information that is being gathered by or is available from any other agency or authority of the United States.

(Catalog of Federal Domestic Assistance Number 84.251—Foreign Periodicals Program)

Dated: June 8, 1992.

Lamar Alexander,

Secretary of Education.

The Secretary amends title 34 of the Code of Federal Regulations by adding a new part 671 to read as follows:

PART 671—FOREIGN PERIODICALS PROGRAM

Subpart A-General

Sec

671.1 What is the Foreign Periodicals
Program?

671.2 Who is eligible for an award? 671.3 What activities may the Secretary fund?

671.4 What regulations apply? 671.5 What definitions apply?

Subpart B—How Does the Secretary Make an Award?

671.10 How does the Secretary evaluate an application?

671.11 What selection criteria does the Secretary use?

671.12 What priorities may the Secretary establish?

Subpart C—What Conditions Must be Met by a Grantee?

671.20 What costs are allowable? 671.21 What are the limitations on allowable costs?

Authority: 20 U.S.C. 1125a, unless otherwise noted.

Subpart A-General.

§ 671.1 What is the Foreign Periodicals Program?

Under the Foreign Periodicals
Program, the Secretary awards grants to
selected institutions of higher education,
public or nonprofit private library
institutions, or consortia of these
institutions, for the purpose of—

(a) Acquiring foreign periodicals that are not commonly held by American academic libraries and that are of scholarly or research importance;

(b) Preserving those periodicals;
(c) Making those periodicals available

to researchers and scholars; and

(d) Maintaining machine-readable bibliographic information on acquired periodicals and entering that information into one or more of the widely available bibliographic databases.

(Authority: 20 U.S.C. 1125a)

§ 671.2 Who is eligible for an award?

An institution of higher education, a public or nonprofit private library institution, or a consortium of these institutions is eligible to receive a grant under this part if the institution or consortium—

(a) Has an established library with strengths in either—

(1) Specific geographical areas of the

(2) Particular fields or issues in world affairs that concern one or more countries; or

(3) Both; and

(b) Demonstrates a commitment to share the resources of its library collection with researchers and scholars.

(Authority: 20 U.S.C. 1125a)

§ 671.3 What activities may the Secretary fund?

Grants awarded under this part may be used to—

(a) Acquire foreign periodicals that are not commonly held by American academic libraries and that are of scholarly or research importance;

(b) Preserve the periodicals described in paragraph (a) of this section;

(c) Make the periodicals described in paragraph (a) of this section available to researchers and scholars; and

(d) Maintain machine-readable bibliographic information on acquired periodicals and enter that information into one or more of the widely available bibliographic databases.

(Authority: 20 U.S.C. 1125a)

§ 671.4 What regulations apply?

The following regulations apply to the Foreign Periodicals Program:

(a) The Education Department General Administrative Regulations (EDGAR) as follows:

(1) 34 CFR part 74 (Administration of Grants to Institutions of Higher Education, Hospitals, and Nonprofit Organizations).

(2) 34 CFR part 75 (Direct Grant

Programs).

(3) 34 CFR part 77 (Definitions that Apply to Department Regulations).

(4) 34 CFR part 82 (New Restrictions on Lobbying).

(5) 34 CFR part 85 (Governmentwide Debarment and Suspension (Nonprocurement) and Governmentwide Requirements for Drug-Free Workplace (Grants)).

(6) 34 CFR part 86 (Drug-Free Schools

and Campuses).

(b) 34 CFR part 655.

(c) The regulations in this part 671. (Authority: 20 U.S.C. 1125a)

§ 671.5 What definitions apply?

The following definitions apply to this part:

(a) The definitions in 34 CFR 655.4.

(b) Other definitions. The following definition also applies to this part:

Foreign periodical means a periodical produced and published outside the United States.

(Authority: 20 U.S.C. 1125a)

Subpart B—How Does the Secretary Make an Award?

§ 671.10 How Does the Secretary evaluate an application?

(a) The Secretary evaluates an application on the basis of the criteria in § 671.11.

(b) The Secretary awards up to 100

points for these criteria.

(c) The Secretary may award up to 20 additional points under the criterion in § 671.11(i) (degree to which priorities are served).

(d) The maximum possible score for each criterion is indicated in

parentheses.

(Authority: 20 U.S.C. 1125a)

§ 671.11 What selection criteria does the Secretary use?

The Secretary uses the following criteria to evaluate an application:

(a) Plan of operation (15 points). (See

34 CFR 655.31(a).)
(b) Quality of key personnel (10

points). (See 34 CFR 655.31(b).)
(c) Budget and cost-effectiveness (5

points). (See 34 CFR 655.31(c).) (d) Evaluation plan (5 points). (See 34

CFR 655.31(d).)
(e) Adequacy of resources (10 points).
(See 34 CFR 655.31(e).)

(f) Commitment to the subject area on which the project focuses (25 points). The Secretary reviews each application to determine—

 The strength of the institution's library in the area on which the project focuses; and

(2) The extent to which the institution provides financial and other support to the project, adequate staffing, and services for researchers and scholars in fields related to the project.

(g) Need and potential impact (15 points). The Secretary reviews each application to determine—

(1) The extent to which the proposed activities serve national needs, as described in section 601 of the Higher Education Act.

(2) The extent to which an improved collection will be available at the applicant institution at the conclusion of the grant period; and

(3) The potential effect of the proposed project in improving the knowledge of languages, areas, or international studies at the national level.

(h) Dissemination activities (15 points). The Secretary reviews each application to determine the quality of the services the project would provide to researchers and scholars.

(i) Degree to which priorities are served (20 points). If, under the provisions of § 671.12, the application notice lists specific priorities for this program, the Secretary determines the degree to which those priorities are served.

(Approved by the Office of Management and Budget under control number 1840–0609) (Authority: 20 U.S.C. 1125a)

§ 671.12 What priorities may the Secretary establish?

- (a) The Secretary each year may select as a priority the collection of periodicals dealing with one or more of the following categories:
- (1) Specific countries or geographical regions, such as Mexico or South Asia.
- (2) Specific fields or issues in world affairs, such as business, energy, environmental affairs, military and security programs, or development issues.
- (3) Any combination of the categories referred to in paragraph (a) of this section.
- (b) The Secretary announces any priority described in paragraph (a) of this section in the application notice published in the Federal Register.

(Authority: 20 U.S.C. 1125a)

Subpart C—What Conditions Must Be Met by a Grantee?

§ 671.20 What costs are allowable?

Grant funds may be used for purposes necessary to carry out any of the activities described in § 671.3, including equipment and supplies, staff salaries, and travel.

(Authority: 20 U.S.C. 1125a)

§ 671.21 What are the limitations on allowable costs?

(a) Equipment costs exceeding 5 percent of the grant are not allowable.

(b) Grant funds may not be used to supplant funds that would be made available by recipients for the purposes of this part in the absence of the grant.

(Authority: 20 U.S.C. 1125a)

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[IL15-2-5533; FRL-4139-8]

Approval and Promulgation of Air Quality Implementation Plans; Illinois

AGENCY: United States Environmental Protection Agency (USEPA).
ACTION: Final Rule; removal.

SUMMARY: In a March 24, 1992, final rule (57 FR 10140), USEPA approved a sitespecific revision to the Illinois State Implementation Plan (SIP) for ozone without prior proposal. The rule applied to a facility in Richland County, Illinois operated by Roadmaster Corporation. Roadmaster's facility uses black and white flowcoaters to apply extreme performance coatings to miscellaneous metal parts and products. This SIP revision set a ceiling of 5.9 pounds of volatile organic matter (VOM) per gallon of paint, based on weekly averaging, for the existing black and white flowcoaters, and would have expired on January 1, 2000.

Today, USEPA is removing its rule, because notice was received from the Natural Resources Defense Council of intention to submit comments adverse to the rulemaking. In a subsequent Federal Register Notice USEPA will propose rulemaking on this requested revision to the Illinois SIP.

EFFECTIVE DATE: June 12, 1992.

ADDRESSESS: Copies of the documents relevant to this action are available for public inspection during normal business hours at the following location: U.S. Environmental Protection Agency, Region 5, Regulation Development Branch, 77 West Jackson Boulevard, Chicago, Illinois 60604.

Valdas Adamkus,

Regional Administrator.

For the reasons stated in the preamble, chapter I of title 40 of the Gode of Federal Regulations is amended as follows:

PART 52—APPROVAL AND PROMULGATION OF IMPLEMENTATION PLAN

Subpart O-Illinois

1. The authority citation for part 52 continues to read as follows:

Authority: 42 U.S.C. 7401-7642.

§ 52.720 [Amended]

 Section 52.720 is amended by removing paragraph (c)(83).

[FR Doc. 92-13894 Filed 6-11-92; 8:45 am]

40 CFR Part 180

[OPP-300248A; FRL-4067-3]

RIN 2070-AB78

N,N-Bis 2-(Omega-Hydroxypolyoxyethylene/ Polyoxypropylene) Ethyl Alkylamine; Tolerance Exemption

AGENCY: Environmental Protection Agency (EPA).

ACTION: Final rule.

SUMMARY: This document establishes an exemption from the requirement of a tolerance for residues of N,N-bis 2-(omega-hydroxypoloyxyethylene/polyoxypropylene) ethyl alkylamine when used as an inert ingredient (surfactant) in pesticide formulations applied to growing crops only. This regulation was requested by Akzo Chemicals, Inc.

EFFECTIVE DATE: This regulation becomes effective June 12, 1992.

ADDRESSES: Written objections, identified by the document control number, [OPP-300248A], may be submitted to: Hearing Clerk (A-110), Environmental Protection Agency, Rm. M3708, 401 M St., SW., Washington, DC 20460.

FOR FURTHER INFORMATION CONTACT: By mail: Connie Welch, Registration Support Branch, Registration Division, Environmental Protection Agency, 401 M St., SW., Washington, DC 20460. Office location and telephone number: rm. 711l,

CM #2, 1921 Jefferson Davis Highway, Arlington, VA 22202, (703)-305-7252.

SUPPLEMENTARY INFORMATION: In the Federal Register of April 15, 1992 (57 FR 13069), EPA issued a proposed rule that gave notice that Akzo Chemicals, Inc., 800 South Riverside Plaza, Chicago IL 60606, had requested that the Administrator, pursuant to section 408(e) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 346a(e)). propose to amend 40 CFR 180.1001(d) by establishing an exemption from the requirement of a tolerance for residues of N,N-bis 2-(omegahydroxypolyoxyethylene/ polyoxypropylene) ethyl alkylamine when used as an inert ingredient (surfactant) in pesticide formulations applied to growing crops only.

Inert ingredients are all ingredients that are not active ingredients as defined in 40 CFR 153.125 and include but are not limited to the following types of ingredients (exept when they have a pesticidal efficacy of their own): solvents such as alcohols and hydrocarbons; surfactants such as polyoxyethylene polymers and fatty acids; carriers such as clay and diatomaceous earth; thickeners such as carrageenan and modified cellulose: wetting, spreading, and dispersing agents; propellants in aerosol dispensers; microencapsulating agents; and emulsifiers. The term "inert" is not intended to imply nontoxicity; the ingredient may or may not be chemically active.

There were no comments or requests for referral to an advisory committee received in response to the proposed rule.

The data submitted in the petition and other relevant material have been evaluated and discussed in the proposed rule. Based on the data and information considered, the Agency concludes that the tolerance exemption will protect the public health. Therefore, the tolerance exemption is established as set forth below.

Any person adversely affected by this regulation may, within 30 days after publication of this document in the Federal Register, file written objections with the Hearing Clerk, at the address given above (40 CFR 178.20). The objections submitted must specify the provisions of the regulation deemed objectionable and the grounds for the objections (40 CFR 178.25). Each objection must be accompanied by the fee prescribed by 40 CFR 180.33(i). If a hearing is requested, the objections must include a statement of the factual issue(s) on which a hearing is requested. the requestor's contentions on such

issues, and a summary of any evidence relied upon by the objector (40 CFR 178.27). A request for a hearing will be granted if the Administrator determines that the material submitted shows the following: There is a genuine and substantial issue of fact; there is a reasonable possibility that available evidence identified by the requestor would, if established, resolve one or more of such issues in favor of the requestor, taking into account uncontested claims or facts to the contrary; and resolution of the factual issue(s) in the manner sought by the requestor would be adequate to justify the action requested (40 CFR 178.32).

The Office of Management and Budget has exempted this rule from the requirements of section 3 of Executive Order 12291.

Pursuant to the requirements of the Regulatory Flexibility Act (Pub. L. 96-354, 94 Stat. 1164, 5 U.S.C. 601-812), the Administrator has determined that regulations establishing new tolerances or raising tolerance levels or establishing exemptions from tolerance requirements do not have a significant economic impact on a substantial number of small entities. A certification statement to this effect was published in the Federal Register of May 4, 1961 (46 FR 24950).

List of Subjects in 40 CFR Part 180

Administrative practice and procedure, Agricultural commodities, Pesticides and pests, Reporting and recordkeeping requirements.

Dated: June 3, 1992.

Douglas D. Campt,

Director, Office of Pesticide Programs.

Therefore, 40 CFR part 180 is amended as follows:

PART 180-[AMENDED]

1. The authority citation for part 180 continues to read as follows:

Authority: 21 U.S.C. 346a and 371.

2. In § 180.1001, paragraph (d) is amended in the table therein by adding and alphabetically inserting the following inert ingredient, to read as follows:

§ 180.1001 Exemptions from the requirments of a tolerance.

(d) * * '

Limits	Uses	
tion	Surfactant.	
	Not more than 0.5% of pesticide formula-

40 CFR Parts 766 and 799 [OPPTS-40023; FRL 4045-9]

Technical Amendments to Test Rules and Consent Orders

AGENCY: Environmental Protection Agency (EPA). ACTION: Final rule.

summary: Pursuant to 40 CFR 790.55 and 790.68, EPA has approved by letter certain modifications to test standards and schedules for chemical testing programs under section 4 of the Toxic Substances Control Act (TSCA). These modifications, requested by test sponsors, will be incorporated and codified in the respective test regulation or consent order. Because these modifications do not significantly alter

the scope of a test or significantly change the schedule for its completion, EPA approved these requests without seeking notice and comment. EPA will annually publish a notice describing all of the modifications granted by letter for the previous year.

EFFECTIVE DATE: June 12, 1992.

FOR FURTHER INFORMATION CONTACT: Susan B. Hazen, Director, Environmental Assistance Division (TS-799), Office of

Assistance Division (TS-799), Office of Pollution Prevention and Toxics, Rm. E-543B, 401 M St., SW., Washington, DC 20460, (202) 554-1404, TDD (202) 554-0551.

issued an interim final rule published in the Federal Register of September 1, 1989 (54 FR 36311), amending procedures for modifying test standards and schedules for test rules and testing consent orders under section 4 of TSCA. The amended procedures allow EPA to approve requested modifications which do not alter the scope of a test or significantly change the schedule for its

completion. These modifications are approved by letter without public comment. The rule also requires immediate placement of these letters in EPA's public files and publication of these modifications in the Federal Register. This document includes modifications approved from January 1, 1991, through December 31, 1991. For a detailed description of the rationale for these modifications, refer to the submitters' letters and EPA's responses in the public record for this rulemaking.

I. Discussion of Modifications

Each chemical discussed in this rule is identified by a specific CAS number and docket number. Copies of correspondence relating to specific chemical modifications may be found in docket number (OPPTS-40023) or the chemical-specific docket established for this rule. The following table lists all chemical-specific modifications approved from January 1, 1991, through December 31, 1991:

MODIFICATIONS TO TEST STANDARDS AND CONSENT ORDERS JANUARY 1, 1991 THROUGH DECEMBER 31, 1991

Chemical/CAS Number	40 CFR Cite	Required Test	Modifica- tions	Docket No.
Final Rule Chemicals allyl ether of tetrabromobisphenol-A (25327–89–3)	766.35	Analytical testing	5	40023/83002L

MODIFICATIONS TO TEST STANDARDS AND CONSENT ORDERS JANUARY 1, 1991 THROUGH DECEMBER 31, 1991—Continued

Chemical/CAS Number	40 CFR Cite	Required Test	Modifica- tions	Docket No.
tetrabromobisphenol-A-bisethoxylate (4162-45-2)	766.35	Analytical testing	5,8	40023/830021
3,4',5-tribromosalicylanilide (87-10-5)	766.35	Analytical testing	8	40023/830021
tetrabromobisphenol-A (79-94-7)	766.35	Analytical testing	5	40023/830021
2,4,6-tribromophenol (118–79–6)	766.35	Analytical testing	5	40023/83002L
decabromodiphenyloxide (1163-19-5)	766.35	Analytical testing	5	40023/83002L
pentabromodiphenyloxide (32534-81-9)	766.35	Analytical testing	5	40023/83002L
octabromodiphenyloxide (32536-52-0)	766.35	Analytical testing	5	40023/83002L
1,2-bis(tri-bromophenoxy)ethane (37853-59-1)	766.35	Analytical testing		40023/83002L
2.3,5,6-tetrachloro-2,5-cyclohexadiene-1,4-dione (118-75-2)	766.35	Analytical testing	5	40023/83002L
1,2,4-trichlorobenzene (120–82–1)	799.1053	oncogenicity study	5	40023/47002J
fluoroalkenes, vinyl fluoride (75-02-5)	799.1700	oncogenicity test in rats	9	40023/42002M
commercial hexane (110-54-3), (96-37-7)	799.2155	pharmacokinetics	5	40023/42084K
tributyl phosphate (126-73-8)	799.4360	daphnid chronic toxicity test, fish early-life stage test, oral/ dermal pharmacokinetics test.	5	40023/421000
unsubstituted phenylenediamines (95-54-5 and 106- 50-3) Consent Orders	799.3300	chronic Daphnia testing with o-pda and p-pda	5	40023/42008
C.I. disperse blue 79:1 (3618-72-2)	799.5000	rainbow trout early life cycle test	5	40023/42103C
crotonaldehyde (4170–30–3)	799.5000	fish early life stage testing (fathead minnow), daphnid chronic toxicity testing.	5	40023/42108A
disodecyl phenyl phosphile (25550-98-5)	799.5000	substances, neurotoxic esterase assay.	5	40023/42101C
4-nonylphenol, branched (84852-15-3)	799.5000	fathead minnow test, tadpole bioassay, midge bioassay	5	40023/42104D
octamethylcyclotetrasiloxane (556-67-2)	799.5000	bioconcentration test, blodegradation test, bloaccumulation test, sediment/invertebrate studies.	5,8	40023/42071D
1,1,1-trichloroethane (71–55–6)	799.5000	dose levels and dose selection, delayed matching-to-position test, breeding, duration of dosing.	7	40023/42058F
triethylene glycol monomethyl ether (112-35-6)	799.5000	Analytical testing	8	40023/42080H

MODIFICATIONS

- 1. Modify sampling schedule.
- 2. Change to test substance (form/purity).
- 3. Change in non-critical test procedure or
- 4. Add satellite group for further testing.
- Extend test or protocol deadline, delete test initiation date.
- Clarify and/or add specific guideline requirement.
- 7. Alternate specific guideline requirement approved for certain test(s).
- 8. CAS No. correction.
- 9. Test standard amendment

II. Public Record

EPA has established a public record for this rulemaking (docket number OPPTS-40023). The record includes the information considered by EPA in evaluating the requested modifications.

The record is available for inspection from 8 a.m. to 12 noon and 1 p.m. to 4 p.m., Monday through Friday, except legal holidays, in rm. G-004, NE Mall, 401 M St., SW., Washington, DC 20460.

III. Other Regulatory Requirements

A. Executive Order 12291

Under Executive Order 12291, EPA must judge whether a rule is "major" and therefore subject to the requirement of a Regulatory Impact Analysis. This rule, listing modifications of test standards and schedules for tests required under test rules and testing consent agreements under the authority of section 4 of TSCA, is not major because it does not meet any of the criteria set forth in section 1(b) of the Order.

This rule was submitted to the Office of Management and Budget (OMB) for review as required by Executive Order 12291. Any written comments from OMB to EPA, and any EPA response to those comments, are included in the rulemaking record.

B. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, (5 U.S.C. 601 et seq.), EPA is certifying that this rule will not have a significant impact on a substantial number of small businesses because the modifications listed in this rule have been made to expedite the development of test data and to reduce certain paperwork burdens associated with current regulations.

C. Paperwork Reduction Act

The information collection requirements associated with this rule have been approved by OMB under the provisions of the Paperwork Reduction Act, 44 U.S.C. 350l et. seq. and have been assigned OMB control number 2070–0033.

EPA has determined that this rule does not change existing recordkeeping or reporting requirements nor does it impose any additional recordkeeping or reporting requirements on the public.

Send comments regarding this rule including suggestions for reducing this burden to Chief, Information Policy Branch, PM-223, U.S. Environmental Protection Agency, 401 M St., SW., Washington, DC 20460; and to the Office of Management and Budget, Paperwork Reduction Project (2070-0033) Washington, DC 20503.

List of Subjects In 40 CFR Parts 766 and 799

Chemicals, Chemical export, Environmental protection, Hazardous substances, Recordkeeping and reporting requirements, Testing. Dated: May 29, 1992.

Mark A. Greenwood,

Director, Office of Pollution Prevention and Toxics.

Therefore, 40 CFR parts 766 and 799 are amended as follows:

1. In part 766:

PART 766-[AMENDED]

a. The authority citation for part 766 continues to read as follows:

Authority: 15 U.S.C. 2603 and 2607.

b. In § 766.35, by revising paragraphs and (a)(2)(ii)(A), (b)(4)(i) and (f) to read as follows:

§ 766.35 Dibenzo-para-dioxins/dibenzofurans.

chemical substances.

(A) Except as noted for the submitter and substance specified in the following table, protocols for testing must be submitted 24 months after manufacture

or importation begins for chlorinated

CAS No.	Submitter	Chemical	Due Date	Paris S

(2) * * *

(ii) All rats of test groups in which survival is approximately 25 percent of rats at risk (approximately 25 percent of 60, or approximately 15 rats) will be sacrificed near the time that 25 percent survival is achieved. All rats surviving the 24-month test period will be sacrificed and necropsied. The order of sacrifice for rats at all pathological evaluations will be random among all exposure groups within a sex. Moribund animals should be removed and sacrificed when noticed.

(C) [Reserved]

.

(d) Effective date. (1) The effective date of the final rule is July 22, 1987, except for paragraphs (c)(1)(i)(C)(1). (c)(1)(ii)(A), and (c)(4)(i) of this section.

- (2) The effective date of paragraphs (c)(1)(i)(C)(1) and (c)(1)(ii)(A) is May 21, 1990. The effective date for paragraphs (c)(4)(i)(A)(1), (c)(4)(i)(A)(2)(i), (c)(4)(i)(B), and (c)(4)(i)(D) is May 21, 1991. The effective date of paragraphs (c)(4)(i)(A)(2)(ii) and (c)(4)(i)(C) is June
- (3) The guidelines and other test methods cited in this rule are referenced as they exist on the effective date of the final rule.
- d. In § 799.2155 by revising paragraphs (c)(8)(i), (c)(8)(ii)(A) and (d) read as follows:

§ 799.2155 Commercial hexane.

(c) *

(8) * * *

(i) Required testing. (A) Pharmacokinetics testing shall be conducted in rats in accordance with § 795.232 of this chapter, except for paragraph (c)(1)(ii) of § 795.232.

(B) For the purposes of this section, the following provisions also apply:

- (1) Test animals. Adult male and female rats shall be used for testing. The rats shall be 9 to 11 weeks old and their weight range should be comparable from group to group. The animals shall be purchased from a reputable dealer and shall be permanently identified upon arrival. The animals shall be selected at random for the testing groups, and any animal showing signs of ill health shall not be used.
- (2) Species and strain. The rat strain used shall be the same as the strain used in the subchronic and chronic tests required under § 798.2450(d)(1)(i) and § 798.3300(b)(1)(i).

(ii) Reporting requirements. (A) The inhalation and dermal pharmacokinetics tests shall be completed and the final report submitted to EPA by August 21,

1992.

- (d) Effective date. (1) The effective date of this final rule is November 17, 1988, except for the provisions of paragraphs (c)(5)(i)(D), (c)(5)(ii)(A)(4), (c)(5)(ii)(C), (c)(8)(i) and (c)(8)(ii)(A) of this section. The effective date for paragraphs (c)(5)(i)(D), (c)(5)(ii)(A)(4) and (c)(5)(ii)(C) of this section is May 21, 1990. The effective date for paragraphs (c)(8)(i) and (c)(8)(ii)(A) of this section is June 12, 1992.
- (2) The guidelines and other test methods cited in this section are referenced as they exist on the effective date of the final rule.
- e. In § 799.3300 by revising paragraphs (e)(2)(ii)(A) and (f) to read as

§ 799.3300 Unsubstituted Phenylenediamines.

(e) * (2) . . .

- (ii) Reporting requirements. (A) The fish partial life-cycle flow-through test shall be completed and final results shall be submitted to EPA no later than December 1, 1992.
- (f) Effective dates. (1) The effective date of this final rule is January 16, 1990, except for paragraphs (c)(1)(i)(B), (c)(1)(ii)(A), (c)(1)(ii)(C), (c)(1)(ii)(F), (c)(3)(ii)(A), (e)(1)(ii), (e)(2)(ii)(A) and (e)(2)(ii)(B) of this section. The effective date for paragraphs (c)(1)(i)(B). (c)(1)(ii)(C) and (c)(1)(ii)(F) of this section is May 21, 1990. The effective date for paragraphs (c)(1)(ii)(A), (c)(3)(ii)(A), (e)(1)(ii) and (e)(2)(ii)(B) of this section is May 21, 1991. The effective date for paragraph (e)(2)(ii)(A) of this section is June 12, 1992.
- (2) The guidelines and other test methods cited in this rule are referenced as they exist on the effective date of the final rule.

f. In § 799.4360 by revising paragraphs (c)(8)(ii), (d)(5)(ii)(A), (d)(6)(ii)(A) and (f) to read as follows:

§ 799.4360 Tributyl phosphate.

(c) * (8) *

(ii) Reporting requirements. (A) The pharmacokinetics test required in paragraph (c)(8)(i) of this section shall be completed and the final report submitted to EPA by June 27, 1992.

(B) Interim 6 month progress reports shall be submitted to EPA beginning at 6 months after the effective date of the final rule and continuing until submission of the final report.

(d) * (5)

(ii) Reporting requirements. (A) The daphnid chronic toxicity test, if required, shall be completed and the final report submitted to EPA by September 27, 1991. .

(6) * * *

(ii) Reporting requirements. (A) The fish early-life stage flow-through toxicity test shall be completed and the final report submitted to EPA by December 27, 1991. . . .

(f) Effective date. (1) The effective date of this final rule is September 27, 1989, except for paragraphs (c)(2)(ii)(A), (c)(3)(ii)(A), (c)(8)(i), (c)(8)(ii)(A), (d)(5)(ii)(A), (d)(6)(ii)(A), (e)(1)(ii), (e)(2)(ii)(A), and (e)(3)(ii) of this section.

The effective date for paragraphs (c)(2)(ii)(A), (c)(3)(ii)(A), (c)(8)(i), (e)(1)(ii), (e)(2)(ii)(A) and (e)(3)(ii) of this section is May 21, 1991. The effective date for paragraphs (c)(8)(ii)(A), (d)(5)(ii)(A) and (d)(6)(ii)(A) of this section is June 12, 1992.

(2) The guidelines and other test methods cited in this rule are referenced as they exist on the effective date of the

final rule.

§ 799.5000 [Amended]

g. In the table to § 799.5000, change the CAS No. "556-57-2" to read "556-

Medicare Program; Payment for **Federally Qualified Health Center** Services

AGENCY: Health Care Financing Administration (HCFA), HHS. ACTION: Final rule with comment period.

SUMMARY: These regulations establish a new category of facility known as a Federally qualified health center (FQHC), the services of which are covered under the Medicare program. This new type of entity is one that is receiving a grant under section 329, 330, or 340 of the Public Health Service (PHS) Act, a non-grant receiving entity that is determined by the Secretary to meet the PHS Act requirements for receiving such a grant, and certain facilities that have previously been identified as Federally funded health centers. These regulations also establish requirements for coverage and payment of FQHC services under the Medicare program. Related Medicaid rules are being developed in a separate rulemaking document.

These regulations implement section 4161 of the Omnibus Budget Reconciliation Act of 1990 (OBRA Omnibus Budget Reconciliation Act of 1990 (OBRA '90), Public Law 101-508.

DATES: These regulations are effective June 12, 1992. Written comments will be considered if we receive them at the

appropriate address, as provided below. no later than 5 p.m. on August 11, 1992.

ADDRESSES: Mail comments to the following address:

Health Care Financing Administration, Department of Health and Human Services, Attention: BPD-728-FC, P.O. Box 26676, Baltimore, Maryland 21207.

If you prefer, you may deliver your written comments to one of the following addresses:

Room 309–G, Hubert H. Humphrey Building, 200 Independence Avenue, SW., Washington DC, 20201, or Room 132, East High Rise Building, 6325 Security Boulevard, Baltimore, Maryland 21207.

If you wish to submit comments on the information collection requirements contained in this final rule, you may submit comments to:

Allison Herron-Eydt, HCFA Desk Officer, Office of Information and Regulatory Affairs, Room 3002, New Executive Office Building, Washington, DC 20503.

Due to staffing and resource limitations, we cannot accept comments by facsimile (FAX) transmission.

In commenting, please refer to file code BPD-728-FC. Written comments received timely will be available for public inspection as they are received, beginning approximately three weeks after publication of this document, in room 309-G of the Department's offices at 200 Independence Avenue, SW., Washington, DC, on Monday through Friday of each week from 8:30 a.m. to 5 p.m. (phone: 202-245-7890).

SUPPLEMENTARY INFORMATION:

Background

General

Prior to the enactment of OBRA '90 Medicare paid for comprehensive health services in medically-underserved, low-income areas furnished by Federally Funded Health Centers (FFHCs). These were, for example, community health centers and migrant health centers that received unrestricted funds for operations directly in the form of a grant from Federal sources such as the Public Health Service (PHS).

FFHCs were eligible for payment for the scope of services normally covered under Medicare Part B. FFHCs were reimbursed by the Medicare program (Title XVIII of the Social Security Act (the Act)) for covered medical and other health services furnished to Medicare beneficiaries on a reasonable charge basis through Medicare carriers, or on a charge related to reasonable cost basis reimbursed through an intermediary. In general, the payment rate was an allinclusive rate determined by dividing the center's allowable and covered costs by covered physician visits furnished during the cost reporting period, subject to certain screening guidelines and a payment limit. An FFHC's all-inclusive rate was compared to the statewide payment limit, and the FFHC rate was set at the lesser of the all-inclusive rate or the statewide payment limit. This rate was paid to the center (on a per-bill basis subject to the Medicare Part B deductible and coinsurance) each time a Medicare beneficiary had a face-to-face encounter with a physician furnishing a covered service.

Recent Statutory Changes

Section 4161(a) OBRA '90 amends section 1861(aa) of the Act, establishing a new Medicare benefit, outpatient services furnished by provider-based and independent Federally qualified health centers (FQHCs). Section 4161(a)(2)(C) of OBRA '90 defines an FQHC as an entity that is receiving a grant under section 329, 330, or 340 of the Public Health Service Act; or is receiving funding from such a grant under a contract with the recipient of such a grant and meets the requirements to receive a grant under section 329, 330, or 340 of the Public Health Service Act; or based on the recommendation of the Health Resources and Services Administration within the Public Health Service, is determined by the Secretary to meet the requirements for receiving such a grant; or was treated by the Secretary, for purposes of Medicare Part B, as an FFHC as of January 1, 1990. For example, FFHCs are grandfathered in as FOHCs under the statute and do not have to meet the standards in 42 CFR part 491 prior to signing a Medicare participation agreement.

Section 4161(a)(2) of OBRA '90 defines FOHC services as the services described in section 1861(aa)(1)(A) through (C) of the Act, which, generally, are rural health clinic (RHC) services provided by physicians, physician assistants, nurse practitioners, qualified clinical psychologists, clinical social workers. and certain visiting nurse services. Section 4161(a)(2) of OBRA '90 also adds to the definition of FQHC services a new service that only an FQHC may be paid for under Medicare: preventive primary health services that a center is required to provide under sections 329. 330, and 340 of the Public Health Service Act. Section 4161(a)(3)(B) of OBRA '90

amends section 1833(b) of the Act and provides that the Part B deductible does not apply to FQHC services.

Section 4161(a)(3)(C)(i) of OBRA '90 amends section 1862(a)(2) of the Act. Section 1862(a)(2) provides that no payment is made under Medicare Parts A or B for any expenses incurred for items or services furnished to an individual for which the individual has no legal obligation to pay. The OBRA '90 provision provides an exception to this requirement in the case of FQHCs. Section 4161(a)(3)(C)(ii) provides a similar exception to section 1862(a)(3) of the Act. That section prohibits Medicare payment for services which are paid for directly or indirectly by a governmental entity. OBRA '90 provides for payment to FQHCs for beneficiaries who receive services that are paid for directly or indirectly by a governmental entity. Section 4161(a)(3)(C)(iii) further amends section 1862(a)(7) of the Act. Section 1862(a)(7) of the Act describes certain medical expenses not generally covered under Medicare, such as routine physical checkups, eye examinations, and hearing aids. Section 4161(a)(3)(C)(iii) of OBRA '90 specifies that section 1862(a)(7) does not apply to FQHC services described in section 1861(aa)(3)(B) of the Act (the preventive primary health services added to Medicare as an FQHC benefit).

Section 1128B(b) (1) and (2) of the Act provides that individuals who solicit, receive, offer or pay any remuneration (including any kickbacks, bribes or rebates) to induce referrals, purchasing. leasing, ordering, etc., under Medicare or any State health care program are guilty of a felony and, if convicted, are subject to fines or prison terms. Exceptions are provided in certain circumstances. One of the exceptions was added by section 4161(a)(4) of OBRA '90, which adds to the list of situations to which an exception applies the waiver of coinsurance under Medicare Part B for services furnished an individual by an FQHC. The implementation of this provision is the responsibility of the Office of the Inspector General, and implementing regulations are found at 42 CFR 1001.952(k)(2), published at 56 FR 35987 on July 29, 1991.

The statutory provisions are effective on October 1, 1991.

Provisions of the Regulation

In 42 CFR part 405 subpart X, we have established new §§ 405.2430 through 405.2452 to specify the scope of services to be furnished by Federally qualified health care centers and basic qualification requirements associated with the benefit. We redesignate existing §§ 405.2418 through 405.2430 as §§ 405.2460 through 405.2472, respectively, to specify the payment provisions for RHCs and Federally qualified health centers. In addition, in § 405.2410, we revise the definition of a visit and add a definition of FQHC. We are also revising certain provisions in part 410 which pertain to RHCs to include FQHCs and clarify that other pertinent regulations are applicable to FQHCs.

A. Qualification Requirements

In § 405.2401, Scope and Definitions, we define an FQHC. The definition is applicable to provider-based FOHCs as well as independent FQHCs. The entity must be receiving a grant under section 329, 330 or 340 of the PHS Act, or be receiving funding from such a grant under a contract with the recipient of such a grant and meet the requirements to receive a grant under section 329, 330 or 340 of the PHS Act. Alternatively, the entity may be determined by the Secretary to meet the requirements for receiving such a grant, based on the recommendation of the Health Resources and Services Administration (HRSA) within the PHS. We refer to such an entity generally as a "lookalike," for although it does not receive any PHS grant monies, HRSA will have reviewed the entity's application and recommended that it qualify for FQHC status because it meets all grant requirements under one of the pertinent sections of the PHS Act. HRSA will base its review and recommendations for look-alike status using the requirements of the PHS Act, as set forth in 42 CFR parts 51c and 56.

FQHC look-alikes must meet the same standards as grantees under section 329, 330, or 340 of the PHS Act. To demonstrate compliance with program requirements, applicants for Medicare look-alike status must provide the same information requested of grantees in the same format except that FQHC lookalikes are not required to provide: (1) A rationale for Federal funding, (2) a proposal for use of Federal grant funds, (3) data for a special clinical study being conducted, or (4) maximization of non-Federal revenues. The Medicaid statute (Title XIX of the Act) also provides for look-alike qualification, but it permits temporary waiver of certain provisions of the PHS Act in granting FQHC qualification. The Medicare statute does not contain a provision for waiver. This means that Medicaid FOHCs that are approved on the basis of a temporary waiver may not qualify as Medicare FQHCs.

Entities should apply for FOHC qualification through HRSA Regional Offices. HRSA will notify HCFA of entities that it recommends for qualification as FQHCs because they meet the PHS requirements, either as grant recipients or as look-alikes. Additionally, HRSA is responsible for all activities related to monitoring grantees to assure that they continue to meet the statutory FOHC qualifications (i.e., they continue to meet the conditions in the PHS Act). HRSA will notify HCFA of grantees which no longer meet the FQHC qualification criteria.

Another alternative by which an entity may qualify as an FQHC is to have been treated by the Secretary, for purposes of Part B, as a comprehensive Federally funded health center as of January 1, 1990. Since HCFA knows that these entities meet the qualification requirements, application to HRSA will not be necessary. HCFA Regional Offices will secure appropriate execution of an agreement as discussed below.

FQHCs may participate in the Medicare program and receive payment for FQHC services, including preventive primary services, regardless of whether they are free-standing or provider-based entities. The qualification requirements for FQHCs are the same for free-standing or provider-based entities. However, the payment methodologies for these two types of FQHCs differ, as discussed later in this preamble and as set forth in § 405.2462.

Basic Requirements

For any entity that meets the above qualification requirements to be paid for FQHC services, it must enter into a signed agreement with HCFA to meet Medicare program requirements under 42 CFR 405.2432 and 405.2434. HCFA will enter into an agreement with the entities when: (1) Based on the recommendation of PHS, we determine that the entity meets the FQHC qualification requirements; (2) the entity assures HCFA that is meets the applicable requirements of part 405. subpart X and part 491, as described in § 405.2434(a); and (3) any other agreement between HCFA and the entity under Medicare is terminated. PHS regulations regarding staffing requirements, for example, 42 CFR 51c.303(a), require that a clinic's professional staff be adequate to provide the clinic's health services to residents of the catchment area. Under PHS requirements, a clinic has flexibility in the makeup of its staff. Therefore, the staff of a PHS-approved clinic that seeks Medicare FQHC participation may vary

in the proportions of physicians and other health care personnel providing services. Accordingly, we are modifying § 491.8 (a)(1) and (6) to provide that an FQHC is not required to include in its health care staff specific numbers of physician's assistants or nurse practitioners and is not required to maintain the availability of physician assistants and nurse practitioners to furnish patient care services at least 60 percent of the time the clinic operates. Section 491.8(a), paragraphs (1) and (6) continue to apply, without modification, to Medicare approved RHCs.

Although the law does not explicitly require an agreement between the FQHC and HCFA, we believe that Congress intended that HCFA's relationship with FQHCs would parallel that with RHCs. Further, we have required participation agreements with other non-provider entities, such as ambulatory surgery centers and End Stage Renal Disease facilities, to assure protection for Medicare beneficiaries. Thus, we have developed participation agreements for FQHCs that are similar to those of the RHCs. In general, the Medicare basic requirements for RHCs will apply to FQHCs and will help assure that they are generally held to standards in 42 CFR part 405, subpart X and part 491 that apply to RHCs.

However, we request public comment on the impact that these standards would have on FQHCs. We are aware that, for example, FFHCs that are grandfathered in as FQHCs may not have been subject to health and safety requirements.

Within 42 CFR part 491, there are two issues that we particularly call to the reader's attention. First, we do not believe that it is necessary to mandate a list of medical tests that FQHCs must perform; therefore, we are exempting FQHCs from the requirements that apply to RHCs in § 491.8(c)(2). FQHCs that choose to perform clinical laboratory tests are subject to the applicable provisions of the Clinical Laboratory Improvement Amendments of 1988 since that law is applicable by its own terms. Section 491.8(c)(2) continues to apply to RHCs. Second, § 491.11 of this regulation requires RHCs and FQHCs to do annual evaluations of their programs. We believe this is a reasonable requirement in order to evaluate utilization of services, compliance with established policies, and to determine if changes are needed. We invite public comment. however, on the appropriateness of this Medicare requirement for FQHCs.

In summary, our purpose in establishing requirements for FQHCs is to establish standards for enforcement purposes. HCFA will not survey FQHCs prior to approving agreements for FQHC participation. However, HCFA is responsible for resolving complaints about FQHCs and for determining whether an FQHC continues to meet applicable standards after it signs the participation agreement. We believe, as does the PHS, that the standards we have established will not impose an additional burden on the entities in question.

However, since the PHS already closely monitors and conducts periodic onsite reviews of grantees, we have not incorporated the certification procedure applicable to RHCs into the FQHC requirements. HCFA will not routinely conduct surveys of FQHCs. However, entities that qualify for FQHC status must assure HCFA that they meet and will continue to meet the applicable regulatory standards. These requirements involve standards for practitioners; compliance with Federal, State, and local law; health and safety: standards; organizational roles, including disclosure of ownership; staff responsibilities; provision of services; maintenance of health records, including confidentiality; and program evaluation carried out by the center itself.

Section 4161(a)(2) of OBRA '90 also specifies that the requirements for RHCs that are not physician directed apply to FQHCs as well. These rules concern periodic physician review of services provided by physician assistants and nurse practitioners, medical orders, referrals, and consultation, all of which are subject to State and local law relative to the practice, performance, and delivery of health services.

An FQHC must notify HCFA immediately if it no longer meets the standards. Further, HCFA will investigate complaints regarding staffing or health and safety violations to assure that entities are complying with the requirements. Failure to meet these requirements may result in criminal penalties for submission of false assurances, as well as termination of the participation agreement.

Rural health clinics that are certified for Medicare participation will be required to satisfy the requirements of sections 329, 330, and 340 of the Public Health Service Act in order to qualify as Medicare FQHCs. This means that, for example, a rural health clinic that operates on a for-profit basis will not qualify as a Medicare FQHC.

Because some facilities now functioning as another kind of entity under Medicare will become FQHCs, it is essential for proper program oversight and payment that FQHCs be clearly identified prior to the beginning of their

coverage under Medicare as FQHCs and at the conclusion of the coverage as FQHCs. For example, we are aware that a number of RHCs currently providing services under Medicare are also recipients of PHS section 329, 330, or 340 grants and thereby will qualify for status as FQHCs. Since we do not believe it is appropriate for an entity to operate as both an RHC and FQHC simultaneously, these entities may cease to be RHCs and become FQHCs.

Further, we will terminate the charge-related-to-reasonable-cost-based payment methodology for FFHCs following publication of this regulation. Thus, all current charge related to reasonable cost-based FFHCs must sign an FQHC participation agreement or begin billing the Part B carrier for services under the usual Part B payment methods. Payment to FFHCs under § 410.152(j) and (b)(6) is no longer

applicable. The agreement, among other provisions, will assure that the FQHC is paid only as an FQHC for services covered under the FQHC benefit. If an entity that is not provider-based has other agreements under Medicare, they must be terminated before the FQHC agreement is effective. Consequently, we are requiring that entities that are not provider-based terminate other Medicare agreements as a basic requirement for FOHC status. Practitioners, such as physician employees of the FQHC, may continue to maintain any identification necessary for direct billing of Medicare for non-FQHC services. Thus, such physicians may continue to follow patients and provide non-FQHC services, such as services furnished to inpatients, and preserve continuity of care.

HCFA will notify entities that meet the qualification requirements of their eligibility for FQHC status and forward the entity two copies of the agreement. The entity must sign and return both copies of the agreement to HCFA. If HCFA accepts the agreement filed by the FQHC, HCFA will return to the center one copy of the agreement with the notice of acceptance specifying the effective date.

An entity is entitled to a hearing in accordance with 42 CFR part 498 if HCFA fails to enter or renew an agreement with an entity for FQHC services.

Since Congress provided for payment for FQHC services beginning October 1, 1991 to FQHCs that satisfy the requirements of the law on that date, we find that, once these rules are published, to further delay the effective date would serve no useful purpose. Medicare will pay for FQHC services furnished on or

after that date by entities that met the criteria in this regulation on that date and file a signed agreement within 60 days of the date of publication. For other entities, the effective date of the agreement is the date that the agreement is signed and all Federal requirements are met. Payment begins with the effective date of the agreement.

Content and Terms of Agreement

New § 405.2434 describes the content and terms of the agreement. Under the terms of the agreement, the FQHC agrees generally to maintain compliance with the terms of the agreement and not charge the beneficiary (or any other person acting on behalf of the beneficiary) for any FQHC services for which the beneficiary is entitled to have payment made on his or her behalf by the Medicare program.

The FQHC may, however, charge the beneficiary for items and services that are not FQHC services and may collect coinsurance amounts. If the items or services are covered under Part B of Medicare, and the FOHC agrees to receive reasonable charge payment under the assignment method, the FQHC may not charge the beneficiary more than 20 percent of the reasonable and customary charge. However, under Medicare, no coinsurance is due for a second or third opinion obtained in accordance with section 1164C of the Act or for pneumococcal vaccine and its administration. FQHCs may also charge beneficiaries any amounts for services not covered by Medicare for which the beneficiary is liable.

The FOHC also must agree to refund as promptly as possible any money incorrectly collected from Medicare beneficiaries or from someone on their behalf. The term "incorrectly collected" means any amount for covered services that is greater than the amount for which the beneficiary was liable because of the coinsurance requirements. Amounts also are considered incorrectly collected if the FOHC believed the beneficiary was not entitled to Medicare benefits but he or she was later determined to have been entitled, the beneficiary's entitlement period fell within the time the FQHC's agreement with HCFA was in effect, and the amounts exceed the beneficiary's coinsurance liability.

In the agreement, the FQHC also must agree to accept Medicare beneficiaries for care and treatment and not impose any limitations on care and treatment of Medicare beneficiaries that it does not also impose on all other individuals receiving care and treatment from the FQHC. If the FQHC does not furnish

treatment for certain illnesses and conditions to patients who are not Medicare beneficiaries, it is not required to furnish such treatment to Medicare beneficiaries. However, the FQHC may not refuse to furnish treatment for certain illnesses or conditions to Medicare beneficiaries if it furnishes such treatment to others.

Termination of Agreement

In new § 405.2436, we specify termination procedures for the agreement, notice provisions, and appeal procedures. We provide that the agreement is assigned to the new owner when an FQHC undergoes a change of ownership if the new owner meets the FQHC qualification requirements. We define a change of ownership as:

The incorporation of an unincorporated FQHC;

• The merger of the center corporation into another corporation, or the consolidation of two or more corporations, one of which is the center corporation, resulting in the creation of a new corporation (The merger of another corporation into the center corporation does not constitute change of ownership.); or

 The lease of all or part of an entity (constitutes change of ownership of the

leased portion).

Effect of Termination

In § 405.2436(d), we provide that no payment will be made to an FQHC for services it furnishes to Medicare beneficiaries on or after the effective date of termination, whether the termination is initiated by the FQHC or by HCFA.

Notice to the Public

We provide in new § 405.2442 that when an FQHC voluntarily terminates the agreement and we have approved or set an effective date for the termination, the FQHC must notify the public through publication in at least one newspaper in general circulation in the area serviced by the FQHC. The notice must contain the effective date and the effect of termination of the agreement. When we terminate the agreement, we will notify the public in a similar fashion.

Appeals

An FQHC may appeal HCFA's decision to terminate the agreement by using the procedures specified in part 498 (§ 405.2436).

Conditions for Reinstatement After Termination by HCFA

Once we have terminated an agreement with an FQHC, we will not enter into another agreement with that

entity until we find that the reason for the termination no longer exists, and we are assured that the reason for the termination of the prior agreement will not recur (new § 405.2440).

B. Scope of Services

New § 405.2446 provides that FQHC services that are payable by Medicare are the type of outpatient services furnished by RHCs plus certain preventive services. Services furnished by RHCs consist of services of physicians, physician assistants, nurse practitioners, nurse midwives, visiting nurses under certain conditions, clinical psychologists, and clinical social workers. Clinical psychologist services were added to the RHC benefit by section 4077(a) of the Omnibus Reconciliation Act of 1987, Public Law 100-203 (OBRA '87). Clinical social worker services were added to the RHC benefit by section 6213(b) of OBRA '89, Public Law 101-239. Since the RHC regulations have not previously been modified to incorporate these services, we define the terms clinical psychologist and clinical social worker in § 405.2450, as discussed later in this preamble.

In § 405.2445, we require that FQHC services be covered only in outpatient settings, including the patient's place of residence (which may be a skilled nursing facility or nursing facility), in accordance with section 1861(aa)(3)(B) of the Act, which restricts the provision of FQHC services to services furnished to outpatients of the FOHC. FOHC services would not be covered when furnished to inpatients of hospitals or rural primary care hospitals because of the provisions of section 1862(a)(14) of the Act, which prohibits payment for most services provided to hospital patients unless they are provided directly by the hospital or under arrangements in accordance with section 1861(w) of the Act. Although Medicare does not cover FQHC services for Medicare hospital inpatients. services of individual practitioners who may be employed in FQHCs, including qualified clinical psychologists, clinical social workers, nurse practitioners, nurse midwives, and physicians, may be covered under Medicare Part B and would be billable separately (in other words, not as FQHC services) under Part B.

Preventive Primary Services

Section 1861(aa)(3)(B) of the Act defines FQHC preventive care services as "* * preventive primary health services that a center is required to provide under sections 329, 330, and 340 of the PHS Act." The regulations at 42 CFR part 56 and 42 CFR part 51c, which

implement these provisions of the PHS Act, define primary preventive services as "including medical social services. nutritional assessment and referral. preventive health education, children's eye and ear examinations, prenatal and post-partum care, prenatal services, well child care (including periodic screening). immunizations, and voluntary family planning services." The Guide to Clinical Preventive Services, prepared under the supervision of the U.S. Preventive Services Task Force, for presentation to the U.S. Department of Health and Human Services, provides recommendations for clinical practice on 169 preventive interventions.

The Public Health Service believes that the preventive primary services in the U.S. Preventive Services Task Force Report for people over age 65 are preventive primary services consistent with the services its grantees are already required to provide and will be issuing clarifying guidelines to its

grantees to this effect.

Ordinarily, items and services such as routine physical checkups, eyeglasses, and hearing aids are excluded from Medicare coverage under section 1862 of the Act. However, section 4161 of OBRA '90 amended section 1862 of the Act to specify that this exclusion does not apply to these items and services furnished under FQHC benefit. However, the FQHC benefit covers only services of a physician or other health care professional and services that are incident to these services. Thus, it would not include eyeglasses and hearing aids. Despite the fact that there is an exception to the general exclusion for certain items and services included under the F QHC benefit, we do not believe that payment may be made for eyeglasses and hearing aids provided by an FOHC, because they are not preventive primary health care services under the PHS law. Thus, while a health care professional in an FQHC may counsel an individual about the need to obtain eyeglasses or a hearing aid, the purchase of the items would not be considered part of the service provided and would not be covered by Medicare.

The PHS Act provides for provision of other services that some individuals and/or centers may believe should be included as FQHC preventive services. For example, the PHS Act provides for preventive dental services as a primary health care benefit separate from primary preventive health services. Further, the PHS Act provides for supplemental health services as a benefit separate from preventive primary health care. Supplemental health services specifically delineated in

the PHS Act include vision services (other than vision screening), public health services (including nutrition education), health education services, and outreach services.

While we recognize that these may be helpful and necessary services, especially to those living in medically underserved areas, we do not believe that the Medicare statute may be read as extending Medicare coverage to such services, as discussed in more detail below. The Medicare law specifically refers only to primary preventive health care services in defining the scope of FQHC preventive services.

Consequently, the regulations specifically exclude mass information programs, health education classes and

dental services from the definition of FOHC preventive services.

In our regulation, we are listing a group of preventive services that are generally covered as FQHC services when provided to a beneficiary. We also are excluding from FQHC services preventive services that are covered separately under special provisions of Medicare, such as screening mammography services. The Medicare law provides coverage of screening mammography services under Medicare under explicit requirements including the same of payment for services, and, further, requires that an entity that provides screening mammography be certified for such services. (The requirements for Medicare coverage of screening mammography were published as an interim final rule with comment period on December 31, 1990 at 55 FR 53510.) Although we recognize that screening mammography is a preventive service, payment and coverage for it are governed by the specific provisions for applying that benefit. Therefore, we will not pay for screening mammography as an FQHC preventive service. If the FOHC meets the applicable certification and coverage rules, we will pay for mammography under the regular Part B benefit provisions applicable to that service.

Screening pap smear services are also covered under regular Medicare Part B benefit provisions. We will pay for screening pap smear services as FQHC preventive services if provided by center employees. As with other services, the requirements of the Clinical Laboratory Improvement Amendments of 1988 apply to these services.

Preventive dental services are noncovered services under Medicare. Section 1862(a)(12) of the Act prohibits payment for "services in connection with the care, treatment, filling, removal or replacement of teeth or structures directly supporting * * *" There are other exclusions from coverage in section 1862(a) of the Act that Congress chose to render inapplicable to the FQHC benefit when it defined that benefit. Section 4161(a)(3)(C) of OBRA '90 amended section 1862(a) of the Act by declaring that section 1862(a)(7) does not apply to FQHC preventive services (in section 1861(aa)(3)(B)). This means, for example, that certain previously uncovered services or certain immunizations could be paid for under this new benefit. Therefore, we conclude that Congress considered the exclusions in section 1862(a) of the Act and decided not to include preventive dental services or any preventive services not covered by the applicable provisions of the PHS Act as part of this new Medicare benefit.

We are defining covered preventive primary services as services that must be furnished by center staff or meet the definition of physician services in § 405.2412. Preventive primary services are those services an entity is required to provide as primary preventive services under the PHS Act. Preventive services include children's eye and ear examinations to determine the need for vision or hearing correction, prenatal services, well child services and family planning services. Preventive services also include those services included in the U.S. Preventive Services Task Force Report for persons age 65 and older.

Clinical Psychologists and Clinical Social Workers

We are providing that the services furnished in an FQHC by a clinical psychologist or clinical social worker are payable under the Medicare program when the services would be covered if furnished by a physician and are of a type that these practitioners are legally permitted to perform by the State in which the services are furnished. Services furnished by a clinical social worker must be for the diagnosis and treatment of mental illnesses and services which the clinical social worker is legally authorized to perform under State law. The practitioners must be employed by or receive compensation from the FQHC. The entity must meet the physician supervision requirements specified in § 491.8(b)(1)(i) and any other requirements in State law. If State law or regulations require that the services of clinical psychologists or clinical social workers be performed under a physician's order and no order was issued, then the services are not

Services and supplies incident to a clinical psychologist's or clinical social worker's services are payable if the services or supply is of a type commonly

furnished in a physician's office, commonly furnished either without charge or included in the FQHC's bill, furnished as an incidental, although integral part of professional services furnished by a clinical psychologist or clinical social worker. The services or supply must also be furnished under the direct, personal supervision of a clinical psychologist, clinical social worker or physician, and in the case of a service, furnished by a member of the center's health care staff who is an employee of the center. Direct personal supervision under the written policies governing the FQHC means that a person is considered to supervise such services. i.e., he or she is immediately available for consultation.

Services and supplies incident to a clinical psychologist's services and a clinical social worker's services are payable if the service or supply is of a type commonly furnished in a physician's office. Section 1861(ii) of the Act, which defines "qualified psychologist services," explicitly includes services and supplies furnished incident to the service furnished by a clinical psychologist. Section 1862(hh) of the Act, which defines "clinical social worker," is silent about coverage of services that are furnished incident to a clinical social worker's services.

Section 1861(aa)(1) of the Act provides that the term "rural health clinic services" means "(B) such services furnished by * * * a clinical social worker (as defined in subsection (hh)(1), and such services and supplies furnished as an incident to his services as would otherwise be covered if furnished by a physician or as an incident to a physician's service * Section 1861(aa)(3) defines Federally qualified health center services to mean (a) services of the type described in subparagraphs (A) through (C) of paragraph (1) * * *" We have concluded that, for purposes of the FOHC benefit, services incident to a clinical social worker's services are covered FQHC services.

Payment provided for FQHC services furnished by clinical psychologists and clinical social workers is subject to the limitations in § 410.155(c).

We also are revising the definition of "visit" in § 405.2401 to recognize clinical psychologists and clinical social workers in the list of practitioners that may provide services in FQHCs. We are not making the corresponding change for RHCs, since we are addressing only provisions of OBRA '90 in this regulation.

C. Payment Provisions

We considered using several methodologies for payment to FQHCs, but because the benefit is so similar to the RHC benefit, we believe that for simplicity and administrative ease, it is more feasible to adopt the RHC methodology for FQHCs.

RHC Payment Methodology

The following is a general description of the payment policy reflected in regulations at 42 CFR part 405, subpart X regarding the RHC methodology.

Medicare reimburses independent RHCs (IRHCs) (i.e., those that are not part of a hospital, skilled nursing facility, or home health agency) on a reasonable cost related basis. Generally, Medicare fiscal agents (intermediaries) provide payment to clinics based on an all-inclusive rate for each visit by a Medicare beneficiary. At the beginning of each reporting period, the intermediary sets the all-inclusive rate based on the clinic's estimates of allowable cost to be incurred by the clinic during the reporting period and the number of visits for RHC services expected to be furnished during the reporting period. The allowability of costs is governed by the applicable principles of reimbursement for provider cost in 42 CFR part 413 and subject to additional tests of reasonableness defined in the RHC regulations at 42 CFR part 405, subpart X.

The term "visit" is defined in § 405.2401(b) as a face-to-face encounter between a patient and a physician, physician assistant, nurse practitioner, nurse midwife, specialized nurse practitioner, or visiting nurse, during which an RHC service is furnished. (We note that, for clarity, the term "nurse practitioner" throughout this document is used to encompass the services of nurse midwives, specialized nurse practitioners, and visiting nurses.) Encounters with more than one health professional and multiple encounters with the same health professional that take place on the same day and at a single location constitute a single visit. except for cases in which the patient, subsequent to the first encounter, suffers an illness or injury requiring additional diagnosis or treatment. In determining the payment rate, the intermediary applies screening guidelines and the maximum payment per visit limitation. The RHC is paid 80 percent of the lesser of the all-inclusive rate or the maximum

deductible amount.

At the end of each reporting period, the clinic must report to the

has fully met the Medicare Part B

payment per visit limit, once the patient

intermediary its actual reasonable costs and the total number of visits for RHC services it actually furnished during the period. The intermediary then adjusts the payments made during that period to equal 80 percent of the net Medicare cost. The net Medicare cost is Medicare covered visits multiplied by the lesser of the adjusted cost per visit or the maximum payment rate per visit less beneficiary deductibles. Intermediaries will add to this amount 100 percent of the Medicare reasonable cost of pneumococcal vaccine and its administration, less payments to the clinic during the reporting period, plus reimbursable bad debts to determine the total amount due to, or from, the Medicare program. We clarify in section 410.152(h)(4) that RHCs and FQHCs are paid 100 percent of reasonable cost for pneumococcal vaccine and its administration. This is a technical correction and consistent with Congressional intent that this service be paid for at 100 percent based on section 1833(a)(1) of the Act.

The all-inclusive rate is subject to tests of reasonableness. The tests include productivity screening guidelines intended to identify situations where costs will not be allowed without acceptable justification by the clinic and limits on the amount of payment. Congress mandated the use of a national payment limit which is adjusted annually by the percentage increase in the Medicare Economic Index applicable to primary care physicians' services. The productivity screening guidelines conform to those set by the Public Health Service for clinics receiving funds from that agency.

As we mentioned, IRHCs are subject to guidelines to test the reasonableness of the productivity of the RHC's health care staff. The guidelines are applied to staff for RHC services furnished both at the clinic site and in other locations. The productivity guidelines are as follows:

 At least 4,200 visits per year per full-time equivalent physician employed by the clinic;

 At least 2,100 visits per year per full-time equivalent physician assistant or nurse practitioner employed by the clinic; or

• If physicians and nurse practitioners or physician assistants are coordinated into a team, at least 6,300 visits per year for each team that consists of a full-time equivalent physician and full-time equivalent nurse practitioner or physician assistant.

The number of "full-time equivalent" employees of each type (i.e., physician, physician assistant, or nurse practitioner) is determined by the following formula: divide the total

number of hours per year worked by all employees of that type by the greater of:

 The number of hours per year for which one employee of that type must be compensated to meet the clinic's definition of a full-time employee; or

 1,600 hours per year (40 hours per week for 40 weeks).

As stated above, IRHCs are subject to guidelines to a maximum payment rate per visit. The limit on payments at the beginning of the program was set at \$27.30 in 1978 with subsequent increases to \$32.10 in 1980, and \$46 in 1988. In OBRA '87, Congress set the limit at \$46, effective April 1, 1988. The statute mandates that the payment limit be updated annually as of the first day of the year by the percentage increase in the Medicare Economic Index (MEI) applicable to primary care physicians' services. (OBRA '89, however, delayed the 1990 update from January 1, 1990 to April 1, 1990.) The payment limits and the MEI increases since April 1, 1988 are as follows:

Payment limit	MEI increase	period		
\$46.00		04/01/88-12/31/88		
\$47.38	3.0%	01/01/89-03/31/90		
\$49.37	4.2%	04/01/90-12/31/90		
\$50.36	2.0%	01/01/91-12/31/91		

The MEI is determined in accordance with section 1842(b)(3) of the Act and regulation at 42 CFR 405.504. The term "primary care services" is defined in section 1842(i)(4) of the Act.

We are redesignating §§ 405.2418 through 405.2430 as §§ 405.2460 through 405.2472 and making technical revisions to reflect that these provisions apply to Medicare payment for FQHC services. The existing sections currently apply only to RHCs.

All references to carrier have been changed to refer to intermediary since intermediaries are the fiscal entities that service RHCs and FQHCs. We originally used the term "carrier" in the regulation because Part B payment is involved and carriers usually process Part B payment. Intermediaries service RHCs and FOHCs because these entities are paid on a cost-related basis instead of a reasonable charge basis. A cost report is used to determine the payment rate for RHCs and FQHCs. Because intermediaries have experience in working with cost reports of providers, intermediaries are used to service RHCs and FQHCs. We have contracted with a single intermediary to process all FQHC claims. The will promote national uniformity in rate setting and review of services, especially preventive services.

Section 405.2427, redesignated as § 405.2466, Annual reconciliation, provides that payments made to an RHC and FQHC during a reporting period are subject to reconciliation to assure that those payments are not greater or lesser than the allowable costs of covered services furnished to Medicare beneficiaries during that period. In paragraph (c), the clinic has the right to appeal the determination to the Provider Reimbursement Review Board (PRRB) if the amount in controversy is at least \$10,000. Section 1878 of the Act was amended by section 4161(a)(6) and (b)(11) of OBRA '90 to include an RHC and an FOHC as a "provider of services," for the purpose of PRRB review of cost reports. In the past, RHCs could only appeal to the intermediary for a hearing if they disagreed with the rate of payment determined by the intermediary at the end of the cost reporting period. Subpart R of part 405 includes procedures for provider reimbursement determinations and appeals. All requirements applicable to appeal procedures in subpart R now apply to both RHCs and FQHCs. This includes the right to a hearing before the PRRB, subject to applicable requirements of the law and subpart R.

FQHC Payment Methodology

The FQHC payment methodology will parallel the RHC payment requirements in new §§ 405.2462 through 405.2472 (redesignated from §§ 405.2425 through 405.2430). We will pay freestanding FQHCs on an all-inclusive rate basis subject to tests of reasonableness. Provider-based FQHCs will be paid on the same basis as provider-based RHCs. The discussion in this section applies to the payment methodology for freestanding FQHCs except as specifically indicated. We require that FQHCs use the RHC cost report (Form HCFA-222), with minor modifications made to accommodate FQHC variations. Certain differences between RHC and FQHC payment methods, however, exist, as described below.

For purposes of payments to FQHCs. one all inclusive rate will be calculated which will include all Medicare covered FQHC services. This includes preventive services as well as the core RHC services. The cost report is being modified to allow for the expanded scope of service under the FQHC benefit. The calculation of the rate is subject to the limits specified in regulation and discussed below. We will address Medicaid payment policy in a separate regulation. Since other ambulatory services are provided for under Medicaid, payment will need to be adjusted for these services.

Additionally, we are modifying the cost report form, HCFA-222, to indicate that the Medicare deductible does not apply to FQHCs, in accordance with section 4161(a)(3)(B) of OBRA '90.

Bad Debts

Since the general reasonable cost principles contained in regulations apply to both provider-based and freestanding FQHCs, there is an allowance for bad debts, in accordance with § 413.80. Recognition of bad debts is subject to specific criteria. For purposes of FQHC payment, bad debts are limited to Medicare coinsurance amounts that remain unpaid by the Medicare beneficiary since no deductible is applied to these services. An FOHC must establish that reasonable efforts were made to collect these coinsurance amounts in order to receive payment for bad debts. Bad debts are only allowed as defined under the reasonable cost rules in § 413.80.

When the FQHC waives coinsurance, it may not claim bad debt amounts for which it assumed the beneficiary's liability OBRA '90 gives a safe harbor from criminal or civil violations under Medicare's anti-kickback rules when an FQHC gives a low-income beneficiary, who qualifies for services subsidized under the PHS Act, a partial or full waiver of Medicare coinsurance amounts based on a PHS-mandated sliding fee scale.

Overall Payment Limits

Sections 1833(a)(3) and 1861(v)(1)(A) of the Act provide general authority to apply cost limits to FQHCs. We intend to apply cost limits to FQHCs under these authorities. We previously discussed in detail how the RHC payment limit is set; however, we will not be applying the same payment limit to FQHCs.

Payment Under Usual Medicare Part B Method

OBRA '90 allows FFHCs electing payment on a reasonable charge basis as of January 1, 1990 to continue under that basis. FQHCs that elect this option will be paid under the Part B payment rules applicable to the particular service, and, for that reason, the usual Part B payment requirements apply. FFHCs electing payment under usual Part B methods are not entitled to be covered, or paid, for the additional FQHC services provided for by OBRA '90; for example, the expansion of payment for preventive primary services as specified in section 4161(a)(8)(B) of OBRA '90. We believe this reflects Congressional intent since section 4161 of OBRA '90 states that the amendment

made by paragraph (3)(A) of that section does not apply to FQHCs electing reasonable charge reimbursement as of January 1, 1990 until the center so elects.

The amendment made by paragraph (3)(A) adds FQHCs to section 1832(a)(2)(D) of the Act. Section 1832(a)(2)(D) provides entitlement to have payment made for FQHC services. Since this amendment does not apply to those FQHCs electing the option for payment under usual Part B methods, there is no entitlement to have payment made for broader FQHC services. These FQHCs will continue to be entitled to receive payment for other Part B services under Medicare, just as in the past. They will not be entitled to payment for the expanded scope of services available as part of the FQHC benefits.

Charge Related to Reasonable Cost Payment

FFHCs were paid based on charges related to reasonable cost. FFHCs receiving payment under this methodology were brought under the FQHC benefit which requires payment based on section 1833(a)(3) of the Act. Since this benefit requires payment under §§ 410.152(j) and 411.8(b)(6), based on methods specified under section 1833(a)(3) of the Act, payment based on charges related to reasonable cost is no longer applicable to entities receiving section 329, 330, and 340 PHS grants as of the effective date of the legislation, October 1, 1991.

Cost Reporting Period

Payment for FQHC services will be made to the center for the cost of services incurred as of the effective date of its FQHC participation. Institutions will be provided from the servicing intermediary or carrier as to the procedures necessary to make the transition from the present form of payment to an FQHC. These instructions will be provided to:

- FFHCs paid based on charges related to reasonable cost;
- RHCs paid on a reasonable cost related basis; and
- Entities currently paid under usual Part B payment rules through the carrier.

The FQHC payment methodology differs from the methodology applicable to centers eligible under the FFHC benefit. There were approximately 246 FFHCs as of January 1991. FFHCs will have the option to begin a new cost reporting period as of the effective date of their FQHC participation or they may maintain the cost reporting period they are presently using. In the latter case, the entity would submit both the FFHC

cost report and the FQHC cost report 90 days after the end of the entity's cost reporting period. The FFHC cost report will apply to the period up until FQHC participation begins and the FQHC cost report will apply until the end of the FQHC's reporting period. The FFHC methodology and cost report will not be applicable after the date of publication of this regulation except as provided for in the exceptions process.

Outpatient Clinical Diagnostic Laboratory Tests

We will pay for outpatient clinical diagnostic laboratory tests in FQHCs the same way we pay for them in RHCs. In general, under Medicare Part B, a fee schedule applies to all clinical diagnostic laboratory tests with some exceptions. One exception in which the fee schedule does not apply is to clinical diagnostic laboratory tests furnished to patients of an RHC under an allinclusive rate. However, payment is made on a fee schedule basis for purchased clinical diagnostic laboratory tests furnished to Medicare patients by an independent laboratory. Claims for such services should be billed directly to the Medicare carrier for payment and should not be included in the calculation of the all-inclusive rate. Section 1833(h) of the Act discusses clinical diagnostic laboratory tests. Payment for outpatient clinical diagnostic laboratory tests is further discussed in section 5114.1 of the Carriers Manual.

Lower of Cost or Charges

Reimbursement for services provided in provider-based FQHCs will be made on the same basis as payment as provider-based RHC services. Presently, as an element of Medicare's cost reimbursement principles, the lesser of costs or charges (LCC) principle applies to the whole of a provider's outpatient area, including the provider-based RHC. We intend that LCC continue to apply to the whole of the outpatient areas, including provider-based FQHCs. We have chosen to be consistent with the RHC policy and not apply LCC to freestanding FQHCs.

While deliberating on this change in the regulations, we considered applying LCC separately to the FQHC. We knew that in providing for payment to FQHCs, the statute requires payment to be made on a reasonable cost-related basis or based on such other tests of reasonableness prescribed in regulations, including the reasonable cost principles. Furthermore, section 1833(b)(5) of the Act provides that the deductible will not apply to FQHC services. Also, coinsurance may be waived (see section 1128B(b)(3)(D) of

the Act) for those individuals that qualify for subsidized services under a provision of the Public Health Service Act. However, we eventually rejected the separate approach for two reasons. First, it would not be consistent with the method of payment for provider-based RHCs and our treatment of Medicare providers in general. Second, we believe that a separate application of LCC to FQHCs would probably not have a very different result than its application to the outpatient department as a whole because one requirement for establishing an FQHC is that it must be located in a medically-underserved area or medically-underserved population (MUA/MUP). The designation process for becoming an MUA/MUP takes into consideration the percentage of the population that is below the poverty line. Accordingly, patients served by the provider's outpatient department would be reflective of the population in the MUA/MUP

Under the LCC principle, of course, the provider may avoid application of LCC by meeting one of the LCC exceptions contained in § 413.13(c); for example, given the low-income status of a number of patients, the hospital could meet the nominal charges test (i.e., if a significant portion of its patients are low income and its charges are less than costs because its customary practice is to charge patients based on their ability to pay), and therefore, it would not be subject to an LCC disallowance.

Tests of Reasonableness

Tests of reasonableness for RHC cost and utilization are set in accordance with § 405.2428, Allowable costs, which we propose to redesignate as § 405.2468. This section addresses application of the productivity screening guidelines intended to identify situations in which costs will not be allowed without reasonable justification by the clinic.

On December 1, 1982, a final notice was published at 47 FR 54163, which established revised productivity screening guidelines, eliminated overhead screening guidelines and revised the upper payment limit.

Currently, the RHC productivity screening guidelines include visits of physicians, physician assistants, and nurse practitioners. As discussed previously, OBRA '87 expanded coverage to allow for payment to clinical psychologists, and OBRA '89 expanded coverage to clinical social workers. The all-inclusive rate will be paid for visits of these practitioners. We considered applying the same productivity screening guideline that is used for a physician assistant and nurse practitioner (at least 2,100 visits per year

per full-time equivalent) to the clinical psychologist and the clinical social worker, but because we have not had sufficient experience with measuring appropriate productivity levels, we will not apply these screening guidelines at this time. Also, as mentioned previously, the RHC productivity screening guidelines conform to those set by the Public Health Service. Currently, the Public Health Service guidelines do not include clinical psychologists or clinical social workers.

We intend to look at the productivity of the clinical psychologist and clinical social worker in the future to determine what productivity screening guidelines can be appropriately applied to these practitioners. We intend to publish these guidelines in the Federal Register for public comment. In the meantime, they will be treated on the cost report in the same manner as physicians under agreement with the clinic, which is, their total visits will be added to total clinic visits of physicians, physician assistants and nurse practitioners to determine the cost per visit. However, in § 405.2468, we add clinical psychologists and clinical social workers to the list of practitioners which are included in allowable costs for RHCs and FQHCs and to the list of practitioners subject to screening guidelines.

In § 405.2425, Payment for rural health clinic and Federally qualified health center services, and § 405.2428, Allowable costs, (redesignated as §§ 405.2462 and 405.2468, respectively), we change the cross reference to subpart D to cross refer to part 413 instead. This is merely a conforming change; Subpart D was incorporated in part 413 several years ago.

Combined Screening Approach

Section 4161(b)(3) of OBRA '90 states. "In employing any screening guideline in determining the productivity of physicians, physician assistants, nurse practitioners, and certified nursemidwives in an RHC, the Secretary of Health and Human Services shall provide that the guideline shall take into account the combined services of such staff (and not merely the service within each class of practitioner)." In the past, screening guidelines allowed for teams providing at least 6,300 visits (encounters) per year. A team consisted of a physician and at least one other practitioner. OBRA '90 requires a broader approach.

In implementing the OBRA '90 provisions, we will apply a broader approach by applying a guideline that reflects the total combined services of the staff regardless of whether there is a

"team." We will use a level of 4,200 visits for each physician and a level of 2,100 visits for each nonphysician practitioner. Rural health clinic staffing levels could consist of various combinations of practitioners and the productivity screen would reflect the total combination of services. For example, if a clinic has three physicians and one nurse practitioner, we calculate a limit as follows: 3 × 4,200 = 12,600 + $1 \times 2,100 = 2,100 \{12,600 + 2,100 =$ 14,700). Another example would be a clinic with four non-physician practitioners (4 \times 2,100 = 8,400). At this time, we do not intend to apply the productivity screen to clinical psychologists and clinical social workers.

Screening Guideline for Purchased Physicians' Services

FOHCs will be subject to the same screening guideline for purchased physicians' services as RHCs. The current RHC guideline is outdated. It limits the costs of purchased physicians' services to the reasonable charges for these services as determined under Subpart E. Because a fee schedule is now used for Medicare Part B payment of physicians' services provided on or after January 1, 1992, we are adding to § 405.2468(d)(2)(v), previously § 405.2428(d)(2)(v), a reference to Part 415 to reflect that in determining the guideline for purchased physicians' services, we will look to payments for Medicare physicians' services under the fee schedule which was effective January 1, 1992.

Payment Limits

The FQHC payment limit is set in accordance with the requirements of OBRA '90 specifying payment for FQHC services and under the authority of sections 1833(a)(3) and 1861 (v)(1) of the Act.

The all-inclusive rate will be compared to the payment limit. The FQHC will be paid 80 percent of the lesser of the all-inclusive rate or the payment limit.

For FQHC services there will be two FQHC payment limits. One limit will apply to entities located in urban areas and one limit will apply to entities located within rural areas. In general, each FQHC payment limit will consist of a core component and a preventive services adjustment. There will be one payment limit applied to all FQHC services, both core and preventive. Beginning October 1, 1991, the rural core component is \$59.65 and the rural preventive service adjustment is \$2.60.* The total rural limit is \$62.25. Also beginning October 1, 1991, the urban

core component is \$69.37 and the urban preventive service adjustment is \$3.02. The total urban FQHC payment limit is \$72.39.

Both the rural and urban limit are adjusted annually by the percentage increase in the Medicare Economic Index (MEI) applicable to primary care physicians' services.

The core services component will be the RHC limit computed in accordance with section 1833(f) of the Act with an adjustment for the projected FQHC visit mix. The \$50.36 RHC limit, \$2.30 adjustment to the RHC limit to reflect different visit mix, and the \$6.99 primary practitioner adjustment form the 1991 rural FQHC core limit component of \$59.65.

General Core Services Limit Component (Rural)

Since RHC and FQHC core services are essentially identical, we believe the RHC payment limit computed in accordance with section 1833(f) of the Act is an appropriate base for the FQHC core component. In general, RHC and FQHC core components consist of the following identical services: physician, physician assistant, nurse practitioner, clinical psychologist, clinical social worker services, and services and supplies incident to these services. The calendar year 1991 RHC limit is \$50.36.

Adjustment to RHC Limit to Reflect Different Visit Mix

Since FFHCs and entities eligible for section 329, 330, and 340 grants will comprise the majority of entities qualifying for the FQHC program, we anticipate that the use of physician services in FQHCs will be comparable to the FFHC setting. A study of RHC and FFHC visit data was conducted to determine whether there is a difference in the percentage of physician visits as a percentage of total visits between the RHC and FFHC settings. Visit data from RHC cost reports indicate that physician visits comprise 59 percent of total visits, while data from FFHC cost reports indicate that physician visits are 83 percent of total visits. The RHC limit corresponds with the RHC visit mixture of 59 percent physician and 41 percent non-physician practitioner visits. We adjusted the RHC limit to account for the projected 83 percent physician and 17 percent non-physician practitioner

The magnitude of the adjustment also reflects the difference in payments between a physician service and a physician assistant or nurse practitioner service. Under Medicare Part B, the average amount of payments for nurse practitioners (section 1833(r)(2)(B) of the

Act) and physician assistants (section 1842(b)(12)(B) of the Act) are 80 percent of what a physician would be paid for the same service.

Based on these data, we adjusted the practitioner component of the RHC limit. We estimate the practitioner component to be \$44.32 (\$50.36 less a 12 percent allowance for a lab service). We derived the 12 percent lab allowance as follows. Since the calculation of the original RHC limit included an allowance for a glucose blood test, the lab percentage (as a percentage of the total RHC limit) was calculated using the glucose blood test national allowable charge of \$6.26 (1989 inflated to 1991). This amount is approximately 12 percent of the RHC limit. Taking these factors into consideration, we calculated a 5.2 percent adjustment to the practitioner component of the RHC limit:

- Physician visits increased from 59 percent of the total visits to 83 percent.
- Nursing practitioners and physician assistants are paid generally 80 percent of what a physician would be paid for the same Medicare service.
- The unadjusted practitioner component of the RHC limit is \$44.32.

Primary Care Family Practice Adjustment

Section 6102 of OBRA '89 added section 1848 of the Act, which is the authority for the physician fee schedule. The physician fee schedule resulted in a general increase in payment of approximately 15 percent for family practice physicians. We believe that it is appropriate to reflect a similar increase for FQHC payment purposes. Application of the 15 percent adjustment to the already adjusted practitioner portion of the core component (practitioner base plus adjustment to RHC limit to reflect different visit mix) yields a \$6.99 increase over what the practitioner component amount would otherwise be.

General Core Services Limit Component (Urban)

We recognize the potential for higher FQHC operating costs within urban areas. Since FQHCs may be located in urban as well as rural areas, we believe that it is necessary to have a separate payment limit applicable for entities located within an urban area. This limit is the FQHC core limit, as described above, increased by 16.3 percent. Application of the urban area adjustment yields a 1991 urban core limit component of \$69.37.

Urban Area Adjustment

To determine the urban FQHC payment limit adjustment, a cost per visit comparison was conducted for cost-based Federally Funded Health Centers (FFHC's) (133 urban, 80 rural) based on entity-specific 1990 costs per visit. FFHC costs per visit were selected for our analysis because these entities are eligible for FQHC approval, are considered representative of FQHCs and are located in every region of the country.

In our analysis, an urban area is defined as a Metropolitan Statistical Area (MSA) or New England County Metropolitan Area (NECMA) (New England). An urban area can be classified as either a "large urban area" or "other urban area." A rural area is any area that is not in an MSA or NECMA and can not be classified as a large or other urban area.

The interim 1990 median urban FFHC cost per visit is 16.3 percent more than the interim 1990 median rural FFHC cost per visit. To accommodate the anticipated urban FQHC cost difference, the rural FQHC core component (as described in the above general core services section), is increased by 16.3 percent for entities located within an urban area.

FQHC Designation as Urban or Rural

An FQHC will be designated as an urban or rural entity based on the urban and rural definitions in section 1886(d)(2)(D) of the Act. The urban and rural definitions are discussed below.

- —Urban Area: An urban area is defined as a Metropolitan Statistical Area (MSA) or New England County Metropolitan Area (NECMA) (New England). An urban area can be classified as either a "large urban area" or "other urban area." A large urban area means an urban area with a population of more than one million (or more than 970,000 in New England) as determined by the Secretary using the most recent available population data published by the Bureau of Census. An other urban area means an urban area that is not a large urban area.
- —Rural Area: A rural area is any area outside a large urban area or other urban area as defined above.

If an FQHC is located within an MSA or NECMA and can be classified as a large or other urban area as determined by the Bureau of Census, then the urban limit will apply. If an FQHC is not in an MSA or NECMA and can not be classified as a large or other urban area, the rural limit will apply.

Preventive Service Adjustment

OBRA '90 allows FQHC coverage to include certain services that are for preventive purposes. To determine the appropriate adjustment for preventive services, we depended largely upon the recommended preventive services for ages 65 and older in the U.S. Preventive Services Task Force's Guide to Clinical Preventive Services (1989). The preventive service adjustment will be added to the core component, which will be applied to each all-inclusive rate per visit without regard to whether the visit is for provision of a preventive service of other Medicare FOHC covered services. Either an urban or rural limit, as appropriate, will be applied to the allinclusive rate per visit without regard to type of service. The core component already represents practitioner services. The preventive service adjustment accounts for those preventive services that would not be considered part of a physician visit. (Such services as a general physical exam and preventive individual counseling related to diet and exercise, substance abuse, and injury prevention are considered part of a preventive physician visit.) We based our determination to account for those preventive services outside a physician visit largely upon a study undertaken to estimate the cost of preventive care at the levels recommended by the U.S. Preventive Service Task Force ("Cost for Preventive Care According to the Recommendation of the U.S. Preventive Task Force," Trapnell and Chu, September 1989). This study estimates that the cost of a preventive service physician visit is comparable to an extended physician office visit under Medicare Part B. Further, the Medicare Part B procedure file indicates that the national average allowable charge for an extended physician visit is less than the base portion of the FQHC core component. This comparison illustrates that payments for a preventive physical exam have been accounted for within the base portion of the FQHC core component.

Additionally, we included a factor for high risk procedures, as defined by the U.S. Preventive Service Task Force, in the preventive service adjustment. We selected the fecal occult blood test as a common high risk procedure. The addition of this service does not indicate that this service will be provided during each visit, but it is used as an allowance for high risk procedure costs attributable to some preventive visits.

To determine the preventive service adjustment, an estimated lifetime Medicare preventive service cost was calculated from a model preventive check-up schedule covering a 21 year period for ages 65 through 85 (The estimated Medicare life time preventive service cost was calculated from services that could not be adequately accounted for within the FQHC core limit component). In addition, the national average allowable charge updated to the current period (1991), of individual services were obtained from the Medicare Part B system's national procedure file. A yearly cost was determined by dividing the Medicare lifetime cost by 21 years.

Further, the yearly Medicare preventive services cost estimate was adjusted by the percentage of preventive visits (as a percentage of total visits). This adjustment represents the yearly preventive services cost amount on a per visit basis and accounts for the percentage of patients that will utilize preventive services. We estimate that 10 percent of the total visits will be attributed to preventive services. This estimate was derived after researching current studies on this subject. These studies include the following: Wagner, Edward H. MD. MPH., Bledsoe, Turner, MD., "The Rand Health Insurance Experiment and HMO's Study," Medical Care, March 1990, Vol. 28, No. 3; and Manning, Willard G., Leibowitz, Arleen, et. al., "A Controlled Trial of the Effect of a Prepaid Group Practice on Use of Services," New England Journal of Medicine, June 1984, Vol. 310, No. 23.

Services and Frequency of Preventive Utilization

Recommended preventive services for the Medicare population were based on the U.S. Preventive Services Task Force Guide to Clinical Preventive Services (1989). Utilization of preventive services is based on the utilization estimates (when available) in the preventive study undertaken by Trapnell and Chu to estimate the cost of preventive care at the levels recommended by the Task Force. We used the utilization figures representing the "more frequent" use of preventive services. When no preventive service utilization estimates were available, we consulted with HCFA staff physicians to derive estimates.

Calculation of the addition includes the following services with recommended frequency of utilization:

- Non fasting total blood cholesterol, every 5 years;
- -Dipstick urinalysis, every 2 years;
- thyroid function tests, (females only) every 3 years;
- Hearing Screening every 2 years;
 Tetanus-Diphtheria (TD) booster,
 every 10 years;

-Fecal occult blood testing, every year; -Influenza vaccine, every year.

Preventive services, costs, and utilization assumptions are detailed below.

PREVENTIVE SERVICE ADJUSTMENT WORKSHEET

[(Model Medicare preventive service check-up schedule); Preventive Service 1 w/ CPT Code]

Preventive services recommended by the U.S. Preventive Service Task Force for ages 65 and older. "Pass throughs," and services adequately accounted for within the core limit, have not been included. CPT codes were obtained from the 1991 Physicians Current Procedural Terminology.

*Preventive Thyroid Function test is recommended for Fernales only.

*Utilization of services are based primarily on "Cost for Preventive Care According to Recommendations of the U.S. Preventive Task Force" (more frequent use of services), Trapnell and Chu 1989.

*Charges for services were obtained from the Medicare Part 8 system's national procedure file and represent the national allowable charge.

Preventive Service Adjustment (Rural)

To determine the rural adjustment, the national average was adjusted by the percent difference between:

- . The \$46 median 1990 FFHC cost per visit for all FFHC's utilized in the urban/ rural cost per visit comparison; and
- The \$43 median 1990 rural FFHC cost per visit.

The median interim 1990 rural FFHC cost per visit is 6.5 percent less than the interim 1990 median cost per visit for all (213) FFHCs included in the urban analysis. Therefore, the national average Medicare preventive cost per visit was decreased by 6.5 percent for rural entities yielding a rural preventive service adjustment of \$2.60.

Preventive Service Adjustment (Urban)

We recognize that all components of the FQHC payment limit need to be adjusted for potentially higher costs within urban areas. As with the core component, there will be a separate preventive service addition applicable to entities located within an urban area. Beginning October 1, 1991, the urban preventive service adjustment is \$3.02. The national average allowable charges were adjusted by the percent difference between:

- . The \$46 median 1990 FFHC cost per visit for all FFHCs utilized in the urban/ rural cost per visit comparison; and
- · The \$50 median 1990 urban FFHC cost per visit.

The median interim 1990 urban FFHC cost per visit is 8.7 percent more than the interim 1990 median cost per visit for all (213) FFHCs included in the urban/ rural analysis. Therefore, the national average per visit preventive services adjustment was increased by 8.7 percent for urban entities yielding an urban preventive service adjustment of \$3.02.

Payment for Pneumococcal Vaccine

Calculation of the preventive service adjustment excludes pneumococcal vaccines and their administration. This service will be treated as a "pass through" and will not be included within the all-inclusive rate and also will not be subject to the cost per visit limit. When pneumococcal vaccines are furnished by an FOHC, the cost for this service will be accounted for on the FQHC cost report and the FQHC will bill the intermediary for pneumococcal vaccines. Medicare payment for pneumococcal vaccine and its administration is 100 percent of reasonable cost.

Annual Payment Limit Adjustment

Medicare will pay FQHCs based on the entity's reasonable cost incurred in furnishing covered FOHC services to Medicare beneficiaries. Payments are based on an all-inclusive rate, subject to a payment limit, for each visit by a Medicare beneficiary for covered services.

The payment limit for an FOHC is \$62.25 (rural) and \$72.39 (urban) for covered services provided October 1, 1991-December 31, 1991. For services furnished on or after January 1 of each subsequent year the payment limit is increased as of the first day of the year by the percentage increase in the MEI applicable to primary care physicians' services.

The MEI is defined in section 1842(i)(3) of the Act and regulations at § 405.509(a)(3) and issued in accordance with section 1842(b)(3) of the Act and regulations at § 405.504. The term "primary care services" is defined in section 1842(i)(4) of the Act.

Changes in the Limit

Updates will be published annually through a routine program issuance such as a manual issuance. Any changes in the methodology used in calculating the limit will be published in the Federal Register in accordance with the

Department's established rulemaking procedures.

Exception Option for Current FFHCs

FFHCs paid on a charge related to cost basis as of September 30, 1991 may request an exception to the cost limits.

A payment adjustment can be made only to the extent the costs are reasonable under Medicare principles of payment, attributed to the circumstances specified below and verified by the intermediary.

There is only one basis for an exception. An FFHC must document a disadvantage due to a decrease in revenues as a result of the application of the FQHC payment limit. This determination will be made based on a filing of the FFHC cost report subject to the current FFHC State by State limits. The FFHC cost report to support a request for an exception must be submitted to the FQHC fiscal intermediary within 180 days of the date of the intermediary's initial notice of program reimbursement. The amount of the exception will be calculated based on payments that would be made using the FFHC methodology and cost report. This amount is based on the lower of the FFHC all-inclusive rate or the applicable FFHC limit multiplied by the number of physician encounters, consistent with current FFHC payment procedures. The FFHC limits will be adjusted to reflect the FQHC scope of services. This adjustment will result in a slight increase to the FFHC payment limit.

This exception is limited to three cost reporting periods ending August 31, 1995. This may include 3 full year cost reports or a combination of 1 partial and 2 full years. A separate exception request must be filed each year. This approach is an interim approach. Actual cost report data for FOHCs will be gathered and analyzed during this period of time. The limits imposed in this regulation will be evaluated and adjusted as necessary based on these data. A proposed notice will be issued and the public will have an opportunity to comment on any change in methodology used to compute the limits.

Response to Comments

Because of the large number of items of correspondence we normally receive on a final rule with comments, we are not able to acknowledge or respond to them individually. However, in preparing any subsequent final rule, we will consider all comments that we receive by the date and time specified in the "DATES" section of this preamble, and we will respond to the comments in the preamble of that rule.

Waiver of Proposed Rulemaking

We normally publish a notice of proposed rulemaking in the Federal Register and afford public comment on proposed rules. Such notice includes a statement of the time, place, and nature of rulemaking proceedings, reference to the legal authority under which the rule is proposed, and the terms or substance of the proposed rule or a description of the subjects and issues involved. However, section 4207(j) of OBRA '90 provides authority to the Secretary to issue interim final rules to implement the provisions of OBRA '90. The provisions contained in these final regulations implement section 4161 of OBRA '90 and, thus, their publication as interim final rules is authorized by section 4207(j) of that law. We are, however, affording the public an opportunity to comment on these regulations, following publication.

Waiver of 30-Delay in Effective Date

These regulations provide the authority for HCFA to increase access to primary health care and primary preventive services by entering into agreements with entities that can provide such services to Medicare beneficiaries. We believe that it is important to have these rules in effect as soon as possible, so as to expedite the availability of FQHC services, and that no compelling purpose would be served by delaying the effective date beyond the date of publication. We therefore find good cause to waive our normal 30-day delay in effective date.

Revisions to the Regulations

We are making the following revisions to the regulations in title 42:

(1) In part 405, we redesignate existing §§ 405.2418 through 405.2430 as §§ 405.2460 through 405.2472, which specify the Medicare payment methodology applicable to RHC and FQHC services.

(2) We add new §§ 405.2430 through 405.2448 to part 405 to specify the scope of services of the Medicare FQHC benefit, qualification requirements, content and terms of the provider agreement, termination of the agreement, notice requirements, appeals and other general requirements.

(3) In parts 400, 407, 410, 417, 420, 424, 488, 491 and 498 we add references to FQHCs since they are a new category of suppliers of services.

Collection of Information Requirements

Sections 405.2440, 405.2470(a), (b), and (c), 491.9(b)(3), and 491.10 contain information collection or recordkeeping requirements, or both, that are subject to

review by the Office of Management and Budget under the Paperwork Reduction Act of 1980 (44 U.S.C. 3501 et seq.). The information collection requirements concern the notice to the public given by an FQHC that, in accordance with § 405.2440, voluntarily terminates its agreement with HCFA. The respondents who will provide the information include FQHCs. Public reporting burden for this collection of information is estimated to be 5 hours per FQHC that voluntarily terminates its agreement. We estimate that only about 10 such organizations may do so annually. Section 405.2470 (a), (b), and (c) provides reports and maintenance of records requirements for RHCs and FQHCs. We estimate that it will take 10 hours for an entity to complete the required cost report. We estimate that approximately 800 entities will be required to use the cost report to receive Medicare payment. This estimate reflects entity projections over the next 5 years.

In accordance with 42 CFR 491.9(b)(3) each center must have in place a description of the services the center furnished or directed and those treated; guidelines for management of health problems; and rules for managing drugs and biologicals. We estimate that the effort of centers that have not already met this requirement will take approximately 10 hours. We estimate the number of "new" centers to be approximately 350. Annual review may take approximately 2 hours. Clinic records are maintained in accordance with accepted professional standards and practice. The information required by 42 CFR 491.10 with respect to clinical records is consistent with good medical practice and is already followed by the majority of the centers. Since many entities would already be in compliance and collect this information to some extent, it is estimated that it would take each center approximately 26 additional hours per year for approximately 800 centers to comply with this requirement.

These requirements have been sent to OMB for its review pursuant to the requirements of the Paperwork Reduction Act. Organizations and individuals desiring to submit comments on the information collection and recordkeeping requirements should direct them to the OMB official whose name appears in the "ADDRESS" section of this preamble.

Regulatory Impact Statement

A. Introduction

Executive Order 12291 (E.O. 12291) requires us to prepare and publish a

regulatory impact analysis for any proposed regulation that meets one of the E.O. 12291 criteria for a "major rule"; that is, that would be likely to result in—

 An annual effect on the economy of \$100 million or more;

 A major increase in costs or prices for consumers, individual industries,
 Federal, State, or local government agencies, or geographic regions; or

 Significant adverse effects on competition, employment, investment, productivity, innovation, or on the ability of United States-based enterprises to compete with foreignbased enterprises in domestic or export markets.

In addition, we generally prepare a final regulatory flexibility analysis that is consistent with the Regulatory Flexibility Act (RFA) (5 U.S.C. 601 through 612) unless the Secretary certifies that a final regulation will not have a significant economic impact on a substantial number of small entities. For purposes of the RFA, we consider all FFHCs, FQHCs and RHCs to be small entities. Individuals and States are not included in the definition of a small entity.

In addition, section 1102(b) of the Act requires the Secretary to prepare a regulatory impact analysis if this rule has a significant impact on the operations of a substantial number of small rural hospitals. Such an analysis must conform to the provisions of section 604 of the RFA. For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that has fewer than 50 beds and is located outside a Metropolitan Statistical Area.

B. Statutory Changes

These provisions generally reflect changes made by recent legislation (OBRA '90). OBRA '90 provides for payment to FQHCs, not only for primary health care services already covered by Medicare in rural health clinics, but also for preventive primary health services not previously covered by Medicare. Under the OBRA '90 provisions. payment is made to FQHCs for each face-to-face encounter between a physician, physician assistant, nurse practitioner, clinical psychologist, and clinical social worker. Previously, Federally Funded Health Clinics (FFHCs) receiving grants under sections 329 and 330 of the PHS Act were paid only for a face-to-face encounter with a physician. As a result of OBRA '90, many FFHCs will qualify as FQHCs in addition to clinics which are not actually PHS grant recipients but which the PHS recommends as qualified candidates for designation as FQHCs.

We estimate that these provisions will potentially affect approximately 800 entities over the next 5 years. These entities include approximately 850 community and migrant health center grantees (PHS grantees under section 329 and 330 of the PHS Act) and 90 homeless center grantees (PHS grantees under section 340 of the PHS Act) as well as a number of entities that meet the requirements to receive such a grant based on recommendations of the PHS and determined by the Secretary.

C. Positive Impact on Health Status

This regulation will expand Medicare payment to community health centers (CHCs) and similar entities that qualify as FQHCs and serve the working poor. Some of these organizations are under economic pressures to provide services to people who have turned to them as their first source providers. This new type of provider is also able to offer preventive services, a benefit not generally available to Medicare beneficiaries and an underpinning to improving overall health status of Americans.

D. Reporting Requirements

Reporting requirements will be less burdensome than previous requirements under the FFHC cost-based payment methodology. Changes in reporting requirements are part of the many benefits for FQHCs. FQHCs will be spared the administrative costs of preparing three cost reports annually. (FFHC's are required to submit three cost reports yearly: a projected, semi-annual, and annual report). The FQHC methodology will require only two reports per cost reporting year, a projected and an annual report.

E. Administrative Costs

Administrative costs are minimally affected as follows:

 Current claims volume for FFHCs is approximately 40,000 per month—fewer than 500,000 per year;

 These regulations are estimated to increase claims volume by 100,000 per year and

 Any costs to be incurred as a result of the implementation of these regulations will be funded out of current OBRA '90 budget disbursements.

We have determined, and the Secretary certifies, that this rule does not meet the requirements to be determined a major rule nor does it meet criteria as having a significant economic impact on a substantial number of small entities. Also, this rule would not have a significant impact on the operations of a substantial number of small rural hospitals. Therefore, we have not

prepared a regulatory impact analysis, a small rural hospital analysis, or an initial regulatory flexibility analysis.

List of Subjects

42 CFR Part 400

Grant programs-health, Health facilities, Health maintenance organizations (HMO), Medicaid, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 405

Administrative practice and procedure, Health facilities, Health professions, Kidney diseases, Medicare, Reporting and recordkeeping requirements, Rural areas, X-rays.

42 CFR Part 407

Medicare.

42 CFR Part 410

Health facilities, Health professions, Kidney diseases, Laboratories, Medicare, Rural areas, X-rays.

42 CFR Part 417

Administrative practice and procedure, Grant programs-health, Health care, Health facilities, Health insurance, Health maintenance organizations (HMO), Loan programs-health, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 420

Fraud, Health facilities, Health professions, Medicare.

42 CFR Part 424

Emergency medical services, Health facilities, Health professions, Medicare.

42 CFR Part 488

Health facilities, Medicare, Reporting and recordkeeping requirements.

42 CFR Part 491

Grant programs-health, Health facilities, Medicaid, Medicare, Reporting and recordkeeping requirements, Rural areas.

42 CFR Part 498

Administrative practice and procedure, Health facilities, Health professions, Medicare, Reporting and recordkeeping requirements.

TITLE 42-PUBLIC HEALTH

CHAPTER IV—HEALTH CARE FINANCING ADMINISTRATION, DEPARTMENT OF HEALTH AND HUMAN SERVICES

42 CFR chapter IV is amended as follows:

A. Part 400 is amended as follows:

PART 400—INTRODUCTION; DEFINITIONS

1. The authority citation for part 400 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act [42 U.S.C. 1302 and 1395hh] and 44 U.S.C. chapter 35.

 Section 400.200 is amended by adding a definition for FQHC in alphabetical order and reprinting the introductory language to read as follows;

Subpart B-Definitions

§ 400.200 General definitions.

In this chapter, unless the context indicates otherwise—

FQHC means Federally qualified health center.

PART 405—FEDERAL HEALTH INSURANCE FOR THE AGED AND DISABLED

- B. Part 405 is amended as follows:
- The authority citation for part 405 subpart E is revised to read as follows:

Authority: Secs. 1102, 1814(b), 1832, 1833(a), 1834(b), 1842(b) and (h), 1848, 1861(b), (v) and (aa), 1862(a)(14), 1866(a), 1871, 1881, 1886, 1887, and 1889 of the Social Security Act as amended (42 U.S.C. 1302, 1395f(b), 1395k, 1395l(a), 1395m(b), 1395u(b) and (h), 1395w-4, 1395x(b), (v) and (aa), 1395y(a)(14), 1395cc(a), 1395hh, 1395rr, 1395ww, 1395xx, and 1395zz).

2. Section 405.501(b) is revised to read as follows:

§ 405.501 Determination of reasonable charges.

- (b) Part B of Medicare pays on the basis of "reasonable cost" (see part 413 of this chapter) for certain institutional services, certain services furnished under arrangements with institutions, and services furnished by entities that elect to be paid on a cost basis (including health maintenance organizations, rural health clinics, Federally qualified health centers and end-stage renal disease facilities).
- 3. Section 405.502(f)(4) is revised to read as follows:

§ 405.502 Criteria for determining reasonable charges.

(f) Determining charge payments for certain physician services furnished in outpatient settings. (4) Services excluded from limits. The limits established under this paragraph do not apply to the following:

(i) Rural health clinic services.

(ii) Surgical services included on the ambulatory surgical center list of procedures published under § 416.65(c) of this chapter.

- (iii) Services furnished in a hospital emergency room after the sudden onset of a medical condition manifesting itself by acute symptoms of sufficient severity (including severe pain) such that the absence of immediate medical attention could reasonably be expected to result in—
- (A) Placing the patient's health in serious jeopardy;
- (B) Serious impairment to bodily functions; or
- (C) Serious dysfunction of any bodily organ or part.
- (iv) Anesthesiology services and diagnostic and therapeutic radiology services.
- (v) Federally qualified health center services paid under the rules in part 405 subpart X.
- 4. The authority citation for subpart X is revised to read as follows:

Authority: Sec. 1102, 1833, 1861(aa), 1671, Social Security Act; 42 U.S.C. 1302, 13951, 1395(aa), and B95hh.

The title of subpart X is revised to read as follows:

Subpart X—Rural Health Clinic and Federally Qualified Health Center Services

6. Section 405.2401 is amended by revising paragraph (a), in paragraph (b) by removing the arabic number designations for each definition, substituting arabic numbers for lower case Roman numerals, substituting lower case Roman numerals for upper case letters, adding a new definition of Federally qualified health center, and revising the definitions of allowable cost, deductible, reporting period, and visit to read as follows:

§ 405.2401 Scope and definitions.

(a) Scope. This subpart establishes the requirements for coverage and reimbursement of rural health clinic and Federally qualified health center services under Medicare.

(b) Definitions. As used in this subpart, unless the context indicates otherwise:

Allowable costs means costs that are incurred by a clinic or center and are reasonable in amount and proper and necessary for the efficient delivery of rural health clinic and Federally qualified health center services.

Deductible means: (1) The first \$100 of expenses incurred by the beneficiary during any calendar year for items and services covered under Part B of title XVIII; and

(2) The expenses incurred for the first 3 pints of blood or 3 units of packed red blood cells furnished to a beneficiary during any calendar year. (See §§ 410.160 and 410.161 of this chapter for greater detail.)

Federally qualified health center (FOHC) means an entity that has entered into an agreement with the HCFA to meet Medicare program requirements under §§ 405.2434 and—

- (1) Is receiving a grant under section 329, 330, or 340 of the Public Health Service Act, or is receiving funding from such a grant under a contract with the recipient of such a grant and meets the requirements to receive a grant under section 329, 330 or 340 of the Public Health Service Act;
- (2) Based on the recommendation of the PHS, is determined by the Secretary to meet the requirements for receiving such a grant; or
- (3) Was treated by the Secretary, for purposes of Part B, as a comprehensive federally funded health center (FFHC) as of January 1, 1990.

Reporting period means a period of 12 consecutive months specified by the intermediary as the period for which a clinic or center must report its costs and utilization. The first and last reporting periods may be less than 12 months.

Visit means a face-to-face encounter between a clinic or center patient and a physician, physician assistant, nurse practitioner, nurse midwife, specialized nurse practitioner or visiting nurse. For Federally qualified health centers, a visit also means a face-to-face encounter between a patient and a qualified clinical psychologist or clinical social worker. Encounters with more than one health professional and multiple encounters with the same health professional which take place on the same day and at a single location constitute a single visit, except for cases in which the patient, subsequent to the first encounter, suffers illness or injury requiring additional diagnosis or treatment.

7. Section 405.2410 is revised to read as follows:

§ 405.2410 Application of Part B deductible and coinsurance.

(a) Application of deductible. (1)
Medicare payment for rural health clinic
services begins only after the
beneficiary has incurred the deductible.

(2) Medicare payment for services covered under the Federally qualified health center benefit is not subject to

the usual Part B deductible.

(b) Application of coinsurance. (1) The beneficiary is responsible for a coinsurance amount which cannot exceed 20 percent of the clinic's reasonable customary charge for the covered service; and

(2)(i) The beneficiary's deductible and coinsurance liability, with respect to any one item or service furnished by the rural health clinic, may not exceed a reasonable amount customarily charged by the clinic for that particular item or service.

(ii) For any one item or service furnished by a Federally qualified health center, the coinsurance liability may not exceed 20 percent of a reasonable amount customarily charged by the center for that particular item or service.

§ 405.2418 [Redesignated as § 405.2460]

8. Section 405.2418 is redesignated as § 405.2460 and revised as follows:

§ 405.2460 Applicability of general payment exclusions.

The payment conditions, limitations, and exclusions set out in subpart C of this part, part 410 and part 411 of this chapter are applicable to payment for services provided by rural health clinics and Federally qualified health centers, except that preventive primary services, as defined in § 405.2448, are covered in Federally qualified health centers and not excluded by the provisions of section 1862(a) of the Act.

§ 405.2425 [Redesignated as § 405.2462]

9. Section 405.2425 is redesignated as § 405.2462.

Newly redesignated § 405.2462 is revised to read as follows:

§ 405.2462 Payment for rural health clinic and Federally qualified health center services.

(a) Payment to provider-based rural health clinics and Federally qualified health centers. A rural health clinic or Federally qualified health center is paid in accordance with parts 405 and 413 of this subchapter, as applicable, if:

(1) The clinic or center is an integral and subordinate part of a hospital, skilled nursing facility or home health agency participating in Medicare (i.e., a

provider of services); and

(2) The clinic or center is operated with other departments of the provider

under common licensure, governance and professional supervision.

(b) Payment to independent rural health clinics and freestanding Federally qualified health centers. (1) All other clinics and centers will be paid on the basis of an all-inclusive rate for each beneficiary visit for covered services. This rate will be determined by the intermediary, in accordance with this subpart and general instructions issued by HCFA.

(2) The amount payable by the intermediary for a visit will be determined in accordance with paragraph (b)(3) and (4) of this section.

(3) Federally qualified health centers. For Federally qualified health center visits, Medicare will pay 80 percent of the all-inclusive rate since no deductible is applicable to Federally qualified health center services.

(4) Rural health clinics. (i) If the deductible has been fully met by the beneficiary prior to the rural health clinic visit, Medicare pays 80 percent of

the all-inclusive rate.

(ii) If the deductible has not been fully met by the beneficiary before the visit, and the amount of the clinic's reasonable customary charge for the services that is applied to the deductible is—

(A) Less than the all-inclusive rate, the amount applied to the deductible will be subtracted from the all-inclusive rate and 80 percent of the remainder, if any, will be paid to the clinic;

(B) Equal to or exceeds the allinclusive rate, no payment will be made

to the clinic.

(5) To receive payment, the clinic or center must follow the payment procedures specified in section 410.165 of this chapter.

(6) Payment for treatment of mental psychoneurotic or personality disorders is subject to the limitations on payment in § 410.155(c).

§ 405.2426 [Redesignated as § 405.2464]

10. Section 405.2426 is redesignated as § 405.2464, and is revised to read as follows:

§ 405.2464 All-inclusive rate.

(a) Determination of rate. (1) An allinclusive rate is determined by the intermediary at the beginning of the reporting period.

(2) The rate is determined by dividing the estimated total allowable costs by estimated total visits for rural health clinic or Federally qualified health center services.

(3) The rate determination is subject to any tests of reasonableness that may be established in accordance with this subpart. (b) Adjustment of rate. (1) The intermediary, during each reporting period, periodically reviews the rate to assure that payments approximate actual allowable costs and visits for rural health clinic or Federally qualified health center services and adjusts the rate if:

(i) There is a significant change in the utilization of clinic or center services;

(ii) Actual allowable costs vary materially from the clinic or center's allowable costs; or

(iii) Other circumstances arise which warrant an adjustment.

(2) The clinic or center may request the intermediary to review the rate to determine whether adjustment is required.

§ 405.2427 [Redesignated as § 405.2466]

11. Section 405.2427 is redesignated as § 405.2466 and revised to read as follows:

§ 405.2466 Annual reconciliation.

(a) General. Payments made to a rural health clinic or a Federally qualified health center during a reporting period are subject to reconciliation to assure that those payments do not exceed or fall short of the allowable costs attributable to covered services furnished to Medicare beneficiaries during that period.

(b) Calculation of reconciliation. (1)
The total reimbursement amount due the clinic or center for covered services furnished to Medicare beneficiaries is based on the report specified in § 405.2470(c)(2) and is calculated by the

intermediary as follows:

(i) The average cost per visit is calculated by dividing the total allowable cost incurred for the reporting period by total visits for rural health clinic or Federally qualified health center services furnished during the period. The average cost per visit is subject to tests of reasonableness which may be established in accordance with this subpart.

(ii) The total cost of rural health clinic or Federally qualified health center services furnished to Medicare beneficiaries is calculated by multiplying the average cost per visit by the number of visits for covered rural health clinic or Federally qualified health center services by beneficiaries.

(iii) For rural health clinics, the total reimbursement due the clinic is 80 percent of the amount calculated by subtracting the amount of deductible incurred by beneficiaries that is attributable to rural health clinic services from the cost of these services. The reimbursement computation for

Federally qualified health centers does not include a reduction related to the deductible because Federally qualified health center services are not subject to a deductible.

- (2) The total reimbursement amount due is compared with total payments made to the clinic or center for the reporting period, and the difference constitutes the amount of the reconciliation.
- (c) Notice of program reimbursement. The intermediary sends written notice to the clinic or center:
- (1) Setting forth its determination of the total reimbursement amount due the clinic or center for the reporting period and the amount, if any, of the reconciliation; and

(2) Informing the clinic or center of its right to have the determination reviewed at a hearing under the procedures set forth in subpart R of this part.

- (d) Payment of reconciliation amount—(1) Underpayments. If the total reimbursement due the clinic or center exceeds the payments made for the reporting period, the intermediary makes a lump-sum payment to the clinic or center to bring total payments into agreement with total reimbursement due the clinic or center.
- (2) Overpayments. If the total payments made to a clinic or center for the reporting period exceed the total reimbursement due the clinic or center for the period, the intermediary arranges with the clinic or center for repayment through a lump-sum refund, or, if that poses a hardship for the clinic or center. through offset against subsequent payments or a combination of offset and refund. The repayment must be completed as quickly as possible, generally within 12 months from the date of the notice of program reimbursement. A longer repayment period may be agreed to by the intermediary if the intermediary is satisfied that unusual circumstances exist which warrant a longer period.

§ 405.2428 [Redesignated as § 405.2468]

12. Section 405.2428 is redesignated as § 405.2468. In newly redesignated § 405.2468, paragraphs (a), (b), and (d) are revised to read as follows:

§ 405.2468 Allowable costs.

(a) Applicability of general Medicare principles. In determining whether and to what extent a specific type or item of cost is allowable, such as interest, depreciation, bad debts and owner compensation, the intermediary applies the principles for reimbursement of provider costs, as set forth in Part 413 of this subchapter.

- (b) Typical rural health clinic and Federally qualified health center costs. The following types and items of cost are included in allowable costs to the extent that they are covered and reasonable:
- (1) Compensation for the services of physicians, physician assistants, nurse practitioners, nurse midwives, specialized nurse practitioners, visiting nurses, qualified clinical psychologists, and clinical social workers employed by the clinic or center.
- (2) Compensation for the duties that a supervising physician is required to perform under the agreement specified in § 491.8 of this chapter.
- (3) Costs of services and supplies incident to the services of a physician, physician assistant, nurse practitioner, nurse midwife, specialized nurse practitioner, qualified clinical psychologist, or clinical social worker.
- (4) Overhead costs, including clinic or center administration, costs applicable to use and maintenance of the entity, and depreciation costs.
- (5) Costs of services purchased by the clinic or center.
- (d) Screening guidelines. Costs in excess of amounts established by the guidelines are not included unless the clinic or center provides reasonable justification satisfactory to the intermediary.
- (2) Screening guidelines will be used to assess the costs of services, including:
- (i) Compensation for the professional and supervisory services of physicians and for the services of physician assistants, nurse practitioners, nurse midwives, and specialized nurse practitioners;
- (ii) Services of physicians, physician assistants, nurse practitioners, specialized nurse practitioners, nurse midwives, visiting nurses, qualified clinical psychologists, or clinical social workers;
- (iii) The level of administrative and general expenses;
- (iv) Staffing (e.g., the ratio of other clinic or center personnel to physicians, physician assistants, and nurse practitioners); and
- (v) The reasonableness of payments for services purchased by the clinic or center, subject to the limitation that the costs of physicians' services purchased by the clinic or center may not exceed amounts as determined under the applicable provisions of subpart E of part 405 or part 415.

§ 405.2429 [Redesignated as § 405.2470]

13. Section 405.2429 is redesignated as § 405.2470 and is revised to read as follows:

§ 405.2470 Reports and maintenance of records.

(a) Maintenance and availability of records. The rural health clinic or Federally qualified health center must:

(1) Maintain adequate financial and statistical records, in the form and containing the data required by HCFA, to allow the intermediary to determine payment for covered services furnished to Medicare beneficiaries in accordance with this subpart;

(2) Make the records available for verification and audit by HHS or the General Accounting Office;

(3) Maintain financial data on an accrual basis, unless it is part of a governmental institution that uses a cash basis of accounting. In the latter case, appropriate depreciation on capital assets is allowable rather than the expenditure for the capital asset.

(b) Adequacy of records. (1) The intermediary may suspend reimbursement if it determines that the clinic or center does not maintain records that provide an adequate basis to determine payments under Medicare.

(2) The suspension continues until the clinic or center demonstrates to the intermediary's satisfaction that it does, and will continue to, maintain adequate records.

(c) Reporting requirements—[1] Initial report. At the beginning of its initial reporting period, the clinic or center must submit an estimate of budgeted costs and visits for rural health clinic or Federally qualified health center services for the reporting period, in the form and detail required by HCFA, and such other information as HCFA may require to establish the payment rate.

(2) Annual reports. Within 90 days after the end of its reporting period, the clinic or center must submit, in such form and detail as may be required by HCFA, a report of:

(i) Its operations, including the allowable costs actually incurred for the period and the actual number of visits for rural health clinic or Federally qualified health center services furnished during the period; and

(ii) The estimated costs and visits for rural health clinic services or Federally qualified health center services for the succeeding reporting period and such other information as HCFA may require to establish the payment rate.

(3) Late reports. If the clinic or center does not submit an adequate annual report on time, the intermediary may

reduce or suspend payments to preclude excess payment to the clinic or center.

(4) Inadequate reports. If the clinic or center does not furnish a report or furnishes a report that is inadequate for the intermediary to make a determination of program payment, HCFA may deem all payments for the reporting period to be overpayments.

(5) Postponement of due date. For good cause shown by the clinic or center, the intermediary may, with HCFA's approval, grant a 30-day postponement of the due date for the

annual report.

(6) Reports following termination of agreement or change of ownership. The report from a clinic or center which voluntarily or involuntarily ceases to participate in the Medicare program or experiences a change in ownership (see §§ 405.2436–405.2438) is due no later than 45 days following the effective date of the termination of agreement or change of ownership.

§ 405.2430 [Redesignated as § 405.2472]

14. Section 405.2430 is redesignated as § 405.2472, the undesignated introductory matter is reprinted, and paragraph (a) is revised to read as follows:

§ 405.2472 Beneficiary appeals.

A beneficiary may request a hearing by an intermediary (subject to the limitations and conditions set forth in subpart H of this part) if:

(a) The beneficiary is dissatisfied with an intermediary's determination denying a request for payment made on his or her behalf by a rural health clinic or Federally qualified health center; or

15. In subpart X, an undesignated center heading is added immediately following existing § 405.2417, and new §§ 405.2430 through 405.2452 are added immediately after the undesignated center heading to read as follows:

Federally Qualified Health Center Services

§ 405.2430 Basic requirements.

(a) Filing procedures. (1) In response to a request from an entity that wishes to participate in the Medicare program, HCFA enters into an agreement with an entity when—

(i) PHS recommends that the entity qualifies as a Federally qualified health

center;

(ii) The Federally qualified health center assures HCFA that it meets the Federally qualified health center requirements specified in this subpart and part 491, as described in § 405.2434(a); and

(iii) Any other agreement under Medicare is terminated, except for provider-based entities.

(2) HCFA sends the entity a written notice of the disposition of the request.

(3) When the requirement of paragraph (a)(1) of this section is satisfied, HCFA sends the entity two copies of the agreement. The entity must sign and return both copies of the agreement to HCFA.

(4) If HCFA accepts the agreement filed by the Federally qualified health center, HCFA returns to the center one copy of the agreement with the notice of acceptance specifying the effective date (see § 489.11), as determined under § 405.2434.

(b) Recommendations by PHS about Federally qualified health centers. (1)

An entity must-

(i) Meet the applicable requirements of the PHS Act, as specified in § 405.2401(b); and

(ii) Be recommended by PHS to HCFA as a Federally qualified health center.

(2) The PHS notifies HCFA of entities that meet the requirements specified in

§ 405.2401(b).

(c) Provider-based and freestanding Federally qualified health centers. The requirements and benefits under Medicare for provider-based or freestanding Federally qualified health centers are the same, except that payment methodologies differ, as described in § 405.2462.

(d) Appeals. An entity is entitled to a hearing in accordance with part 498 of this chapter when HCFA fails to enter into an agreement with the entity.

§ 405.2434 Content and terms of the agreement.

Under the agreement, the Federally qualified health center must agree to the following:

(a) Maintain compliance with the requirements. (1) The Federally qualified health center must agree to maintain compliance with the Federally qualified health center requirements set forth in this subpart and part 491, except that the provisions of § 491.3 do not apply.

(2) Centers must promptly report to HCFA any changes that result in noncompliance with any of these

requirements.

(b) Effective date of agreement. (1) Except as specified in paragraph (b)(2) of this section, the effective date of the agreement is the date HCFA accepts the signed agreement, which assures that all Federal requirements are met.

(2) For facilities that met all requirements on October 1, 1991, the effective date of the agreement can be

October 1, 1991.

(c) Charges to beneficiaries. (1) The beneficiary is responsible for payment of a coinsurance amount which is 20 percent of the amount of Part B payment made to the Federally qualified health center for the covered services. There is no coinsurance for a second or third opinion obtained in accordance with section 1164 of the Act or for pneumococcal vaccine and its administration.

(2) The beneficiary is responsible for blood deductible expenses, as specified

in § 410.161.

(3) The Federally qualified health center agrees not to charge the beneficiary (or any other person acting on behalf of a beneficiary) for any Federally qualified health center services for which the beneficiary is entitled to have payment made on his or her behalf by the Medicare program (or for which the beneficiary would have been entitled if the Federally qualified health center had filed a request for payment in accordance with § 410.165 of this chapter), except for coinsurance amounts.

(4) The Federally qualified health center may charge the beneficiary for items and services that are not Federally qualified health center services. However, if the item or service is covered under Part B of Medicare, and the Federally qualified health center agrees to receive Part B payment under the assignment method, the Federally qualified health center may not charge the beneficiary more than 20 percent of the Part B payment.

(d) Refunds to beneficiaries. (1) The Federally qualified health center must agree to refund as promptly as possible any money incorrectly collected from Medicare beneficiaries or from someone

on their behalf.

(2) As used in this section, "money incorrectly collected" means any amount for covered services that is greater than the amount for which the beneficiary was liable because of the coinsurance requirements specified in part 410, subpart E.

(3) Amounts also are considered incorrectly collected if the Federally qualified health center believed the beneficiary was not entitled to Medicare

benefits but-

(i) The beneficiary was later determined to have been so entitled;

(ii) The beneficiary's entitlement period fell within the time the Federally qualified health center's agreement with HCFA was in effect; and

(iii) The amounts exceed the beneficiary's coinsurance liability.

(e) Treatment of beneficiaries. (1) The Federally qualified health center must

agree to accept Medicare beneficiaries

for care and treatment.

(2) The Federally qualified health center may not impose any limitations with respect to care and treatment of Medicare beneficiaries that it does not also impose upon all other persons seeking care and treatment from the Federally qualified health center. Failure to comply with this requirement is a cause for termination of the Federally qualified health center's agreement with HCFA in accordance with § 405.2436(d).

(3) If the Federally qualified health center does not furnish treatment for certain illnesses and conditions to patients who are not Medicare beneficiaries, it need not furnish such treatment to Medicare beneficiaries.

§ 405.2436 Termination of agreement.

(a) Termination by Federally qualified health center. The Federally qualified health center may terminate its agreement by-

(1) Filing with HCFA a written notice stating its intention to terminate the

agreement; and

(2) Notifying HCFA of the date on which the Federally qualified health center requests that the termination take

(b) Effective date. (1) Upon receiving a Federally qualified health center's notice of intention to terminate the agreement, HCFA will set a date upon which the termination takes effect. This effective date may be-

(i) The date proposed by the Federally qualified health center in its notice of intention to terminate, if that date is

acceptable to HCFA; or

(ii) Except as specified in paragraph (2) of this section, a date set by HCFA, which is no later than 6 months after the date HCFA receives the Federally qualified health center's notice of intention to terminate.

(2) The effective date of termination may be less than 6 months following HCFA's receipt of the Federally qualified health center's notice of intention to terminate if HCFA determines that termination on such a date would not-

(i) Unduly disrupt the furnishing of Federally qualified health center services to the community; or

(ii) Otherwise interfere with the effective and efficient administration of the Medicare program.

(3) The termination is effective at the end of the last day of business as a Federally qualified health center.

(c) Termination by HCFA. (1) HCFA may terminate an agreement with a Federally qualified health center if it finds that the Federally qualified health center-

- (i) No longer meets the requirements specified in this subpart; or
- (ii) Is not in substantial compliance
- (A) The provisions of the agreement:
- (B) The requirements of this subpart, any other applicable regulations of this part, or any applicable provisions of title XVIII of the Act.
- (2) Notice by HCFA. HCFA will notify the Federally qualified health center in writing of its intention to terminate an agreement at least 15 days before the effective date stated in the written
- (3) Appeal. A Federally qualified health center may appeal HCFA's decision to terminate the agreement in accordance with part 498 of this chapter.
- (d) Effect of termination. When a Federally qualified health center's agreement is terminated whether by the Federally qualified health center or HCFA, payment will not be available for Federally qualified health center services furnished on or after the effective date of termination.

§ 405.2440 Conditions for reinstatement after termination by HCFA.

When HCFA has terminated an agreement with a Federally qualified health center, HCFA will not enter into another agreement with the Federally qualified health center to participate in the Medicare program unless HCFA-

(a) Finds that the reason for the termination no longer exists; and

(b) Is assured that the reason for the termination of the prior agreement will not recur.

§ 405.2442 Notice to the public.

- (a) When the Federally qualified health center voluntarily terminates the agreement and an effective date is set for the termination, the Federally qualified health center must notify the public prior to a prospective effective date or on the actual day that business ceases, if no prospective date of termination has been set, through publication in at least one newspaper in general circulation in the area serviced by the Federally qualified health center
- (1) Effective date of termination of the provision of services; and
- (2) Effect of termination of the agreement.
- (b) When HCFA terminates the agreement, HCFA will notify the public through publication in at least one newspaper in general circulation in the Federally qualified health center's service area.

§ 405.2444 Change of ownership.

- (a) What constitutes change of ownership-(1) Incorporation. The incorporation of an unincorporated FQHC constitutes change of ownership.
- (2) Merger. The merger of the center corporation into another corporation, or the consolidation of two or more corporations, one of which is the center corporation, resulting in the creation of a new corporation, constitutes a change of ownership. (The merger of another corporation into the center corporation does not constitute change of ownership.)
- (3) Leasing. The lease of all or part of an entity constitutes a change of ownership of the leased portion.
- (b) Notice to HCFA. A center which is contemplating or negotiating change of ownership must notify HCFA.
- (c) Assignment of agreement. When there is a change of ownership as specified in paragraph (a) of this section. the agreement with the existing center is automatically assigned to the new owner if it continues to meet the conditions to be a Federally qualified health center.
- (d) Conditions that apply to assigned agreements. An assigned agreement is subject to all applicable statutes and regulations and to the terms and conditions under which it was originally issued including, but not limited to, the following:
- (1) Compliance with applicable health and safety standards.
- (2) Compliance with the ownership and financial interest disclosure requirements of part 420, subpart C of this subchapter.

§ 405.2446 Scope of services.

- (a) For purposes of this section, the terms rural health clinic and clinic when they appear in the cross references in paragraph (b) of this section also mean Federally qualified health centers.
- (b) Federally qualified health center services that are paid for under this subpart are outpatient services that include-
- (1) Physician services specified in
- (2) Services and supplies furnished as an incident to a physician's professional services as specified in § 405.2413;
- (3) Nurse practitioner or physician assistant services specified in § 405.2414;
- (4) Services and supplies furnished as an incident to a nurse practitioner or physician assistant's services as specified in § 405.2415;

(5) Clinical psychologist and clinical social worker services specified in

§ 405.2450;

(6) Services and supplies furnished as an incident to a clinical psychologist or clinical social worker's services as specified in § 405.2452;

(7) Visiting nurse services specified in

§ 405.2416; and

(8) Preventive services specified in

§ 405.2448 of this subpart.

(c) Federally qualified health center services are covered when provided in outpatient settings only, including a patient's place of residence, which may be a skilled nursing facility or a nursing facility or other institution used as a patient's home.

(d) Federally qualified health center services are not covered in a hospital, as defined in section 1861(e) (1) of the Act.

§ 405.2448 Preventive primary services.

(a) Preventive primary service are those health services that-

(1) A center is required to provide as preventive primary health services under section 329, 330, and 340 of the

Public Health Service Act;

(2) Are furnished by or under the direct supervision of a nurse practitioner, physician assistant, nurse midwife, specialized nurse practitioner, clinical psychologist, clinical social worker, or a physician;

(3) In the case of a service, are furnished by a member of the center's health care staff who is an employee of the center or by a physician under arrangements with the center; and

(4) Except as specifically provided in section 1861(s) of the Act, include only drugs and biologicals that cannot be self-administered.

(b) Preventive primary services which may be paid for when provided by Federally qualified health centers are the following:

(1) Medical social services;

- (2) Nutritional assessment and referral;
 - (3) Preventive health education;
- (4) Children's eye and ear examinations;
 - (5) Prenatal and post-partum care;

(6) Prenatal services;

- (7) Well child care, including periodic
- (8) Immunizations, including tetanusdiptheria booster and influenza vaccine;

(9) Voluntary family planning services;

- (10) Taking patient history;
- (11) Blood pressure measurement;

(12) Weight;

- (13) Physical examination targeted to risk;
 - (14) Visual acuity screening;
 - (15) Hearing screening;

(16) Cholesterol screening;

(17) Stool testing for occult blood;

(18) Dipstick urinalysis;

(19) Risk assessment and initial counseling regarding risks; and

(20) For women only: (i) Clinical breast exam;

(ii) Referral for mammography; and

(iii) Thyroid function test.

(c) Preventive primary services do not include group or mass information programs, health education classes, or group education activities, including media productions and publications.

(d) Screening mammography is not considered a Federally qualified health center service, but may be provided at a Federally qualified health center if the center meets the requirements applicable to that service specified in § 410.34 of this subchapter. Payment is made under applicable Medicare requirements.

(e) Preventive primary services do not include eyeglasses, hearing aids, or preventive dental services.

§ 405.2450 Clinical psychologist and clinical social worker services.

(a) For clinical psychologist or clinical social worker professional services to be reimbursable under this subpart, the services must be-

(1) Furnished by an individual who is employed by or receives compensation from the Federally qualified health

(2) Of a type that the clinical psychologist or clinical social worker who furnishes the services is legally permitted to perform by the State in which the service is furnished;

(3) Performed by a clinical social worker or clinical psychologist who is legally authorized to perform such services under State law or the State regulatory mechanism provided by the law of the State in which such services are performed; and

(4) Covered if furnished by a physician.

(b) If State law prescribes a physician supervision requirement, it is met if the conditions specified in § 491.8(b) of this chapter and any pertinent requirements of State law are satisfied.

(c) The services of clinical psychologists or clinical social workers are not covered if State law or regulations require that the services be performed under a physician's order and no such order was prepared.

§ 405.2452 Services and supplies incident to clinical psychologist and clinical social worker services.

(a) Services and supplies incident to a clinical psychologist's or clinical social worker's services are reimbursable

under this subpart if the service or supply is-

(1) Of a type commonly furnished in a physician's office;

(2) Of a type commonly furnished either without charge or included in the Federally qualified health center's bill;

(3) Furnished as an incidental, although integral part of professional services furnished by a clinical psychologist or clinical social worker;

(4) Furnished under the direct, personal supervision of a clinical psychologist, clinical social worker or physician; and

(5) In the case of a service, furnished by a member of the center's health care staff who is an employee of the center.

(b) The direct personal supervision requirement in paragraph (a)(4) of this section is met only if the clinical psychologist or clinical social worker is permitted to supervise such services under the written policies governing the Federally qualified health center.

16. In subpart X, an undesignated center heading is added immediately following new § 405.2452 to read as

follows:

Payment for Rural Health Clinic and Federally Qualified Health Center Services

C. Part 407 is amended as follows:

PART 407—SUPPLEMENTARY **MEDICAL INSURANCE (SMI) ENROLLMENT AND ENTITLEMENT**

1. The authority citation for part 407 continues to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh) unless otherwise noted.

2. Section 407.2 is revised to read as follows:

Subpart A-General Provisions

§ 407.2 General description of program.

Part B of Title XVIII of the Act provides for voluntary "supplementary medical insurance" available to most individuals age 65 or over and to disabled individuals who are under age 65 and entitled to hospital insurance. The SMI program is financed by premiums paid by (or for) each individual enrolled in the program, plus contributions from Federal funds. It covers certain physicians' services, outpatient services, home health services, services furnished by rural health clinics (RHCs), Federally qualified health centers (FQHCS), ambulatory surgical centers (ASCs), and comprehensive outpatient rehabilitation facilities (CORFs), and other medical and other health services.

D. Part 410 is amended as follows:

PART 410-SUPPLEMENTARY MEDICAL INSURANCE (SMI) BENEFITS

1. The authority citation for part 410 is revised to read as follows:

Authority: Secs. 1102, 1832, 1833, 1834, 1835, 1861(r), (s) and (cc), 1861(aa), 1871, and 1881 of the Social Security Act (42 U.S.C. 1302, 1395k, 1395l, 1395m, 1395n, 1395x(r), (s) and (cc), 1395x(aa), 1395hh, and 1395rr).

2. Section 410.3(a)(1) is revised to read as follows:

§ 410.3 Scope of benefits.

(a) Covered services. The SMI program helps pay for the following:

(1) Medical and other health services such as physicians' services, outpatient hospital services, diagnostic tests, outpatient physical therapy and speech pathology services, rural health clinic services, Federally qualified health center services, and outpatient renal dialysis services.

(2) * * * (3) * * * * *

* * 3. Section 410.5(b) is revised to read as follows:

§ 410.5 Other applicable rules.

. (b) Part 405, Subpart X: Rural Health Clinic and Federally Qualified Health Center services.

4. Section 410.10 is amended by adding a new paragraph (s) to read as

§ 410.10 Medical and other health services: Included services.

Subject to the conditions and limitations specified in this subpart, medical and other health services includes the following services: . . .

(s) Federally qualified health center services.

5. Section 410.32 is amended by adding a new paragraph (b)(6) and reprinting the introductory language to read as follows:

§ 410.32 Diagnostic X-ray tests, diagnostic laboratory tests, and other diagnostic tests: Conditions.

(b) Diagnostic laboratory tests. Medicare Part B pays for covered diagnostic laboratory tests that are

(1) * * * (2) * * *

(3) * * *

(4) * * *

furnished by any of the following:

(6) A Federally qualified health center.

6. Section 419.150 is amended by revising paragraph (b) (8) to read as follows:

§ 410.150 To whom payment is made. * *

(b) Specific rules. * * * . . .

(8) To a rural health clinic or Federally qualified health center on the individual's behalf for rural health clinic or Federally qualified health center services furnished by the rural health clinic or Federally qualified health center, respectively.

7. Section 410.152 is amended by revising paragraphs (f), (h), and the heading of (j) to read as follows:

§ 410.152 Amounts of payment.

(f) Amount of payment: Rural health clinic and Federally qualified health center services. Medicare Part B pays, for services by a participating independent rural health clinic or Federally qualified health center, 80 percent of the costs determined under subpart X of part 405 of this chapter, to the extent those costs are reasonable and related to the cost of furnishing rural health clinic or Federally qualified health center services or reasonable on the basis of other tests specified by

(h) Amount of payment: Pneumococcal vaccine. Medicare Part B pays for pneumococcal vaccine and its administration as follows:

(1) For services furnished by a nominal charge provider, 100 percent of fair compensation.

(2) For services furnished by a provider that is not a nominal charge provider, the reasonable cost of the services or the customary charge for the service, whichever is less.

(3) For services furnished by other than a provider, a rural health clinic or a Federally qualified health center, 100 percent of the reasonable charge.

(4) For services furnished by a rural health clinic or a Federally qualified health center, 100 percent of the reasonable cost.

(j) Amount of payment: services of Federally funded health facilities prior to October 1, 1991. * * *

8. Section 410.160(b) is revised to read as follows:

§ 410.160 Part B annual deductible. *

(b) Exceptions. Expenses incurred for the following services are not subject to the Part B annual deductible and do not count toward meeting that deductible:

(1) Home health services.

(2) Pneumococcal vaccines and their administration.

(3) Federally qualified health center services.

(4) ASC facility services furnished before July 1987 and physician services furnished before April 1988 that met the requirements for payment of 100 percent of the reasonable charges.

9. Section 410.165(a) is revised to read as follows:

§ 410.165 Payment for rural health clinic services and ambulatory surgical center services: Conditions.

(a) Medicare Part B pays for covered rural health clinic and Federally qualified health center services if-

(1) The services are furnished in accordance with the requirements of subpart X of part 405 of this chapter and subpart A of part 491 of this chapter; and

(2) The clinic or center files a written request for payment on the form and in the manner prescribed by HCFA.

E. Part 417 is amended as follows:

PART 417—HEALTH MAINTENANCE ORGANIZATIONS, COMPETITIVE MEDICAL PLANS, AND HEALTH CARE PREPAYMENT PLANS

1. The authority citation for part 417 is revised to read as follows:

Authority: Secs. 1102, 1833(a)(1)(A). 1861(s)(2)(H), 1861(aa), 1871, 1874, and 1876 of the Social Security Act (42 U.S.C. 1302, 13951(a)(1)(A), 1395x(s)(2)(H), 1395x(aa), 1395hh, 1395kk, and 1395mm); section 114(c) of Pub.L. 97-248 (42 U.S.C. 1395mm note); section 9312(c) of Pub. L. 99-509 (42 U.S.C. 1395mm note); and section 1301 of the Public Health Service Act (42 U.S.C. 300e) and 31 U.S.C. 9701.

2. Section 417.416(d)(1) is revised to read as follows:

Subpart C-Health Maintenance Organizations and Competitive Medical Plans

§ 417.416(d) Qualifying condition: Furnishing of services. * * *

(d) Exceptions to physician supervision. * *

(1) The organization may permit the services of physician assistants and nurse practitioners (as defined in § 491.2 of this chapter), and the services and supplies incident to their services, to be furnished without the direct personal supervision of a physician. For purposes

of this section, the definitions of physician assistants' and nurse practitioners' services and the services and supplies incident to their services for rural health clinics and Federally qualified health centers as specified in §§ 405.2414 and 405.2415 of this chapter are applicable.

(2) * . .

F. Part 420 is amended as follows:

PART 420-PROGRAM INTEGRITY: MEDICARE

1. The authority citation for part 420 is revised to read as follows:

Authority: Secs. 1102, 1124, 1126, 1861(as), 1866, and 1871, of the Social Security Act (42 U.S.C. 1302, 1320a-3, 1320a-5, 1395x(aa), 1395cc, and 1395hh).

2. Section 420.201 is amended by revising the definition of disclosing entity and reprinting the introductory language to read as follows:

Subpart C-Disclosure of Information

§ 420.201 Definitions.

As used in this subpart unless the context indicates otherwise:

Disclosing entity means:

(1) A provider of services, an independent clinical laboratory, a renal disease facility, a rural health clinic, a Federally qualified health center, or a health maintenance organization (as defined in section 1301(a) of the Public Health Service Act); and

(2) A carrier or other agency or organization that is acting as a fiscal intermediary or agent for one or more providers of services for purposes of Part A or Part B of Medicare.

. . .

G. Part 424 is amended as follows:

PART 424—CONDITIONS FOR **MEDICARE PAYMENT**

1. The authority citation for part 424 continues to read as follows:

Authority: Secs. 216(j), 1102, 1814, 1815(c), 1835, 1842(b), 1861, 1866(d), 1870(e) and (f), 1871 and 1872 of the Social Security Act (42 U.S.C. 416(j), 1302, 1395f, 1395g(c), 1395n, 1395u(b), 1395x, 1395cc(d), 1395gg(e) and (f), 1395hh and 1395ii).

2. Section 424.1(c) is revised to read as follows:

Subpart A-General Provisions

§ 424.1 Basis and scope. . .

(c) Other applicable rules. Except for § 424.40(c)(3), this part does not deal with the conditions for payment of rural health clinic (RHC) services, Federally qualified health center (FQHC) services, or ambulatory surgical center (ASC) services. Those conditions are set forth in part 405, subpart X, and part 481 subpart A of this chapter for RHC and FQHC services; and in part 416 of this chapter, for ASC services. The rules for physician certification of terminal illness, required in connection with hospice care, are set forth in § 418.22 of this chapter.

2. Section 424.40(c)(3) is revised to read as follows:

Subpart C-Claims for Payment

§ 424.40 Request for payment effective for more than one claim.

(c) Signed statement in the provider record-

(1) * * *

(2) * * *

(3) Services to outpatients: Independent rural health clinics and Federally qualified health centers. A signed request for payment statement retained in the clinic's or center's files may be effective indefinitely for all claims for services furnished to that beneficiary by the clinic.

H. Part 488 is amended as follows:

PART 488-SURVEY AND **CERTIFICATION PROCEDURES**

1. The authority citation is revised to read as follows:

Authority: Secs. 1102, 1814, 1861, 1865, 1866, 1871, 1880, 1881, 1883, 1913 of the Social Security Act (42 U.S.C. 1302, 1395f, 1395x, 1395bb, 1395cc, 1395hh, 1395qq, 1395rr and

2. Section 488.1 is amended be revising the definition of "supplier" and reprinting the introductory language to read as follows:

Subpart A—General Provisions

§ 488.1 Definitions.

As used in this party-.

Supplier means any of the following: Independent laboratory; portable X-ray services physical therapist in independent practice; ESRD facility; rural health clinic; Federally qualified health center; or chiropractor.

I. Part 491 is amended as follows:

PART 491—CERTIFICATION OF CERTAIN HEALTH FACILITIES

1. The authority citation for part 491 continues to read as follows:

Authority: Sec. 1102 of the Social Security Act (42 U.S.C. 1302).

2. Part 491 is amended by revising the title of subpart A to read as follows:

Subpart A-Rural Health Clinics: Conditions for Certification; and **Federally Qualified Health Centers** Conditions for Coverage

3. Section 491.1 is revised to read as follows:

§ 491.1 Purpose and scope.

This subpart sets forth the conditions that rural health clinics or Federally qualified health centers must meet in order to qualify for reimbursement under Medicare (Title XVIII of the Social Security Act) and that rural health clinics must meet in order to qualify for reimbursement under Medicaid (Title XIX of the Act).

4. Section 491.2 is amended by removing the lower case letter designations before each definition, reprinting the introductory language, and adding a new definition of Federally qualified health center to read as follows:

§ 491.2 Definitions.

As used in this subpart, unless the context indicates otherwise: * * *

Federally qualified health center means an entity as defined in § 405.2401(b).

5. Section 491.4 revised to read as follows:

§ 491.4 Compilance with Federal, State and local laws.

The rural health clinic or Federally qualified health center and its staff are in compliance with applicable Federal, State and local laws and regulations.

(a) Licensure of clinic or center. The clinic or center is licensed pursuant to applicable State and local law.

(b) Licensure, certification or registration of personnel. Staff of the clinic or center are licensed, certified or registered in accordance with applicable State and local laws.

6. Section 491.5(a) is revised to read as follows:

§ 491.5 Location of clinic or center.

- (a) Basic requirement. The clinic is located in a rural area that is designated as a shortage area. The Federally qualified health center is located in a rural or urban area that is designated as a shortage area. Both the clinic and the center may be permanent or mobile
- (1) Permanent unit. The objects, equipment and supplies necessary for the provision of the services furnished

directly by the clinic or center are housed in a permanent structure.

(2) Mobile unit. The objects, equipment, and supplies necessary for the provision of the services furnished directly by the clinic or center are housed in a mobile structure which has fixed, scheduled location(s).

Under this requirement, if clinic services are furnished at permanent units in more than one location, each unit will be independently considered for certification as a rural health clinic or for coverage as a Federally qualified health center.

Section 491.6 is revised to read as follows:

§ 491.6 Physical plant and environment.

- (a) Construction. The clinic or center is constructed, arranged, and maintained to insure access to and safety of patients, and provides adequate space for the provision of direct services.
- (b) Maintenance. The clinic or center has a preventive maintenance program to ensure that:
- (1) All essential mechanical, electrical and patient-care equipment is maintained in safe operating condition:

(2) Drugs and biologicals are appropriately stored; and

(3) The premises are clean and orderly.

(c) Emergency procedures. The clinic or center assures the safety of patients in case of non-medical emergencies by:

(1) Training staff in handling emergencies:

(2) Placing exit signs in appropriate locations; and

(3) Taking other appropriate measures that are consistent with the particular conditions of the area in which the clinic or center is located.

8. Section 491.7 is revised to read as follows:

§ 491.7 Organizational structure.

(a) Basic requirements. (1) The clinic or center is under the medical direction of a physician, and has a health care staff that meets the requirements of § 491.8.

(2) The organization's policies and its lines of authority and responsibilities are clearly set forth in writing.

(b) Disclosure. The clinic or center discloses the names and addresses of:

(1) Its owners, in accordance with section 1124 of the Social Security Act (42 U.S.C. 132 A-3);

(2) The person principally responsible for directing the operation of the clinic or center; and

(3) The person responsible for medical direction. 9. Section 491.8 is revised to read as follows:

§ 491.8 Staffing and staff responsibilities.

(a) Staffing. (1) The clinic or center has a health care staff that includes one or more physicians. Rural health clinic staffs must also include one or more physician's assistants or nurse practitioners.

(2) The physician member of the staff may be the owner of the rural health clinic, an employee of the clinic or center, or under agreement with the clinic or center to carry out the responsibilities required under this section

(3) The physician's assistant or nurse practitioner member of the staff may be the owner of the rural health clinic or an employee of the clinic or center.

(4) The staff may also include ancillary personnel who are supervised by the professional staff.

(5) The staff is sufficient to provide the services essential to the operation of the clinic or center.

(6) A physician, nurse practitioner, or physician assistant is available to furnish patient care services at all times the clinic or center operates. In addition, for rural health clinics, a nurse practitioner or a physician assistant is available to furnish patient care services at least 60 percent of the time the clinic operates.

(b) Physician responsibilities. (1) The physician:

(i) Provides medical direction for the clinic's or center's health care activities and consultation for, and medical supervision of, the health care staff.

(ii) In conjunction with the physician's assistant and/or nurse practitioner member(s), participates in developing, executing, and periodically reviewing the clinic's or center's written policies and the services provided to Federal program patients; and

(iii) Periodically reviews the clinic's or center's patient records, provides medical orders, and provides medical care services to the patients of the clinic or center.

(2) A physician is present for sufficient periods of time, at least once in every 2 week period (except in extraordinary circumstances), to provide the medical direction, medical care services, consultation and supervision described in paragraph (b)(1) of this section and is available through direct telecommunication for consultation, assistance with medical emergencies, or patient referral. The extraordinary circumstances are documented in the records of the clinic or center.

(c) Physician assistant and nurse practitioner responsibilities. (1) The

physician assistant and the nurse practitioner members of the clinic's or center's staff:

- (i) Participate in the development, execution and periodic review of the written policies governing the services the clinic or center furnishes;
- (ii) Participate with a physician in a periodic review of the patients' health records.
- (2) The physician assistant or nurse practitioner performs the following functions, to the extent they are not being performed by a physician:

(i) Provides services in accordance with the clinic's or center's policies;

- (ii) Arranges for, or refers patients to, needed services that cannot be provided at the clinic or center; and
- (iii) Assures that adequate patient health records are maintained and transferred as required when patients are referred.
- 10. Section 491.9 is revised to read as follows:

§ 491.9 Provision of services.

- (a) Basic requirements. (1) All services offered by the clinic or center are furnished in accordance with applicable Federal, State, and local laws; and
- (2) The clinic or center is primarily engaged in providing outpatient health services and meets all other conditions of this subpart.

(3) The laboratory requirements in paragraph (c)(2) of this section apply to RHCs, but do not apply to FQHCs.

(b) Patient care policies. (1) The clinic's or center's health care services are furnished in accordance with appropriate written policies which are consistent with applicable State law.

(2) The policies are developed with the advice of a group of professional personnel that includes one or more physicians and one or more physician assistants or nurse practitioners. At least one member is not a member of the clinic or center staff.

(3) The policies include:

 (i) A description of the services the clinic or center furnishes directly and those furnished through agreement or arrangement.

(ii) Guidelines for the medical management of health problems which include the conditions requiring medical consultation and/or patient referral, the maintenance of health care records, and procedures for the periodic review and evaluation of the services furnished by the clinic or center.

(iii) Rules for the storage, handling, and administration of drugs and biologicals.

- (4) These policies are reviewed at least annually by the group of professional personnel required under paragraph (b)(2) of this section and reviewed as necessary by the clinic or center.
- (c) Direct services—(1) General. The clinic or center staff furnishes those diagnostic and therapeutic services and supplies that are commonly furnished in a physician's office or at the entry point into the health care delivery system. These include medical history, physical examination, assessment of health status, and treatment for a variety of medical conditions.
- (2) Laboratory. These requirements apply to RHCs, but not to FQHCs. The RHC provides basic laboratory services essential to the immediate diagnosis and treatment of the patient, including:

(i) Chemical examinations of urine by stick or tablet methods or both (including urine ketones);

- (ii) Microscopic examinations of urine sediment;
 - (iii) Hemoglobin or hematocrit;
 - (iv) Blood sugar;
 - (v) Gram stain;
- (vi) Examination of stool specimens for occult blood;
 - (vii) Pregnancy tests;
- (viii) Primary culturing for transmittal to a certified laboratory; and
 - (ix) Test for pinworm.
- (3) Emergency. The clinic or center provides medical emergency procedures as a first response to common lifethreatening injuries and acute illness and has available the drugs and biologicals commonly used in life saving procedures, such as analgesics, anesthetics (local), antibiotics, anticonvulsants, antidotes and emetics, serums and toxoids.
- (d) Services provided through agreements or arrangements. (1) The clinic or center has agreements or arrangements with one or more providers or suppliers participating under Medicare or Medicaid to furnish other services to its patients, including:
 - (i) Inpatient hospital care;
- (ii) Physician(s) services (whether furnished in the hospital, the office, the patient's home, a skilled nursing facility, or elsewhere); and
- (iii) Additional and specialized diagnostic and laboratory services that are not available at the clinic or center.
- (2) If the agreements are not in writing, there is evidence that patients referred by the clinic or center are being accepted and treated.
- 11. Section 491.10 is amended by revising paragraphs (a) and (b) to read as follows:

§ 491.10 Patient health records.

(a) Records system. (1) The clinic or center maintains a clinical record system in accordance with written policies and procedures.

(2) A designated member of the professional staff is responsible for maintaining the records and for insuring that they are completely and accurately documented, readily accessible, and systematically organized.

(3) For each patient receiving health care services, the clinic or center maintains a record that includes, as

applicable:

(i) Identification and social data, evidence of consent forms, pertinent medical history, assessment of the health status and health care needs of the patient, and a brief summary of the episode, disposition, and instructions to the patient;

 (ii) Reports of physical examinations, diagnostic and laboratory test results,

and consultative findings;

(iii) All physician's orders, reports of treatments and medications, and other pertinent information necessary to monitor the patient's progress;

(iv) Signatures of the physician or other health care professional.

(b) Protection of record information.
(1) The clinic or center maintains the confidentiality of record information and provides safeguards against loss, destruction or unauthorized use.

(2) Written policies and procedures govern the use and removal of records from the clinic or center and the conditions for release of information.

(3) The patient's written consent is required for release of information not authorized to be released without such consent.

12. Section 491.11 is revised to read as follows:

§ 491.11 Program evaluation.

(a) The clinic or center carries out, or arranges for, an annual evaluation of its total program.

(b) The evaluation includes review of:

- (1) The utilization of clinic or center services, including at least the number of patients served and the volume of services:
- (2) A representative sample of both active and closed clinical records; and
- (3) The clinic's or center's health care policies.
- (c) The purpose of the evaluation is to determine whether:
- (1) The utilization of services was appropriate;
- (2) The established policies were followed; and
 - (3) Any changes are needed.

- (d) The clinic or center staff considers the findings of the evaluation and takes corrective action if necessary.
 - J. Part 498 is amended as follows;

PART 498—APPEALS PROCEDURES FOR DETERMINATIONS THAT AFFECT PARTICIPATION IN THE MEDICARE PROGRAM

1. The authority citation for part 498 is revised to read as follows:

Authority: Secs. 205(a), 1102, 1861(aa), 1869(c), 1871, and 1872 of the Social Security Act (42 U.S.C. 405(a), 1302, 1395x(aa), 1395ff(c), 1395hh and 1395ii), unless otherwise noted.

2. Section 498.2 is amended by revising the definition of "supplier" and reprinting the introductory language to read as follows:

Subpart A—General Provisions

§ 498.2 Definitions.

As used in this part—

Supplier means an independent laboratory, supplier of portable X-ray services, rural health clinic (RHC), Federal qualified health center (FQHC), ambulatory surgical center (ASC), organ procurement organization (OPO), or end-stage renal disease (ESRD) treatment facility that is approved by HCFA as meeting the conditions for coverage of its services, and

3. Section 498.3(b)(7) is revised to read as follow:

§ 498.3 Scope and applicability.

- (b) Initial determinations by HCFA.
- (7) the termination of a provider agreement in accordance with § 489.53 of this chapter, or the termination of a rural heath clinic agreement in accordance with § 405.2404 this chapter or the termination of a Federally qualified health center agreement in accordance with § 405.2440.

(Catalog of Federal Domestic Assistance Program No. 93.774, Medicare— Supplementary Medical Insurance Program)

Dated: March 18, 1992.

J. Michael Hudson,

Acting Administrator, Health Care Financing Administration.

Approved: March 19, 1992.

BILLING CODE 4120-01-M

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

43 CFR Public Land Order

[AK-932-4214-10; F-14223]

Modification of Public Land Order No. 5150, as Amended, for Selection of Lands by the State of Alaska; AK

AGENCY: Bureau of Land Management, Interior.

ACTION: Public Land Order.

SUMMARY: This order modifies a public land order insofar as it affects approximately 676,987 acres of public lands withdrawn for use as a utility and transportation corridor. This action also classifies as suitable for and opens the lands to selection by the State of Alaska, if such lands are otherwise available. Any lands described herein that are not conveyed to the State will be subject to the terms and conditions of Public Land Order No. 5150, as amended. This order does not otherwise change the provisions or limitations of Public Land Order Nos. 5150 and 5180, as amended, or any other withdrawal of record. Public Land Order No. 5150 was made pursuant to sections 17(c) and 17(d) of the Alaska Native Claims Settlement Act, 43 U.S.C. 1616(c) and 1616(d), the authority vested in the President, and Executive Order No. 10355 of May 26, 1952 (17 FR 4831). The lands described below as the Coldfoot Unit, Sagavanirktok Unit, and Gas Arctic Unit lie north and west of the Porcupine-Yukon-Kuskokwim line described in section 10 of the Alaska Statehood Act of July 7, 1958, 48 U.S.C. note prec. 21 (1988). Selection of these lands is subject to the approval of the Secretary of the Interior and the Secretary of Defense pursuant to section 6(b) of the Alaska Statehood Act and Executive Order No. 10950 of June 27, 1961. This classification meets the requirement of section 6(b) of the Alaska Statehood Act and Section 906(p) of the Alaska National Interest Lands Conservation Act, 43 U.S.C. 1635(p) (1988).

EFFECTIVE DATE: June 12, 1992.

FOR FURTHER INFORMATION CONTACT: Sandra C. Thomas, BLM Alaska State Office, 222 W. 7th Avenue, No. 13, Anchorage, Alaska 99513–7599, 907–271– 5477.

By virtue of the authority vested in the Secretary of the Interior by sections 17(c), 17(d)(1), and 22(h)(4) of the Alaska Native Claims Settlement Act; 43 U.S.C. 1616(c), 1616(d)(1), and 1621(h)(4) (1988); and by section 204 of the Federal Land Policy and Management Act of 1976, 43

U.S.C. 1714 (1988), it is ordered as follows:

1. Public Land Order No. 5150, as amended, which withdrew public lands for use as a utility and transportation corridor, is hereby modified to allow State selection insofar as it affects the following described lands:

Fairbanks Meridian (Partly Surveyed)

South of the Yukon River Unit

T. 10 N., R. 9 W.,

Secs. 5 to 8, excluding those lands south of the right bank of Hess Creek.

T. 11, N., R. 10 W.,

Secs. 4 to 9, inclusive; Secs. 14 to 36, inclusive.

5ecs. 14 to 36, inclus

T. 12 N., R. 11 W.,

Secs, 19 to 22, excluding those lands north of the right bank of the Yukon River; Secs. 27 and 28;

Secs. 29, 30, and 31, excluding those lands north of the right bank of the Yukon

Secs. 32 to 36, inclusive.

The South of the Yukon River Unit area as described contains approximately 28,551 acres.

Fairbanks Meridian (Unsurveyed)

Coldfoot Unit

T. 28, N., R. 12 W.,

Sec. 3;

Secs. 4 and 9, excluding those lands west of the left bank of the Middle Fork Koyukuk River;

Sec. 10:

Secs. 15 and 16, excluding those lands west of the left bank of the Middle Fork Koyukuk River, and excluding three parcels as described below:

Parcel 1

A parcel of land lying within the W½ of sec. 15, and the E½ of sec. 16, the Point of Beginning being the intersection of the centerline of the Dalton Highway and the centerline of the Venetic Trail; Thence, N. 75° W., approximately 180 feet to corner No. 1; Thence, N. 40° E., approximately 570 feet to corner No. 2; Thence, N. 18°30′ W., approximately 480 feet to corner No. 3; Thence, S. 49°30′ W., approximately 1,020 feet to corner No. 4; Thence, S. 60° E., approximately 330 feet to corner No. 5; Thence, S. 75° E., approximately 300 feet to close at corner No. 3.

This parcel contains approximately 8.80 acres.

Parcel 2

A parcel of land lying within the W½ of sec. 15, and the E½ of sec. 16, the Point of Beginning being the intersection of the centerline of the Dalton Highway and the centerline of the Venetie Trail; Thence, S. 89° W., approximately 210 feet to corner No. 1; Thence, N. 75° W., approximately 270 feet to corner No. 2; Thence, N. 60° W., approximately 360 feet to corner No. 3; Thence, S. 49°30′ W., approximately 840 feet to corner No. 4; Thence, S. 60° E., approximately 810 feet to corner No. 5; Thence, N. 40° E., approximately 900 feet to close at corner No. 1.

This parcel contains approximately 15 acres.

Parcel 3

A parcel of land lying within the W½ of sec. 15, the Point of Beginning being the intersection of the centerline of the Dalton Highway and the centerline of the Venetie Trail; Thence, S. 77° E., approximately 100 feet to corner No. 1; Thence, continuing S. 77° E., approximately 750 feet to corner No. 2; Thence, N. 40° E., approximately 380 feet to corner No. 3; Thence, N. 77° W., approximately 750 feet to corner No. 4; Thence, S. 40° W., approximately 360 feet to close at corner No. 1.

This parcel contains approximately 4.60 acres.

Secs. 17 and 20, excluding those lands west of the left bank of the Middle Fork Koyukuk River;

Secs. 21 and 22.

T. 29 N., R. 12W.,

Secs. 23, 24, and 26, excluding those lands west of the left bank of the Middle Fork Koyukuk River, and excluding two parcels are described below:

Parcel 1

A parcel of land lying within the E1/2 of sec. 23, and the W 1/2 of sec. 24, the Point of Beginning being the intersection of the centerline of the Dalton Highway and the middle of the channel of Marion Creek within sec. 23; Thence, N. 61°30' E., approximately 875 feet to corner No. 1; Thence, S. 69°06' E., approximately 344 feet to corner No. 2; Thence, S. 23°50' E., approximately 429 feet to corner No. 3; Thence, S. 62°07' E., approximately 306 feet to corner No. 4; Thence, S. 75°27' E., approximately 704 feet to corner No. 5; Thence, S. 66°11' E., approximately 795 feet to corner No. 8; Thence, S. 23°48' E., approximately 480 feet to corner No. 7; Thence, N. 66°11' W. approximately 465 feet to corner No. 8; Thence, N. 54"31' W., approximately 1,800 feet to corner No. 9; Thence, S.4 36°21' W., approximately 696 feet to close at corner No.

This parcel contains approximately 35

Parcel 2

A parcel of land lying within the S½ of sec. 23, and the N½ of sec. 26, the Point of Beginning being the intersection of the centerline of the Dalton Highway and the middle of the channel of Marion Creek within sec. 23; Thence, S. 13°30′ W., approximately 1,020 feet to corner No. 1; Thence, S. 40°30′ E., approximately 600 feet to corner No. 2; Thence, S. 23° E., approximately 200 feet to corner No. 3; Thence, S. 70° E., approximately 900 feet to corner No. 4; Thence, N. 20°30′ E., approximately 1,150 feet to corner No. 5; Thence, N. 70° W., approximately 1,580 feet to corner No. 6; Thence, S. 19° W., approximately 720 feet to close at corner No. 1

This parcel contains approximately 36.60 acres.

Sec. 25, N1/2;

Secs. 27, 34 and 35, excluding those lands west of the left bank of the Middle Fork Koyukuk River. The Coldfoot Unit area as described contains approximately 7,289 acres.

Umiat Meridian (Unsurveyed)

Sagavanirktok Unit

Tps. 1 N., Rs. 13, 14, and 14 E. Tps. 1 to 7 S., Rs. 13, 14, and 15 E.

Tps. 8 S., Rs. 12, 13, and 14 E.

The Sagavanirktok Unit area as described contains approximately 671,616 acres.

Umiat Meridian (Unsurveyed)

Gas Arctic Unit

T. 1 S., R. 24 E.,

Secs. 1 to 18 inclusive.

T. 1 S., R. 25 E.,

Sec. 4, excluding lands within the Arctic National Wildlife Refuge;

Secs. 5 to 9, inclusive;

Secs. 10, 14, and 15, excluding lands within the Arctic National Wildlife Refuge;

Secs. 16 to 21, inclusive;

Secs. 22 and 27, excluding lands within the Arctic National Wildlife Refuge;

Secs. 28 to 33, inclusive;

Sec. 34, excluding lands within the Arctic National Wildlife Refuge.

The Gas Arctic Unit area as described contains approximately 25,531 acres.

The areas described aggregate a total of approximately 676,987 acres.

- 2. Subject to valid existing rights, the lands described above are hereby classified as suitable for and opened to selection by the State of Alaska under either the Alaska Statehood Act of July 7, 1958, 48 U.S.C. note prec. 21 (1988), or section 906(b) of the Alaska National Interest Lands Conservation Act, 43 U.S.C. 1635(b) (1988).
- 3. The filing of selections by the State of Alaska has been approved by the Secretary of the Interior and the Secretary of Defense pursuant to section 6(b) of the Alaska Statehood Act. The State of Alaska applications for selection made under section 906(e) of the Alaska National Interest Lands Conservation Act, 43 U.S.C. 1635(e) (1988), become effective without further action by the State upon publication of this public land order in the Federal Register, if such lands are otherwise available. Lands not conveyed to the State will be subject to the terms and conditions of Public Land Order No. 5105, as amended.
- 4. This order does not change any provisions or limitations of Public Land Order Nos. 5150 and 5180, as amended, or any other withdrawal of record except as expressly provided above.

Dated: June 9, 1992.

Dave O'Neal,

Assistant Secretary of the Interior.

FEDERAL COMMUNICATIONS COMMISSION

47 CFR part 1

[FCC 92-212]

Standards for Assessing Forfeitures

AGENCY: Federal Communications Commission.

ACTION: Policy Statement.

SUMMARY: By this action, the Commission denies petitions for reconsideration of the Policy Statement, Standards for Assessing Forfeitures, 56 FR 37665 (August 8, 1991) (Policy Statement). Several petitioners argued that the Policy Statement is really a binding substantive rule of law that was improperly adopted without notice and comment proceedings. The Commission disagrees because it considers the Policy Statement a general statement of policy that is not binding on the Commission or on its licensees, and notes that it expressly reserved the right in the Policy Statement to exercise discretion in specific cases. On its own motion, the Commission amended the base forfeiture amounts for tower lighting and marking violations to \$8,000 for all services, and made clarifying edits to several non-section 503(b) forfeiture standards to achieve consistency with the relevant statutory sections.

EFFECTIVE DATE: May 14, 1992.

FOR FURTHER INFORMATION CONTACT: Douglas Cooper, Office of General Counsel, Federal Communications Commission (202) 632–6990.

SUPPLEMENTARY INFORMATION: .

Memorandum Opinion and Order

Adopted: May 14, 1992; Released: June 4, 1992.

By the Commission: Commissioner Quello dissenting and issuing a statement; Commissioner Duggan concurring and issuing a statement.

I. Introduction

1. In this Memorandum Opinion and Order, we deny several petitions for reconsideration of our Policy Statement, Standards for Assessing Forfeitures, 6 FCC Rcd 4695 (1991) (Policy Statements.)¹

II. Background

- 2. In 1989, Congress amended the Communications Act of 1934 to increase substantially the maximum dollar amounts of forfeitures the Commission could impose under section 503(b) and under other sections of the Act.2 Previously, section 503(b) limited the Commission's forfeiture authority to \$20,000 for broadcasters and common carriers and to \$5,000 for all other services. The amended section 503(b) now provides the Commission with authority to assess forfeitures of up to \$25,000 against broadcasters, cable operators or applicants for such facilities, \$100,000 against common carriers or applicants for such facilities, and \$10,000 against others. In addition, there is a limit on forfeitures for continuing violations involving a single act or failure to act of \$250,000 for broadcasters, cable operators or applicants for such facilities and \$1,000,000 for common carriers or applicants for such facilities. A limit of \$75,000 applies to continuing violations involving a single act or failure to act by others. The Commission's forfeiture rule has been amended to reflect the higher forfeiture amounts. 47 CFR 1.80(b)(1)-(3).
- 3. On August 1, 1991, the Commission released the *Policy Statement* to assist both the Commission and licensees in adjusting to the statutory increases. The *Policy Statement* provides base forfeiture amounts for a wide range of generic violations, e.g., "[f]ailure to file required forms or information." The base forfeiture amount for each type of violation is a percentage of the statutory maximum for the service involved for each violation or each day of a continuing violation as set forth in section 503(b). The base forfeiture amount may be increased or decreased by applying adjusting criteria as

Association for the Advancement of Colored People, the League of United Latin American Citizens, the National Black Media Coalition, and the Office of Communication of the United Church of Christ (Civil Rights Organizations). Comments were filed by: Civil Rights Organizations; the Land Mobile Communications Council (LMCC); Metropolitan Houston Paging Services, Inc. (MHP): Midwestern Relay Company (Midwestern): Mobile Marine Radio (MMR): the National Association of Broadcasters (NAB); Pacific Bell; Seattle Marine Radio, Inc. (SMR): and Waterway Communications System Inc. (WATERCOM). Reply Comments were filed by: NTCA; Telocator; and USTA. We also received informal comments from KFS World Communications and the Puerto Rico Radio Broadcasters Association. In addition, we received a Motion to Supplement the Record from Victoria Cellular Corporation, which we will treat as an informal comment.

* Pub. L. 239, 101st Cong., 1st Sess., 103 Stat. 2131 (1989) (amending 47 U.S.C. 202(c), 203(e), 205(b), 214(d), 219(b), 220(d), 382, 386, 503(b)).

¹ Petitions for Reconsideration were filed by the following: Alliance of Small Common Carriers (Alliance): the Illinois Telephone Association (Illinois): Blooston, Mordkofsky, Jackson & Dickens on behalf of 24 common carrier radio licensees (Licensees): the National Telephone Cooperative Association (NTCA): the Organization for the Protection and Advancement of Small Telephone Companies (OPASTCO): Telocator: Telephone and Data Systems, Inc. (TDS): the United States Telephone Association (USTA): and the National

relevant to the facts in any particular

4. In adopting the Policy Statement. the Commission expressly retained 'discretion in situations that arise" in individual cases and did not consider the Policy Statement to be a binding rule. Policy Statement, 6 FCC Rcd at 4695 (para. 1), quoting Guardian Federal Savings & Loan Ass'n v. Federal Savings and Loan Insurance Co., 589 F.2d 658, 666 (D.C. Cir. 1978). Accordingly, the Commission issued the Policy Statement without conducting a rulemaking proceeding pursuant to section 553 of the Administrative Procedure Act (APA). The Policy Statement explicitly stated that the notice and comment provisions of the APA do not apply and cited the exception to general rulemaking requirements reserved for general statements of policy. Policy Statement, 6 FCC Rcd at 4696 (para. 10), citing 5 U.S.C. 553(b)(A).

III. Discussion

- 5. The primary argument of most of the petitioners and commenters is that the Policy Statement is in reality a substantive rule, not a general statement of policy, and therefore was improperly adopted without notice and comment.3 For the reasons set forth below, we disagree.
- 6. As noted above, at the beginning of the Policy Statement the Commission expressly indicated its intent to retain discretion in specific cases. 6 FCC Rcd at 4695. As we elaborated in denying a request for stay:

[T]he Policy Statement simply describes the general approach the Commission may take in forfeiture cases and is not binding on any licensees or the Commission. The Policy Statement does not impose any obligations on [licensees] or require the Commission to issue a forfeiture of any particular magnitude-or any forfeiture at all. * * * Most importantly, proposed forfeiture amounts may be challenged in any proceeding in which they are applied and the commission has broad discretion to take any equitable factors into account, as relevant, to ensure that [licensees] are not assessed substantial forfeitures unless warranted.

Order, 6 FCC Rcd 7016 (1991) (footnote omitted).4 To the extent any confusion

remains, we reiterate that the Policy Statement may guide us and the staff in particular cases, we do not intend for the Commission or the staff to be bound by it. In addition, both the Commission and the staff intend to apply these guidelines flexibly.5 In particular, we and the staff remain committed to deciding every forfeiture case on the basis of the specific facts and equities presented in the record of that case.6 See 47 U.S.C. 503(b)(2)(D) (in addition to enumerated factors for setting forfeiture amounts, Commission is required to take into account "such other matters as justice may require").

7. We believe viewing the forfeiture standards as a policy statement rather than a rule fits comfortably within judicial precedent. As the D.C. Circuit recently stated, in determining whether action constitutes a substantive rule or a policy statement, "the ultimate issue is 'the agency's intent to be bound.' ' Public Citizen, Inc. v. NRC, 940 F.2d 679. 682 (D.C. Cir. 1991), quoting Vietnam Veterans v. Secretary of the Navy, 843 F.2d 528, 538 (D.C. Cir. 1988). As noted above, we explicitly do not intend to be bound by the Policy Statement. The Policy Statement "does not establish a 'binding norm,' " is "not finally determinative of the issues or rights to which it is addressed," and does not "impose any rights and obligations"; moreover, it "genuinely leaves the agency and its decisionmakers free to exercise discretion." American Hospital Ass'n v. Bowen, 834 F.2d 1037, 1046 (D.C. Cir. 1987) (internal citations omitted).7 Thus, the Policy Statement is not a rule.

8. Some petitioners also argue that the Policy Statement constitutes a substantive rule because it allegedly changes § 1.80(b)(4) of the Commission's Rules.8 That section lists the statutory factors that the agency is required to consider in establishing a forfeiture level-"the nature, circumstances, extent and gravity of the violations and. with respect to the violator, the degree or culpability, any history or prior offenses, ability to pay, and such other matters as justice may require." See also 47 U.S.C. 503(b)(2)(D). As is apparent from even a cursory review of the adjustment factors in the Policy Statement, they closely track the statutory factors repeated in § 1.80(b)(4) of the Rules.9 In any event, the Commission and the staff will continue to evaluate all evidence in the record of a particular case regarding the factors set forth in the Act and the rules. including any equitable arguments made by a licensee. Thus, the Policy Statement is consistent with § 1.80(b)(4).

9. Our statement of the Policy Statement since its adoption is consistent with our intent that it not limit our discretion under the Communications Act. 10 For example, in several Notices of Apparent Liability involving violations of the tariff-filing requirements of the Telephone Operator Services Improvement Act of 1990, 47 U.S.C. 228, the Commission took into account the fact that a new statute was at issue, even though this did not fit within any of the adjustment factors in the Policy Statement.11 Conversely, the Commission has chosen not to take into account the fact that a violation was repeated even though this is an adjustment factor in the Policy Statement.12

5 We continue to believe that it would be inappropriate to proceed by notice and comment rulemaking to adopt binding rules rather than a general statement of policy. Such an approach would unduly limit our discretion in particular cases, which we do not want to do. We note that in urging agencies to adopt forfeiture standards, the Administrative Conference of the United States specifically sanctioned the use of rulemaking or policy statements. Agency Assessment and Mitigation of Civil Monetary Penalties (Recommendation No. 79–3), 1 CFR 305.79–3(A)(3).

We recognize that, taken out of context, certain language in the Policy Statement could be read as indicating an intent by the Commission to be bound by its terms. See, e.g., Licensees Petition at 19-20. We clarify here that that was not our intent.

7 The standards set forth in the Policy Statement appear to be much less specific than the parole eligibility guidelines that the court determined to be substantive rules rather than a statement of policy See Pickus v. United States Board of Parole, 507 F.2d 1107 (D.C. Cir. 1974). One set of "guidelines" in that case consisted of "nine general categories or factors, broken down into a total of 32 subcategories, often fairly specific," and another set was even "more formula like." Id., 507 F.2d at 1113. Nor is there any suggestion in that decision that the agency intended to retain broad discretion to act in particular cases. In contrast, here the Commission has stated from the outset that it intends to retain discretion to act as appropriate in particular cases

* See NTCA Petition at 4-5, TDS Petition at 7, Telocator Petition at 4. USTA Petition at 15-16; NAB Comments at 2: USTA Reply at 3.

10 The D.C. Circuit has recognized that application of agency action can provide evidence of whether it is properly categorized as a policy statement. Public Citizen, 940 F.2d at 689.

15 See, e.g., TVX Broadcast Group, 6 FCC-Red 7494 (1991).

⁹ The nature, circumstances, extent and gravity of the violation are reflected in the following adjustment factors: egregious misconduct; substantial harm; substantial economic gain; and minor violation. The degree of culpability and history of prior offenses are reflected in the following adjustment factors: intentional violation: prior violations of same or other requirements; repeated or continuous violation; good faith or voluntary disclosure; and history of overall compliance. Ability to pay is reflected in the ability to pay and inability to pay adjustment factors. Finally, such other matters as justice may require will be taken into account in particular cases as they arise.

¹¹ See, e.g., National Tele-Sav., Inc., 6 FCC Red 6947 (1991); Call West, 6 FCC Rcd 6941 (1991).

³ See Petitions from Alliance, Licensees, NTCA. OPATSCO, TDS, Telocator, USTA: Comments from MHP, NAB, Pacific Bell; and Reply Comments from NTCA, Telocator, USTA.

⁴ Licensees filed a Petition for Reconsideration of Stay Denial on December 30, 1991. Because we are denying the petitions for reconsideration of the Policy Statement, we dismiss Licensees' petition as

10. Finally, we note that petitioners raise a wide variety of concerns regarding how the *Policy Statement* will be implemented. ¹³ In light of the fact that the *Policy Statement* simply provides some general guidance that may be used in particular cases, we believe such concerns are more appropriately addressed in the context of specific cases. Accordingly, we will not address such implementation matters here.

13 See, e.g., Illinois Petition at 1–5 (base forfeiture amounts for common carriers are too high), Alliance Petition at 7–13 (application of base forfeiture amounts to all common carriers in uniform manner is discriminatory and should instead be applied on a tiered basis); Civil Rights Organizations Petition at 3–7 (broadcast Equal Employment Opportunity violations should be assigned higher priority within the spectrum of rule violations); Licensees Petition at 6–9 (the Policy Statement contravenes policies protecting small businesses).

11. We will, however, on our own motion, make one adjustment to the Policy Statement. Because licensees in various services share towers, we believe it is appropriate that the base amount for failure to comply with prescribed lighting and marking requirements should be the same for all services. Accordingly, we are changing the base amount in the Policy Statement for such violations to \$8,000 for all services. In addition, we previously neglected to include violations of 18 U.S.C. 1342 (fraud by wire, radio or television), and are now adding this violation to the Policy Statement on our own motion. A copy of the amended Appendix to the Policy Statement is attached hereto.14

12. Accordingly, It is ordered That the petitions for reconsideration of the Policy Statement, Standards for Assessing Forfeitures, 6 FCC Rcd 4695 (1991), are denied. It is further ordered That Licensees' Petition for Reconsideration of Stay Denial filed December 30, 1991 is dismissed as moot. It is further ordered That the Appendix to the Policy Statement is revised to read as set forth hereto, effective upon adoption.

List of Subjects in 47 CFR Part 1

Penalties.
Federal Communications Commission.
Donna R. Searcy,

Secretary.

Standards for Assessing FCC Forfeitures

I. Base Amounts for Section 503 Forfeitures

Violation		BC/cable (\$25,000)	CC (\$100,000)	Other (\$10,000)	
Misrepresentation/lack of candor	80	20,000	80,000	8,000	
Construction and/or operation without an instrument of authorization for the service	80	20,000	80,000	8,000	
Unauthorized substantial transfer of control		20,000	80,000	8,000	
Violations of rules relating to distress and safety frequencies	80	20,000	80,000	8,000	
False distress communications	0 (0.00)	20,000	80,000	8,000	
Failure to permit inspection.		18,750	75,000	7,500	
Violations of operator services requirements	75	n.a.	75,000	7,500	
Malicious interference	70	17,500	70,000	7.000	
Failure to respond to Commission communications.	70	17,500	70,000	7,000	
Importation or marketing of unauthorized equipment.	100000	n.a.	70,000	7,000	
Exceeding authorized antenna height	60	15,000	60,000	6,000	
Exceeding power limits	- 22220	12,500	50,000	5,000	
Unauthorized emissions	50	12,500	50,000	5,000	
Using unauthorized frequency	50	12,500	50,000	5,000	
EBS equipment not installed or operational	50	12,500	n.a.	n.a	
Transmission of indecent/obscene material.	50	12,500	n.a.	5.000	
Violation of broadcast EEO rules	50	12,500	n.a.	n.a	
Violation of producast EEO rules Violation of political rules: reasonable access, lowest unit charge, equal opportunities and discrimination	50	12,500	n.a.	11.8	
	50	12,500	50,000	5,000	
Fraud by wire, radio or television	40	10,000	40,000	4,000	
Use of unauthorized equipment	40	10,000	40,000	4,000	
Violation of children's television commercialization or programming requirements	40	10,000	n.a.	n.a	
Violation of children's television commercialization or programming requirements	40	10,000	n.a.	n.a	
	40	10,000	40,000	4.000	
Construction or operation at unauthorized location	40	10,000	40,000	4,000	
Failure to engage in required frequency coordination	varies	8,000	8,000	8.000	
Failure to comply with prescribed lighting and marking		7,500	30,000	3,000	
Failure to file required forms or information	30	7,500	п.а.	n.a	
Violation of public file rules		6,250	n.a.	n.a	
Violation of sponsorship ID requirements	19 100000	6,250	n.a.	n.a	
Violation of requirements pertaining to broadcasting of lotteries or contests		5,000	n.a.	n.a	
Violation of technical logs/time brokerage agreements file requirements	1200	5,000	n.a.	n.a	
Broadcasting telephone conversations without authorization	- 77.50	2,500	10,000	1.000	
Failure to make required measurements or conduct required monitoring	9.40	2,500	n.a.	n.a	
Violation of enhanced underwriting requirements	1000	2,500	10,000	1,000	
Failure to provide station ID.		2,500	10,000	1.000	
Unauthorized pro forma transfer of control	1000	2,500	10,000	1,000	
Failure to maintain required records		1,250	5,000	500	
Miscellaneous violations	5	1,250	5,000	501	

¹ The forfeiture ceilings per violation or per day of a continuing violation contained in section 503 of the Communications Act and the Commission's Fiules are \$100,000 for common carriers or applicants, \$25,000 for broadcasters and cable operators or applicants, and \$10,000 for all others. 47 U.S.C. 503(b)(2); 47 CFR 1.80. In addition, for continuing violations involving a single act or failure to act, there is an overall limit of \$1,000,000 for common carriers or applicants, \$250,000 for broadcasters and cable operators or applicants, and \$75,000 for all others. Id. The base amounts listed are for a single violation or single day of a continuing violation. Unless Commission authorization is required for the behavior involved, a section 503 forfeiture proceeding against a non-license or non-applicant who is not a cable operator or is not operating in the radio control or citizens band radio services can only be initiated for a second violation, after issuance of a citation in connection with a first violation. 47 U.S.C. 503(b)(5). Forfeitures issued under other sections of the Act are dealt with separately in Section III below.

¹⁴ We are also clarifying in the Appendix that certain non-section 503 forfeitures are evaluated on a per day basis under the relevant statutory provisions. See, e.g., The Cargo Vessel Kodiak Enterprise, 7 PCC Red 1847 (1992).

II. Adjustment Criteria for Section 503 **Forfeitures**

	Percent
Upward Adjustment Criteria	
(1) Egregious misconduct	50-90
(2) Ability to pay/relative disincentive 3	50-90
(3) Intentional violation	50-90
(4) Substantial harm	40-70
(5) Prior violations of same or other re-	
quirements	40-70
(6) Substantial economic gain	20-50
(7) Repeated or continuous violation	3 varies

	Percent
Downward Adjustment Criteria	
(1) Minor violation 4	50-90
(2) Good faith or voluntary disclosure	30-60
(3) History of overall compliance	20-50
(4) Inability to pay	⁵ varies

applied to the base forfeiture amount. More than

one factor may apply in a given case.

The Commission is required by the Communications Act to take ability to pay into consideration in assessing forfeiture amounts. 47 U.S.C. 503(b)(2)(D).

^a The percentage adjustment for this criterion could vary up to the statutory maximum per violation or per day of a continuing violation.
⁴ A "minor" violation is misconduct which is at a low level of seriousness within the violation category. A minor violation is the opposite of "egregious misconduct."
^b As noted above, the Commission is required by

conduct."

⁵ As noted above, the Commission is required by the Communications Act to take ability to pay into consideration in assessing forfeiture amounts. 47 U.S.C. 503(b)(2)(D). The application of a downward adjustment for inability to pay is based upon a showing of substantial financial hardship inability to pay would generally be considered as a downward adjustment factor only upon a specific showing by the entity against whom forfeiture action is taken.

III. Non-Section 503 Forfeitures

Violation	Statutory amount
Sec. 203(e) Common carrier tariffs Sec. 205(b) Common carrier prescriptions Sec. 214(d) Common carrier line extensions Sec. 219(b) Common carrier reports Sec. 220(d) Common carrier records & accounts Sec. 220 Dial-a-Porn.	\$6,000 + \$300/day. \$6,000 + \$300/day. \$12,000. \$1,200/day. \$1,200. \$6,000/day. \$50,000 maximum/day.
	\$5,000/day (owner) \$1,000 (master). \$500/day (owner) \$100 (master). \$200/day.

⁷ Unlike section 503, which establishes maximum forfeiture amounts, other sections of the Act, with one exception, state prescribed amounts of forfeitures for violations of the relevant section. These amounts are then subject to mitigation or remission under section 504 of the Act. The one exception is section 223 of the Act, which provides a maximum of \$50,000 per day. For convenience, the Commission will treat the \$50,000 per day set forth in section 223 as if it were a prescribed base amount, subject to downward adjustments.

Note: Non-section 503 forfeitures may be adjusted downward using the "Downward Adjustment Criteria" shown for section 503 forfeitures in Section II above.

47 CFR Parts 2 and 15

[GEN Docket No. 89-44; FCC 92-183]

Procedure for Measuring **Electromagnetic Emissions From Digital Devices**

AGENCY: Federal Communications Commission (FCC).

ACTION: Final rule.

SUMMARY: This action incorporates into the FCC Rules by reference the American National Standards Institute's (ANSI) test procedure C63.4-1991 (C63.4) except for sections 5.7, 9 and 15 as the standard the Commission will use for determining compliance of digital devices regulated under part 15 of the FCC Rules. It updates and replaces the present FCC test procedure, FCC/OET MP-4 (1987). Sections 5.4.5 through 5.5 of C63.4 also include new criteria for determining the suitability of a test site used for testing digital devices, which replace the current Commission criteria in FCC/OET Bulletin 55. Adoption of C63.4 will benefit both digital device manufactures and the Commission.

since it is intended to harmonize FCC test procedures with the international procedures for such devices and it represents a consensus agreement on test procedures to be used to obtain repeatable measurement results.

EFFECTIVE DATE: July 13, 1992. The incorporation by reference of ANSI C63.4-1991 listed in the regulations was approved by the Director of the Federal Register as of July 13, 1992.

FOR FURTHER INFORMATION CONTACT: Mr. Hugh L. Van Tuvl, FCC Laboratory, 7435 Oakland Mills Road, Columbia, MD 21046, (301) 725-1585, extension 221.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission's Report and Order (R&O) in General Docket 89-44, adopted April 16, 1992, and released May 21, 1992. The full text of this R&O, including the Final Regulatory Flexibility Analysis, is available for inspection and copying during normal business hours in the FCC Dockets Branch (room 230), 1919 M Street, NW., Washington, DC. The complete text of this decision may also be purchased from the Commission's copy contractor. Downtown Copy Center, (202) 452-1422, 1114 21st Street, NW., Washington, DC 20036.

Summary of Notice

1. Personal computers and other digital electronic equipment are required to meet radionoise limits set forth in

part 15 of the rules in order to control interference to radio communications. The current Commission measurement procedure for determining compliance of this equipment is contained in FCC publication MP-4, adopted in 1983 and updated in 1987. Information submitted by the computer industry, along with our own experience in testing computers at the FCC Laboratory, indicated an update and revision of MP-4 was required. Accordingly, the Notice of Proposed Rule Making (NPRM) in this proceeding 54 FR 11415, March 20, 1989 proposed a new measurement procedure, called TP-5, as a replacement for MP-4.

2. The comments submitted in response to the NPRM expressed many reasonable differing viewpoints on the best way to measure emissions from digital devices. The Commission elected to work with the voluntary industry standards developing organization, ANSI C63 Committee (C63), to obtain a consensus agreement among the concerned industry parties before adopting a digital device measurement procedure. In a joint effort between the Commission staff and the ANSI C63 Committee, ANSI C63.4-1988 was revised and modified for use in testing digital devices. Each technical issue received considerable debate in C63 before a compromise was agreed upon and accepted as the best possible

solution to that issue. The resulting test procedure basically follows the technical framework and initiatives set forth in the TP-5 proposal, however, it resolves the many technical issues raised in this proceeding in a competent and reasonable manner. We reviewed C63.4 after it was revised and approved by C63 as a National Standard and found that it appears to meet our needs for testing digital devices for compliance with part 15 of the FCC Rules. Accordingly, the Commission adopted a Further Notice of Proposed Rule Making (FNPRM) 56 FR 7004, February 21, 1991 proposing to replace MP-4 with C63.4, instead of TP-5. The FNPRM also proposes to use the new criteria in C63.4 to determine the suitability of a test facility used for testing digital devices.

3. Twenty parties, consisting of individuals, trade associations, digital device manufacturers, and test firms filed comments to the FNPRM. Ten parties filed reply comments. Most of the commenters supported the adoption of ANSI C63.4-1991, by stating that it represents a reasonable industry consensus of the state-of-the-art techniques for measuring electromagnetic emissions from digital devices. Further, they note that the differing viewpoints on testing of digital devices raised in the NPRM have been resolved in a technically competent manner. Many of the supporting parties also observe that adoption of C63.4 will provide harmonization of the FCC test procedures with the procedures contained in or proposed for inclusion in CISPR Publication 22, the international standard and test procedure for measuring emissions from information Technology Equipment (ITE), the international term for digital devices. The supporting parties also state that this will simplify the procedures for determining compliance of digital equipment marketed in both the U.S.A. and in other countries.

4. Two parties oppose the adoption of the FNPRM. The opposing comments were considered and dismissed since they are either outside the scope of the proceeding or unacceptable. Several other parties offer suggestions for, or request clarifications of, the C63.4 specifications. In response to these comments on how the Commission will implement and use C63.4, the Commission clarified the following issues in the Report and Order: (1) The use of flush-mounted turntables; (2) the use of log-periodic antennas above 1 GHz; (3) the importance of physical site characteristics, in addition to site attenuation measurements, for evaluating a test facility; (4) the use of

on-site measurements for large digital devices; (5) the importance of the Appendices to C63.4; (6) the adoption process of modified versions of C63.4: (7) the use of a C63.4 interpretation panel; and (8) the extension of the transition period from MP-4 to C63.4 to January 1, 1994. In summary, ANSI C63.4-1991, except for sections 5.7, 9 and 15, is incorporated by reference into part 15 of the FCC Rules as the test procedure to be used by the Commission for determining the compliance of digital devices. In addition, sections 5.4.5 through 5.5 are incorporated by reference into part 2 of the rules as the new criteria for evaluating the suitability of measurement facilities used for testing digital devices.

5. Accordingly, it is ordered that under the authority contained in sections 4(i), 302, and 303 of the Communications Act of 1934, as amended, 47 U.S.C. section 154(i), 302, and 303, part 2 and part 15 of the Commission's Rules and Regulations are amended as set forth below. These rules are effective July 13, 1992. It is further ordered That this proceeding is Terminated.

List of Subjects

47 CFR Part 2

Site attenuation, Description of measurement facility, Incorporation by reference, Communications equipment.

47 CFR Part 15

Digital device measurement procedure, Incorporation by reference, Communications equipment.

Parts 2 and 15 of title 47 of the Code of Federal Regulations are amended as follows:

Rule Changes

A. Part 2 is amended as follows:

PART 2-[AMENDED]

1. The authority citation for part 2 continues to read as follows:

Authority: Sec. 4, 302, 303 and 307 of the Communications Act of 1934, as amended, 47 U.S.C. sections 154, 302, 303, and 307, unless otherwise noted.

Section 2.948 is amended by revising paragraph (b)(8) to read as follows:

§ 2.948 Description of measurement facilities.

(b) * * *

(8) A plot of site attenuation data.

(i) For a measurement facility that will be used for testing radiated emissions from a digital device for certification or verification on or after May 1, 1994, the site attenuation data shall be taken pursuant to the procedures contained in sections 5.4.5 through 5.5 of the following procedure: American National Standards Institute (ANSI) C63.4-1991, entitled "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz," published by the Institute of Electrical and Electronics Engineers, Inc. on March 21, 1991, with a correction sheet dated July 2, 1991, as document number SH13896. ANSI C63.4-1991, except for sections 5.7, 9 and 15, is incorporated by reference with the approval of the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. Copies of ANSI C63.4-1991 may be obtained from: IEEE Standards Department, 455 Hoes Lane, P.O. Box 1331, Piscataway, NI 08855-1331, Telephone 1-800-678-4333. Copies of ANSI C63.4-1991 may be inspected at the following locations:

(A) Federal Communications Commission, 1919 M Street, NW., Dockets Branch (room 239), Washington, DC.

(B) Federal Communications Commission, 2025 M Street, NW., Office of Engineering and Technology (room 7002), Washington, DC, or (C) Office of the Federal Register, 1100 L Street, NW., room 8401, Washington, DC.

(ii) For a measurement facility that will be used for testing radiated emissions from a device other than a digital device or, prior to May 1, 1994, from a digital device, the site attenuation data shall be taken pursuant to either ANSI C63.4–1991, sections 5.4.5. through 5.5, or FCC/OET Bulletin 55. See (section 2.948(b)(8)(i)) for more information on ANSI C63.4–1991.

(iii) This requirement does not apply to equipment that is not measured on an open field test site.

Part 15 is amended as follows:

PART 15-[AMENDED]

1. The authority citation for part 15 continues to read as follows:

Authority: Secs. 4, 302, 303, 304, and 307 of the Communications Act of 1934, as amended, 47 U.S.C. 154, 302, 303, 304, and 307-

2. Paragraph (a) of § 15.31 is revised to read as follows:

§ 15.31 Measurement standards.

(a) The following measurement procedures are used by the Commission to determine compliance with the technical requirements in this Part. Except where noted, copies of these procedures are available from the Commission's current duplicating

contractor whose name and address are available from the Commission's Consumer Assistance Office at 202–632–

(1) FCC/OET MP-1: FCC Methods of Measurements for Determining Compliance of Radio Control and Security Alarm Devices and Associated Receivers.

(2) FCC/OET MP-2: Measurement of UHF Noise Figures of TV Receivers.

(3) FCC/OET MP-3: FCC Methods of Measurements of Output Signal Level, Output Terminal Conducted Spurious Emissions, Transfer Switch Characteristics and Radio Noise Emissions from TV Interface Devices.

(4) FCC/OET MP-4 (1987): FCC Procedure for Measuring RF Emissions from Computing Devices

Note: This procedure may be used only on digital devices for which verification is obtained or an application for certification is filed, before May 1, 1994. For compliance testing of digital devices on or after May 1, 1994, see paragraph (5) of this section.

(5) Digital devices for which verification is obtained, or an application for certification is filed, on or after May 1, 1994, are to be measured for compliance using the following procedure excluding section 5.7, section 9 and section 15: American National Standards Institute (ANSI) C63.4-1991, entitled "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz," published by the Institute of Electrical and Electronics Engineers, Inc. on March 21, 1991, with a correction sheet dated July 2, 1991, as document number SH13896. This incorporation by reference was approved by the Director of the Federal Register in accordance with 5 U.S.C. 552(a) and 1 CFR part 51. The Commission encourages the use of this procedure for testing digital devices as soon as practical. Copies of ANSI C63.4-1991 may be obtained from: IEEE Standards Department, 455 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, Telephone 1-800-678-4333. Copies of ANSI C63.4-1991 may be inspected during normal business hours at the following locations: (i) Federal Communications Commission, 1919 M Street NW., Dockets Branch (room 239). Washington, DC, (ii) Federal Communications Commission, 2025 M Street NW., Office of Engineering and Technology (room 7002), Washington, DC or (iii) Office of the Federal Register,

1100 L Street, NW., room 8401, Washington, DC.

(6) FCC/OET MP-9: FCC Procedures for Measuring Cable Television Switch Isolation.

47 CFR Part 90

[PR Docket No. 91-66; RM-6146, RM-6361, FCC 92-233]

Private Land Mobile Radio Services; Secondary Fixed Operations in the 450-470 MHz Frequency Band

AGENCY: Federal Communications Commission.

ACTION: Final rule.

SUMMARY: The Commission has adopted a Report and Order amending part 90 of its Rules to make the frequencies in the 450–470 MHz band designated in § 90.261 for secondary fixed operations available in expanded geographical areas to a greater number of part 90 eligibles. This rule change will also reduce the time and expense for frequency coordination of secondary fixed assignments.

EFFECTIVE DATE: The effective date of the rule changes is July 13, 1992.

FOR FURTHER INFORMATION CONTACT: Eugene Thomson, Rules Branch, Land Mobile and Microwave Division, Private Radio Bureau, (202) 634–2443.

SUPPLEMENTARY INFORMATION: This is a summary of the Commission's Report and Order, PR Docket No. 91–66, adopted May 22, 1992, and released June 5, 1992. The full text of the Report and Order is available for inspection and copying during normal business hours in the FCC Dockets Branch, Room 230, 1919 M Street NW., Washington, DC. The complete text may be purchased from the Commission's copy contractor, Downtown Copy Center, 1114 21st Street NW., Washington, DC 20036, telephone (202) 452–1422.

Summary of Report and Order

Section 90.261 of the Rules identifies frequencies in the 450–470 MHz band that may be assigned to applicants for fixed use on a secondary basis to base/mobile operations. In March 1991, a Notice of Proposed Rule Making, 56 FR 13791, April 4, 1991 6 FCC Rcd 1800 (1991), was released that proposed to

Increase the number of 450-470 MHz frequencies available for secondary fixed operations and simplify the coordination requirements for applicants requesting these frequencies.

The Report and Order amends the Commission's Rule to (a) permit all part 90 eligibles (with the exception of Business Radio Service eligibles) to use all designated 450-470 MHz frequencies for secondary fixed use; (b) limit the availability of Business Radio Service frequencies for secondary fixed use only to Business Radio Service eligibles, as provided for in the current rules; (c) allow the coordination of secondary fixed applications to be made by the applicants "home" coordinator or by another certified frequency coordinator (with notification to all "primary" coordinators if an out-of-service frequency is recommended); (d) reduce maximum authorized transmitter power to 75 watts for non-urban secondary fixed stations, and permit secondary fixed stations to operate in previously restricted urban areas at 20 watts.

Radio.

Amendatory Text

47 CFR Part 90 is amended as follows:

PART 90-[AMENDED]

1. The authority citation for part 90 continues to read as follows:

Authority: Secs. 4, 303, 331, 48 Stat., as amended, 1066, 1082; 47 U.S.C. 154, 303 and 332 unless otherwise noted.

§§ 90.17, 90.19, 90.21, 90.23, 90.25, 90.53, 90.63, 90.65, 90.67, 90.73, 90.79, 90.81, 90.89, 90.91, 90.93, 90.95 [Amended]

2. 47 CFR 90.17(c)(10), 90.19(e)(15), 90.21(c)(6), 90.23(c)(7), 90.25(c)(13), 90.53(b)(12), 90.63(d)(14), 90.65(c)(27), 90.67(c)(17), 90.73(d)(18), 90.79(d)(12), 90.81(d)(3), 90.89(c)(9), 90.91(c)(9), 90.93(c)(3) and 90.95(d)(7) are revised to read as follows:

"The requirements for secondary fixed use of frequencies in this band are set forth in § 90.261."

3. 47 CFR 90.71 is amended by adding the entry 450–470 MHz to the Relay Press Radio Service Frequency Table in paragraph (b) and adding paragraph (c)(11) to read as follows:

§ 90.71 Relay Press Radio Service.

(b) * * *

RELAY PRESS RADIO SERVICE FREQUENCY TABLE

Frequen- cy or band	Class	Limitations		
450-470	Fixed	 		11
1				

(c) * * *

(11) The requirements for secondary fixed use of frequencies in this band are set forth in § 90.261.

§ 90.173 [Amended]

4. 47 CFR 90.173 is amended by removing the words "or 90.261 of the rules" at the end of the sentence in paragraph (j).

5. 47 CFR 90.175 is amended by adding a sentence at the end of paragraph (a) to

read as follows:

§ 90.175 Frequency coordination requirements.

(a) * * * Frequencies in the 450–470 MHz band, when use for secondary fixed operations, shall be assigned and coordinated pursuant to § 90.261.

6. 47 CFR 90.176 is amended by adding a paragraph (c) to read as follows:

§ 90.176 Interservice sharing of frequencies in the 150-174 and 450-470 MHz bands.

(c) Provisions governing the assignment and use of frequencies in the 450–470 MHz band for secondary fixed operations are provided in § 90.261.

7. 47 CFR 90.261 is revised to read as follows:

§ 90.261 Assignment and use of the frequencies in the band 450–470 MHz for fixed operations.

(a) Except as provided for in paragraphs (d) and (e) of this section, frequencies in the 450–470 MHz band as listed in the tables of frequencies for the radio services in this Part may be assigned to all eligibles, with the exception of Business Radio Service eligibles, for fixed use on a secondary basis to land mobile operations.

(b) Fixed stations located 140 km (87 mi) or more from the center of any urbanized area of 600,000 or more population are limited to a transmitter output power of 75 watts. Fixed stations less than 140 km (87 mi) from the centers of these areas are limited to a transmitter output power of 20 watts. Urbanized areas of 600,000 or more population are defined in the U.S.

Census of Population 1970, Vol. 1, Table 20, pages 1–74. The centers of the urbanized areas are determined from the Appendix, page 226, of the U.S. Department of Commerce publication "Airline Distance Between Cities in the United States."

(c) All fixed systems are limited to one frequency pair with 5 MHz spacing and must employ directional antennas with a front-to-back ratio of 15 dB, except that omnidirectional antennas having unity gain may be employed by stations communicating with a minimum of three receiving locations encompassed in a sector of at least 160° in azimuth. Stations authorized for secondary fixed operations prior to (effective date of the rules) may continue to operate under the conditions of their initial authorization.

(d) Frequencies in the Business Radio Service subject to § 90.75(c)(26) will be authorized only to Business Radio Service eligibles. Business Radio Service eligibles may not access frequencies allocated to another radio service for the purposes of conducting secondary

fixed operations.

(e) Coordination of assignable frequencies subject to the provisions of this section will be permitted by any certified frequency coordinator. If an applicant elects to obtain a frequency recommendation from the certified frequency coordinator for the service in which the applicant is eligible, the coordinator shall first attempt to recommend a frequency within the applicant's own radio service. If none are available, the coordinator may then recommend a frequency allocated to another radio service. If an applicant elects to obtain a frequency recommendation from a certified coordinator of a service in which the applicant is not eligible, that coordinator may only recommend a frequency allocated to the service for which the coordinator is certified. If a coordinator recommends a frequency allocated to a service where the applicant is not eligible on a primary basis, then the coordinator must notify all coordinators certified to recommend that frequency on a primary basis before submitting the application to the Commission. Concurrence by these coordinators will not be required, but if any of these coordinators objects to a recommendation, they must notify the coordinator making the frequency recommendation of such objection within 10 working days of certified

receipt of the recommendation.
(f) Secondary fixed operations
pursuant to paragraph (a) of this section
will not be authorized on the following
frequencies:

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration (NOAA)

50 CFR Part 672

[Docket No. 911176-2018]

Groundfish of the Gulf of Alaska

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Commerce. ACTION: Modification of closures.

SUMMARY: NMFS is rescinding the closures to directed fishing for sablefish by vessels using hook-and-line gear in the Southeast Outside and East Yakutat (SEEY) districts, West Yakutat (WY) district, and Central Regulatory Area (CRA) of the Gulf of Alaska (GOA) for a period coinciding with the Pacific halibut fishery. NMFS is announcing a new effective date for closures to directed fishing for sablefish by vessels using hook-and-line gear in the SEEY and WY districts and the CRA. These actions are necessary to ensure optimum utilization of sablefish and prevent unnecessary waste of sablefish bycatch in the directed Pacific halibut fishery.

EFFECTIVE DATE: 12 noon, A.l.t, June 8, 1992 through 12 midnight, A.l.t, December 31, 1992.

FOR FURTHER INFORMATION CONTACT:

Patsy A. Bearden, Resource Management Specialist, Fisheries Management Division, NMFS, (907) 586-7228.

SUPPLEMENTARY INFORMATION: The groundfish fishery in the GOA exclusive economic zone is managed by the Secretary of Commerce according to the Fishery Management Plan for Groundfish of the GOA (FMP) prepared by the North Pacific Fishery Management Council under authority of the Magnuson Fishery Conservation and Management Act. Fishing by U.S. vessels is governed by regulations implementing the FMP at 50 CFR parts 620 and 672. The Pacific halibut fishery is managed in accordance with regulations developed by the International Pacific Halibut Commission and adopted by the governments of the United States and Canada. The 1992 Pacific Halibut fishery regulations are codified at 50 CFR part 301 (57 FR 12878, April 14, 1992.

Directed fisheries for sablefish by operators of vessels using hook-and-line gear in the SEEY and WY districts and the CRA were previously closed by the following actions:

SEEY: 57 FR 22182, May 27, 1992 WY: 57 FR 23348, June 3, 1992 CRA: 57 FR 23965, June 4, 1992

The Director of the Alaska Region, NMFS (Regional Director), has determined that sufficient sablefish total allowable catch (TAC) remains in these areas to allow retention of sablefish during the Pacific halibut fishery, which is scheduled to open in the GOA at noon on June 8, 1992, in amounts greater than the amount allowed under the directed fishing closure. Failure to allow this retention would result in increased waste of sablefish bycatch in the Pacific halibut fishery. Therefore, NMFS is rescinding the closures to directed fishing for sablefish by operators of vessels using hook-and-line gear in the SEEY and WY districts and the CRA for the period from 12 noon A.l.t, June 8, 1992 until 12 noon, A.l.t, June 9, 1992, the scheduled closure of the Pacific halibut

The Regional Director, in accordance with § 672.24(c)(3)(i), has determined that the share of the sablefish TAC assigned to hook-and-line gear in the SEEY and WY districts and the CRA that will remain after the June 9, 1992, Pacific halibut fishery closure will be taken before the end of the year.

Therefore, to provide adequate bycatch amounts of sablefish to ensure continued groundfish activity by hookand-line gear, NMFS is prohibiting directed fishing for sablefish by vessels using hook-and-line gear in the SEEY and WY districts and the CRA, effective from 12 noon A.l.t, June 9, 1992 through 12 midnight, A.l.t, December 31, 1992.

Directed fishing standards for applicable gear types may be found in the regulations at § 672.20(g).

Classification

This action is taken under 50 CFR 672.24 and is in compliance with Executive Order 12291.

Vol. 57, No. 114

Friday, June 12, 1992

This section of the FEDERAL REGISTER contains notices to the public of the proposed issuance of rules and regulations. The purpose of these notices is to give interested persons an opportunity to participate in the rule making prior to the adoption of the final rules.

DEPARTMENT OF THE TREASURY

Office of Thrift Supervision

12 CFR Part 563

[No. 92-247]

RIN 1550-AA41

Savings Association Membership in the Federal Home Loan Bank System

AGENCY: Office of Thrift Supervision, Treasury.

ACTION: Proposed rule, reopening of comment period and notice of public hearing.

SUMMARY: The Office of Thrift
Supervision (OTS) is hereby: (1)
Reopening and extending until July 15,
1992 the comment period on the
proposed rule entitled "Savings
Association Membership in the Federal
Home Loan Bank System" published for
comment on March 12, 1992 (57 FR 8732
(March 12, 1992)); and (2) announcing a
public hearing on the proposed rule to
be held on July 15, 1992.

DATES: Comments must be received on or before July 15, 1992. The public hearing will be held on July 15, 1992 from 9 a,m. until 12 p.m. Requests to participate in the hearing must be received no later than June 24, 1992. The written statements of those accepted as participants in the hearing must be received no later than July 3, 1992.

ADDRESSES: Send comments, requests to participate in the hearing, and written statements of hearing participants to Director, Information Services Division, Public Affairs, Office of Thrift Supervision, 1700 G Street, NW., Washington, DC 20552, Attention Docket No. [92-247]. These submissions may be hand delivered to 1700 G Street, NW. from 9 a.m. to 5 p.m. on business days: they may be sent by facsimile transmission to FAX Number (202) 906-7753 or (202) 906-7755. Submissions must be received by 5 p.m. on the day they are due in order to be considered by the OTS. Late-filed, misaddressed or

misidentified submissions will not be considered in this rulemaking. Comments will be available for inspection at 1700 G Street, NW., Street Level.

FOR FURTHER INFORMATION CONTACT: Richard Blanks, Counsel (Banking and Finance), (202) 906–7037, Chief Counsel's Office; Robyn Dennis, Program Manager, (202) 906–5751; or John Price, Deputy Assistant Director, (202) 906– 5745; Policy; Office of Thrift Supervision, 1700 G Street, NW., Washington, DC 20552.

SUPPLEMENTARY INFORMATION: On March 12, 1992, the Office of Thrift Supervision (OTS) proposed to adopt a rule which would require that all savings associations obtain and maintain membership in a Federal Home Loan Bank. The 60-day comment period for the proposed ended on May 11, 1992.

In light of the nature of the comments received in response to the proposal the Director of the OTS has determined that it would be appropriate to reopen briefly the comment period on the proposed rule for the specific and limited purpose of soliciting public comment on the following topics:

(1) The future of the Federal Home Loan Bank System in light of the Federal Deposit Insurance Corporation Improvement Act of 1991, Public Law 102–242, 105 Stat. 2236 (1991);

(2) The costs and benefits associated with mandatory or voluntary membership for thrift institutions; and

(3) The appropriate treatment of Savings Association Insurance Fundinsured institutions that are no longer savings associations as a result of so called "Oakar" or "Sasser" transactions. See 12 U.S.C. 1815(d)(2), (3) of the Federal Deposit Insurance Act. 12 U.S.C. 1811, et seq.

At the close of this reopened comment period, on July 15, 1992, the OTS will hold a public hearing on these issues. Persons wishing to participate in this hearing should send a written request to participate to the address listed in the "ADDRESSES" portion of this document, to be received no later than June 24, 1992. The request to participate in the hearing must include the following information: (1) The name, address, and business telephone of the participant; (2) the entity or entities that the participant will be representing; and (3) a brief summary of the participant's remarks,

identifying the specific issues to be addressed.

Depending on the number of requests received, participants may be limited in the length of their oral presentations. The OTS will notify participants of the time scheduled for their presentation. The OTS anticipates establishing panels of participants for presentations and reserves the right to limit the number of participants and to select, in its discretion, those persons who may make oral presentations if it receives more requests for participation than may be accommodated in the time available.

Participants will be required to submit written statements in advance of the hearing date. These written statements should incorporate the major points to be presented at the hearing and, if they exceed 25 double-spaced, typewritten pages, should be accompanied by an Executive Summary of no more than 3–5 pages. Written statements must be received no later than July 3, 1992, and should be sent to the address listed in the "ADDRESSES" portion of this document.

By the Office of Thrift Supervision.

Timothy Ryan,

Director.

BILLING CODE 6720–01-M

THRIFT DEPOSITOR PROTECTION OVERSIGHT BOARD

12 CFR Part 1503

Privacy Act Procedures

AGENCY: Thrift Depositor Protection Oversight Board.

ACTION: Proposed rule.

SUMMARY: This proposed rule prescribes procedures to implement the Privacy Act of 1974, 5 U.S.C. 552a. The Thrift Depositor Protection Oversight Board, which is an agency for the purposes of the Privacy Act, is required to promulgate regulations establishing such procedures. The objective of this rule is to facilitate the exercise of the rights conferred on individuals by the Privacy Act and to ensure that the disclosure of information contained in systems of records maintained by the Board is in compliance with the Privacy Act.

DATES: Comments must be submitted on or before August 11, 1992.

ADDRESSES: Comments may be mailed to Office of General Counsel, Thrift Depositor Protection Oversight Board, 1777 F Street, NW., Washington, DC 20232.

FOR FURTHER INFORMATION CONTACT: Lawrence Hayes, telephone (202) 786– 9681.

SUPPLEMENTARY INFORMATION:

Background

The Thrift Depositor Protection Oversight Board ("Board") is a corporate instrumentality of the United States, established as the "Oversight Board" by section 21A(a)(1) of the Federal Home Loan Bank Act, 12 U.S.C. 1441a(a)(1), as added by the Financial Institutions Reform, Recovery, and Enforcement Act of 1989 ("FIRREA"). The Oversight Board was redesignated as the Thrift Depositor Protection Oversight Board by the Resolution Trust Corporation Refinancing, Restructuring, and Improvement Act of 1991, Pub. L. No. 102-233, sec. 302(a), 105 Stat. 1761, 1767. The Board's principal duty is to oversee the Resolution Trust Corporation ("RTC"), also established under FIRREA, whose principal duty is to manage and resolve cases involving failing and failed thrift institutions.

Pursuant to 12 U.S.C. 1441a(a)(2), the Board is an agency of the United States for the purposes of the Privacy Act of 1974, 12 U.S.C. 552a. The promulgation of regulations establishing procedures for access to and amendment of records pertaining to an individual maintained in a system of records is required by 5 U.S.C. 552a(f).

Proposed Rule

The Board reviews overall strategies, policies, and goals established by the RTC for its activities, approves its periodic financing requests prior to implementation, and reviews the RTC's regulations, procedures, and overall performance. With respect to casespecific matters involving individual case resolutions, asset dispositions, and its day-to-day operations, the RTC makes determinations and takes such actions as it deems appropriate without any prior review, approval, or disapproval by the Board. As a consequence of the Board's focus on issues of policy and overall review, the files of the Board are generally not organized in groups of records from which information about an individual may be retrieved by the use of the individual's name or personal identifier. the "systems of records" that are the concern of the Privacy Act. Board

information that is retrievable by use of the name or symbol of an individual person is restricted to files concerning Board employees, applicants for employment, members of advisory boards established by the Board pursuant to 12 U.S.C. 1441a(d) (who are special government employees), and cadidates for advisory board membership.

The rule proposed by the Board implements Privacy Act requirements with respect to the promulgation and contents of regulations concerning systems of records in which information is retrievable by the name or personal identifier of an individual. Section 1503.3 would establish procedures whereby an individual can be notified in response to his or her request whether any system of records of the Board contains a record pertaining to such individual. Section 1503.4 sets forth reasonable requirements for identifying an individual who requests his or her records. Sections 1503.4, 1503.5, and 1503.6 would establish procedures for the disclosure to an individual of records pertaining to such individual that are maintained by the Board. Sections 1503.7, 1503.8, and 1503.9 would establish procedures for reviewing a request from an individual concerning the amendment of a record pertaining to such individual maintained by the Board and for an appeal within the agency of an initial adverse determination with respect to such request. Section 1503.11 would establish fees that may be charged an individual for duplicating copies of his or her records, excluding the cost of any search for and review of such records. The regulations as a whole would provide the means necessary for an individual to exercise fully his or her rights under the Privacy Act.

This rule is proposed pursuant to the requirement of 5 U.S.C. 552a(f) and to implement the provisions and intent of the Privacy Act.

Paperwork Reduction Act

The collections of information contained in this notice of proposed rulemaking have been reviewed and approved by the Office of Management and Budget in accordance with the Paperwork Reduction Act of 1980 (44 U.S.C. 3504(h)) and assigned control number 3203-0001, which expires December 31, 1994. Comments on the collections of information should be sent to the Office of Information and Regulatory Affairs, Office of Management and Budget, Paperwork Reduction Project (Agency Code 1551), Washington, DC 20503, with copies to the Thrift Depositor Protection

Oversight Board at the address previously specified.

The collections of information in this proposed rule are in §§ 1503.3, 1503.4 and 1503.7. This information is required by the Board under §§ 1503.3 and 1503.4 to identify inquirers seeking to know whether a system of records contains information relating to an individual and to identify individuals or representatives of individuals seeking access to records pertaining to such individuals. Information is required under § 1503.7 for the appropriate amendment or correction of records pertaining to individuals. This information will be used to process such inquiries and requests, amend or correct records, and protect records pertaining to individuals in accordance with the Privacy Act. The likely respondents are individuals or their representatives: Board employees, former employees, applicants for employment, and special government employees providing services for the Board.

The total annual reporting and recordkeeping burden that will result from these sections is estimated not to exceed ten hours. The estimated average burden hours per response is not more than one half hour under § \$ 1503.3 and 1503.4 and one hour under § 1503.7. The annual number of likely respondents is estimated not to exceed fifteen, and the proposed frequency of response is on occasion.

Executive Order 12291

This proposed rule is not a major rule under Executive Order No. 12291. The economic impact of the rule is minimal.

Regulatory Flexibility Act

The Thrift Depositor Protection
Oversight Board certifies that the rule
would not have a significant economic
impact on a substantial number of small
entities within the meaning of the
Regulatory Flexibility Act (5 U.S.C. 601
et seq.) The Board's systems of records
are expected to be few, small in size,
and generally limited in scope to records
concerning Board employees, former
employees, applicants for employment,
and special government employees.

List of Subjects in 12 CFR Part 1503

Privacy, Records.

For the reasons set forth in the preamble, it is proposed to amend chapter XV of title 12 of the Code of Federal Regulations by adding new part 1503 to subchapter A to read as follows:

PART 1503—PRIVACY ACT PROCEDURES

Sec.

1503.1 Purpose and scope.

1503.2 Definitions.

1503.3 Procedures for determining if an individual's records are contained in a system of records.

1503.4 Requests for disclosure of records. 1503.5 Disclosure of requested records.

1503.6 Special procedure: Medical records. 1503.7 Requests for amendment of records.

1503.7 Requests for amendment of rec 1503.8 Board review of requests for amendment of records.

1503.9 Appeal of initial adverse

determinations on access or amendment.

1503.10 Disclosure of a record to a person other than the individual to whom it pertains.

1503.11 Fees. 1503.12 Exception.

Authority: 5 U.S.C. 5528; 12 U.S.C. 1441a(a)(2); 12 U.S.C. 1441a(a)(13).

§ 1503.1 Purpose and scope.

The purpose of this part is to establish regulations implemeting the provisions of the Privacy Act with regard to access to and review of personal information in systems of records maintained by the Board.

§ 1503.2 Definitions.

As used in this part, the following terms shall have the following meanings:

(a) Board means the Thrift Depositor Protection Oversight Board.

(b) Business day means any day other than a Saturday, Sunday, or legal Federal public holiday.

(c) Guardian means the parent of a minor individual or the legal guardian of an individual who has been declared to be incompetent due to physical or mental incapacity or age by a court of competent jurisdiction.

(d) Individual means a natural person who is either a citizen of the United States or an alien lawfully admitted for permanent residence.

(e) Maintain means maintain, collect, use, disseminate, or control.

(f) Privacy Act means the Privacy Act of 1974, as amended, 5 U.S.C. 552a.

(g) Privacy Officer means an officer or employee of the Board designated by the President of the Board to implement the Privacy Act in accordance with this part.

(h) Record means any item, collection, or grouping of information about an Individual maintained by the Board that contains his or her name, or the identifying number, symbol, or other identifying particular assigned to the Individual.

(i) Routine use means, with respect to the disclosure of a record, the use of such record for a purpose which is compatible with the purpose for which it requirements of paragraph (b) of this was collected or created.

(j) System of records means a group of any records under the control of the Board from which information is retrievable by the name of the individual or some identifying number, symbol, or other identifying particular assigned to the individual.

(k) Vice President means a Vice
President of the Board designated by the
President of the Board to review actions
and determinations of the Privacy
Officer and to take action on behalf of
the Board with respect to appeals under
this part.

§ 1503.3 Procedures for determining if an individual's records are contained in a system of records.

(a) An individual or his or her guardian desiring to know if a specific system of records maintained by the Board contains a record pertaining to such individual shall address an inquiry in writing to the Privacy Officer, Oversight Board, 1777 F Street, NW., Washington, DC 20232. The written inquiry shall:

(1) Identify the system of records maintained by the Board or reasonably describe the type of record in sufficient detail to permit the Privacy Officer to identify an existing system of records;

(2) Identify the individual making the inquiry or on whose behalf the inquiry is made. The Privacy Officer may require such information concerning the identity or authority of an individual or guardian as the Privacy Officer deems appropriate, as provided under § 1503.4(b).

(b) The Privacy Officer shall ordinarily inform an inquirer whether a system of records described in the written inquiry contains a record pertaining to an individual within ten business days following receipt of the inquiry. If the Privacy Officer is unable to respond to a written inquiry within ten business days following its receipt, the Privacy Officer shall inform the inquirer of the reasons for delay and the anticipated date of response.

(c) An affirmative response shall describe or reference the procedures to be followed in order to gain access to a record.

§ 1503.4 Requests for disclosure of records.

(a) Requests by or on behalf of an individual for access to records pertaining to such individual in a system of records shall be submitted in writing to the Privacy Officer, Oversight Board, 1777 F Street, NW, Washington, DC 20232, in accordance with the

requirements of paragraph (b) of this section. The written request may be mailed, or presented in person on a business day between 9 a.m. and 5 p.m. to the Privacy Officer at the offices of the Board specified in the preceding sentence. The written request and the envelope (if the request is mailed) shall be clearly marked "Privacy Act Request." Notwithstanding the first sentence of this paragraph (a), an individual employed by the Oversight Board is not required while so employed to request access to his or her records in writing.

(b) Each written request shall be dated and signed and shall include:

(1) The name, address, and telephone number of the person signing the request;

(2) The name, address, and telephone number of the individual to whom a requested record pertains, if such individual is not the person signing the request;

(3) Verification of identity, by providing a document, such as a photocopy of a driver's license, bearing the signature of the person signing the request.

(4) Certified or authenticated copies of documents establishing parentage or guardianship if the request is made by the guardian of the individual to whom the requested record pertains;

(5) A statement that the individual whose records are requested is a citizen of the United States or an alien lawfully admitted for permanent residence in the United States;

(6) The name and location of the system of records in which the requested records are contained; and

(c) An individual who appears in person at the offices of the Board to submit a written request for access to his or her records shall present two forms of identification, such as a driver's license, birth certificate, or employment identification card, sufficient to establish his or her identity.

(d) Unless a requested record is publicly available pursuant to the Preedom of Information Act, 5 U.S.C. 552, the Privacy Officer may require certification by a notary public attesting to the identity of a requesting individual or other evidence establishing the identity of the requesting individual as a condition of making available or releasing a copy of a record pertaining to such individual. If a request is made by a guardian, the Privacy Officer may require appropriate evidence of authority to act on behalf of the individual whose records are requested.

(e) Requests by or on behalf of an individual for an accounting made

pursuant to 5 U.S.C. 552a(c) of previous disclosures of records pertaining to such individual in a system of records shall also be made and processed in accordance with paragraphs (a) through (d) of this section.

§ 1503.5 Disclosure of requested records.

(a) The Privacy Officer shall ordinarily respond to a request for access to records or an accounting of previous disclosures within ten business days following receipt of a request. If the Privacy Officer is unable to respond within ten business days following receipt of a request, the Privacy Officer shall inform the requester within ten business days following receipt of a request of the reasons for delay and the anticipated date of response.

(b) The Privacy Officer, in responding to a request for access to records, shall

inform the requester:

 Whether or not a requested record is maintained by the Board in a system of records;

(2) Whether or not access will be

granted;

(3) If access is granted, of a reasonable time, place, and procedure for providing access to and copies of the requested records;

(4) Of any fees that may be required

pursuant to § 1503.11;

(5) Of any additional information that may be required as a condition of granting access; and

(6) If access to a record is denied, the reason or reasons for denial and the procedures for obtaining a review of such denial.

(c) The requester of records may be accompanied in the inspection and discussion of such records by a person chosen by the requester, provided that the requester submits a written and signed statement authorizing the presence of such person during such inspection and discussion.

§ 1503.6 Special procedure: Medical records.

Medical records requested pursuant to § 1503.4 will be disclosed to the requester unless the disclosure of such records directly to the requester, in the judgment of the Privacy Officer, could have an adverse effect upon the requester. In such case, such information will be forwarded to a licensed physician named by the requester.

§ 1503.7 Requests for amendment of records.

(a) An individual or his or her guardian may request amendment or correction of records pertaining to such individual in accordance with the requirements of this section. Such

request shall be in writing and shall be submitted to the Privacy Officer, Oversight Board, 1777 F Street, NW., Washington, DC 20232, by mail, or in person on a business day between 9 a.m. and 5 p.m. The written request and the envelope (if the request is mailed) shall be clearly marked "Privacy Act Record Amendment."

(b) Each request shall be dated and

signed and shall:

(1) Identify the system of records containing the record for which amendment or correction is requested;

(2) Specify the record requested to be

amended or corrected;

(3) Specify requested additions and deletions;

(4) State the reasons for each requested amendment or correction, with appropriate supporting information or documentation; and

(5) Identify the requester, referring specifically to any previous written request for access submitted pursuant to § 1503.4 or providing the documentation concerning the individual and his or her guardian required by § 1503.4(b).

(c) An individual who appears in person at the offices of the Board to submit a written request for amendment or correction of his or her records shall present two forms of identification such as a driver's license, birth certificate, or employment identification card, sufficient to establish his or her identity.

(d) The Privacy Officer may require additional evidence of the identity or

authority of the requester.

(e) This section does not authorize or permit collateral attack upon the results or findings of a previous judicial or administrative proceeding.

§ 1503.8 Board review of requests for amendment of records.

(a) The Privacy Oficer shall acknowledge in writing the receipt of a request made pursuant to § 1503.7 within ten business days of such receipt. Such acknowledgement may include a request for additional information necessary for a decision concerning the requested amendment of a record.

(b) The Privacy Officer shall promptly review each request made pursuant to \$ 1503.7 in light of relevant criteria of the Privacy Act, including, but not limited to, 5 U.S.C. 552a(e) (1) and (5).

(c) Upon completion of such review, the Privacy Oficer shall direct amendment of the record as requested, giving notice of such action to the requester, or immediately notify the requester that the request for amendment of a record is denied. If an accounting of disclosures of such record has been made pursuant to 5 U.S.C. 552(a)(c), any person or agency listed in

such accounting shall be informed of any amendment.

(d) If a request made pursuant to \$ 1503.7 is denied in whole or in part, the Privacy Officer shall inform the requester of the reasons for such denial, the procedures for obtaining a review of such denial, and the name and business address of the Vice President.

§ 1503.9 Appeal of initial adverse determinations on access or amendment.

(a) A requester may appeal the denial of a request made pursuant to § 1503.4 or § 1503.7 in accordance with the provisions of this section.

(b) An appeal shall be submitted in writing to the Secretary, Oversight Board, 1777 F Street, NW., Washington, DC 20232, within 60 days following issuance of notice of a denial. The written appeal and the envelope in which it is mailed shall be clearly marked "Privacy Act Appeal." The written appeal shall be dated and signed and shall:

 State clearly in summary form the request that was denied, attaching a copy of the Privacy Officer's notice of denial or giving the date of such notice; and

(2) Set forth the reasons why the requester believes that access to a record should be granted or a record should be amended.

(c) The Vice President shall complete review of an appeal and, with the advice of the General Counsel to the Board. make a final determination within 30 business days following the date on which review is requested unless, for good cause shown, the President of the Board extends such period. A requester shall be promptly notified of an extension of the review period and the reasons therefor. The Vice President shall promptly give notice to the requester of the determination to grant access to a record, to amend a record as requested, or to affirm an initial adverse determination.

(d) If on appeal a request for access to a record made pursuant to § 1503.4 is granted, the Vice President's notice shall provide the information described in § 1503.6(b) (3) and (4). If the initial denial of such request is affirmed, the Vice President's notice shall include a statement of the reasons for such determination and advise the requester of the provisions of the Privacy Act concerning judicial review of such determination, as set forth in 5 U.S.C. 552a(g).

(e)(1) If on appeal a request for amendment of a record made pursuant to § 1503.7 is granted, the Vice President shall direct amendment of the record as requested, and the Vice President's notice shall so inform the requester. If an accounting of disclosures of the record has been made pursuant to 5 U.S.C. 552a(c), any person or agency listed in the accounting shall be informed of the amendment.

(2) If the initial adverse determination of a request pursuant to § 1503.7 is affirmed, the Vice President's notice

(i) Confirm, amplify, or modify the statement of reasons given by the Privacy Officer for denial of the request;

(ii) Advise the requester of the rights to file with the Board a concise statement of the requester's reasons for disagreeing with the determination not to amend a record in accordance with the request, as provided by 5 U.S.C. 552a(d)(3); and

(iii) Advise the requester of the provisions of the Privacy Act concerning judicial review of the determination, as

set forth in 5 U.S.C. 552a(g).

(f) If a requester seeking amendment of a record ("disputed record") files a concise statement of disagreement pursuant to 5 U.S.C. 552a(d)(3) and paragraph (e)(2)(ii) of this section, a copy of such statement shall be provided by the Board to any person or agency to whom the disputed record is disclosed subsequent to the filing of the requester's concise statement of disagreement. If an accounting of previous disclosures of such disputed record has been made pursuant to 5 U.S.C 552a(c), a notation of the disagreement shall be provided by the Board to any person or agency listed in such accounting. If deemed appropriate by the President of the Board, a concise statement of the Board's reasons for not amending the disputed record shall also be provided to any person or agency to whom the disputed record is disclosed subsequent to the filing of the requester's concise statement of disagreement.

§ 1503.10 Disclosure of a record to a person other than the individual to whom it pertains.

(a) Except as provided in paragraph (b) of this section, the Board shall not disclose by any means of communication any record contained in a system of records to any person or agency except with the prior written consent of the individual to whom the record pertains or of his or her guardian.

(b) The restrictions on disclosure in paragraph (a) of this section do not

apply to disclosure:

(1) To those officers and employees of the Board who have a need for the record in the performance of their duties:

(2) Required under the Freedom of Information Act, 5 U.S.C. 552;

(3) For a routine use;

(4) To the Bureau of the Census for purposes of planning or carrying out a census or survey or related activity pursuant to the provisions of title 13, United States Code;

(5) To a recipient who has provided the Board with advance adequate written assurance that the record will be used solely as a statistical research or reporting record, the record to be transferred in a form that is not individually identifiable;

(6) To the National Archives and Records Administration as a record which has sufficient historical or other value to warrant its continued preservation by the United States Government, or for evaluation by the Archivist of the United States or the designee of the Archivist to determine whether the record has such value;

(7) To another agency or to an instrumentality of any governmental jurisdiction within or under the control of the United States for a civil or criminal law enforcement activity if the activity is authorized by law, and if the head of the agency or instrumentality has made a written request to the Board specifying the particular portion desired and the law enforcement activity for which the record is sought;

(8) To a person pursuant to a showing of compelling circumstances affecting the health or safety of an individual if, upon such disclosure, notification is transmitted to the last known address of

such individual;

(9) To either House of Congress, or, to the extent of matter within its jurisdiction, any committee or subcommittee thereof, any joint committee of Congress, or subcommittee of any joint committee;

(10) To the Comptroller General, or any of his authorized representatives, in the course of the performance of the duties of the General Accounting Office;

(11) Pursuant to the order of a court of competent jurisdiction; or

(12) To a consumer reporting agency in accordance with 31 U.S.C. 3711(f).

§ 1503.11 Fees.

(a) Records disclosed to requesters pursuant to the Privacy Act and this part shall be duplicated at a cost of \$0.10 per page, except as follows:

(1) If the Privacy Officer determines that access to a record may be provided only by furnishing a copy of the record, no fee will be charged for the first copy of the record or any portion thereof;

(2) If duplication fees do not exceed \$2 for one request, the fees will be waived; and

(3) If the Privacy Officer determines it to be in the public interest, the Privacy Officer may waive any duplication fees.

(b) Requesters will not be charged for

search or review of a record.

(c) If it is anticipated that duplication fees will exceed \$25, the requester shall be notified promptly, and processing of the request shall be suspended until an agreement to pay the requested fees has been provided by the requester.

§ 1503.12 Exception.

Nothing in this part shall allow access to any information compiled in reasonable anticipation of a civil action or proceeding.

Peter H. Monroe,

President.

FEDERAL TRADE COMMISSION

16 CFR Parts 19, 23, and 245

Request for Comments Concerning the Guides for the Jewelry Industry, the Guides for the Watch Industry and the Guides for the Metallic Watch Band Industry

AGENCY: Federal Trade Commission.
ACTION: Request for public comment.

SUMMARY: The Commission is requesting public comment on proposed revisions to the Commission's Guides for the Jewelry Industry, 16 CFR part 23, the Commission's Guides for the Watch Industry, 16 CFR part 245, and the Commission's Guides for the Metallic Watch Band Industry, 16 CFR part 19. The Jewelers Vigilance Committee, Inc., a jewelry industy trade association, has proposed the revisions in a petition to the Commission.

In addition, as part of the Commission's oversight responsibilities in reviewing rules and guides, the Commission has determined to ask questions about the costs and benefits of these guides and their regulatory and economic impact. These questions will assist the Commission in identifying rules and guides that warrant modification or rescission.

DATES: Written comments will be accepted until August 26, 1992.

ADDRESSES: Comments should be directed to: Secretary, Federal Trade Commission, Washington, DC 20580. Copies of the petition, the current guides and a document comparing the two are

on the public record and can be viewed in or obtained from the Public Reference Section, room 130, Federal Trade Commission, 6th and Pennsylvania Avenue, NW., Washington, DC 20580, FOR FURTHER INFORMATION CONTACT: Susanne S. Patch, Attorney, Federal Trade Commission, room S-4631, 601 Pennsylvania Ave., NW., Washington DC 20580, Telephone: 202/326-2981. SUPPLEMENTARY INFORMATION:

I. Background

The Jewelers Vigilance Committee, Inc. (JVC), a voluntary, non-profit association formed to advance ethical practices in the jewelry industry, has petitioned the Federal Trade Commission to revise the Guides for the Jewelry Industry, 16 CFR part 23 (1992), and other related guides. The Guides were last substantively revised in 1959. Before the Commission determines whether the Guides should be revised and, if so, what revisions should be made, it seeks comment from all

Interested persons.

The JVC petition is a 71-page
document comprised of several letters
from JVC officials, an introductory
statement and the text of the Jewelry
Guides, as the JVC proposes that they
appear in the Code of Federal
Regulations. The JVC petition proposes
incorporation of the Commission's
Guides for the Metallic Watch Band
Industry, 16 CFR part 19 (1992), and the
Guides for the Watch Industry, 16 CFR
part 245 (1992), with the Guides for the
Jewelry Industry. The petition further

proposes that the text of five voluntary product standards formerly administered by the Bureau of Standards of the U.S. Department of Commerce (now the National Institute of Standards and Technology) be incorporated into the Jewelry Guides. These standards are at present only referred to in the Guides.³

The proposed revisions fall into seven categories, as follows: Jewelry industry products in general; precious metals and pewter; diamonds, genuine and imitation; pearls, genuine, cultured and imitation; gemstones, genuine, synthetic and imitation; watches and permanently attached watch bands; and detachable metal watch bands. The current guides set out industry standards for many of these products. The JVC proposal adds guides concerning standards for products not currently covered, such as "vermeil," "pewter" and "platinum filled."

The petition describes new methods of gem treatment or "enhancement" and proposes that these treatments (e.g., concealing flaws and cleavage cracks in diamonds), be disclosed to the purchaser.

Most proposed changes are addressed in the "Request for Comment" part of this notice. Other changes are proposed in the following subject areas:

Misrepresentation of the character or identity of business, parts of jewelry that are exempt from quality-marking requirements, application of trademarks to quality-marked platinum, and prohibition of the term "blue-white" as descriptive of diamond color.

The Commission is interested in comments on any or all of the proposed revisions and the other issues posed by the Commission. Specific questions appear below, and where appropriate, the question is accompanied by a citation to the pertinent part of the guides. The Commission also advises interested members of the public that, if retained, in addition to any revisions identified in this Notice that are deemed appropriate, the legal discussion in the guides will be updated to reflect the Commission's current practices.

¹ This document is on the public record and available for inspection. Copies also may be requested from Commission staff. In addition, staff has prepared a document showing how the current guides would be changed by the JVC proposal. Deletions are identified by strike-throughs. This document cannot be reproduced in the Federal Register, but it is on the public record and copies are available upon request.

The major areas of revisions proposed by the JVC are discussed briefly in this announcement. In some places, most notably in § 23.5, staff has partly restructured the JVC proposals, but has made no substantive changes. Many of the proposed revisions are the subject of a specific request for comment. See Part II. A few questions pertain to issues of interest to staff that were not raised by the JVC. Interested persons are encouraged to obtain either or both the petition and the comparison document to review all the proposed revisions. Comment on any or all proposed revisions, whether or not there is a specific request for comment, is encouraged.

² The JVC proposes omitting current Watch Guides 11 through 16. These are guides covering areas that were deleted from the Guides for the Jewelry Industry in 1978 when the Jewelry Guides [but not the Watch Guides] were being reviewed. The titles of the omitted guides are: "Deceptive Pricing"; "Commercial Bribery"; Coercing Purchase of One Product as a Pre-requisite to the Purchase of Other Products"; "Misrepresentation of the Character and Size of Business, Extent of Testing.

etc."; "Guarantees, Warranties, etc."; and "Use of the Word 'Free'." This material is covered in other FTC guides of general application. Following each request for comment there appears, where appropriate, a citation to the pertinent part of the guides.

II. Request for Comment

- 1. Have the current guides had a significant economic impact (costs or benefits) on entitles subject to their requirements?
- 2. Is there a continuing need for the guides?
- 3. What burdens does compliance with the guides place on entities subject to their requirements?
- 4. What changes should be made to the guides to minimize the economic effect on such entities?
- 5. Do the guides overlap or conflict with other federal, state, or local government laws or regulations?
- Has technology or have economic changes since the guides were issued had an effect on the guides? Please specify.
- 7. The JVC petition proposes stating that, if an industry product is described as "certified," a certificate be available to the purchaser that discloses the name of the certifier and the matters and qualities certified. Should the guides include such a provision? If so, why? If not, why not? If gemstones are among the items certified, should the guides also require such a certificate to disclose the degree of subjectivity present in diamond and colored stone grading and valuing? Section 23.1(c).
- 8. Should the guides, as the JVC proposes in § 23.1 (d) through (f), require, in the sale of gemstones as investments, the disclosure that appreciation or profit cannot be assured, that no organized market exists for resale of these gemstones by private owners, and that the seller is in compliance with all applicable laws and regulations governing securities dealers? Should the use of such terms as "investment gem," "investment grade," or "investment quality" to imply a quality superior to that of gemstones marketed for use in jewelry be prohibited? Should limiting a purchaser's ability to examine any industry product by delivering the product in a sealed container under a warranty that becomes void if the seal is broken be prohibited? Can the Commission expect voluntary compliance with such requirements?
- 9. Should the guides be expanded to include appraisals of jewelry in addition to sales and offers to sell jewelry?

³ The specific standards are: PS 87-76, Marking of Gold filled and Rolled Gold Plate Articles Other Than Watch Cases; PS 68-76, Marking of Articles Made of Silver in Combination with Gold: PS 69-76, Marking of Articles Made Wholly or in Part of Platinum; PS 70-76, Marking of Articles made of Karat Gold; and PS 71-76, Marking of Jewelry and Novelties of Silver.

^{*} For example, the references to "it is an unfair trade practice" would be deleted and other pertinent language revised to conform to the deception standard formulation as expressed in the

Commission's 1983 Statement on Deception. See appendix to Cliffdale Associates, 103 F.T.C. 110, 174 (1984).

10. Should standards for the gold or silver content of pens, pencils and optical products be the same as current standards for jewelry, as described in proposed § 23.5 C(1) and proposed § 23.6, Section I(b)? Should a standard for these products be included at all in

the guides?

11. "Gold plate" historically is a general term covering all gold plate, however applied. The trade appears to use the term as descriptive of gold electroplate only. The current guides, however, in § 23.5(b)(4), limit its use to mechanically plated gold. Please comment on how gold plate should be defined in the guides.

12. Are there newer methods of plating gold that should be included in the guides? If so, describe those methods and how they should be addressed in

the guides.

13. Should the guides amend the standard for gold-filled jewelry to prohibit the insertion of nickel between the gold-filled item and the surface coating of gold electroplate, as the JVC proposes in § 23.5C(2), Footnote 2? Would it be acceptable to permit the insertion of nickel so long as the lessened durability of such an item is disclosed? If so, what type of disclosure should be made and in what manner?

14. Is the proposed standard of a plating of 120 millionths of an inch of fine gold, or its equivalent, over sterling appropriate for "vermeil." described in

§ 23.5D?

15. The term, "substantial thickness," as applied to silver plate in the Note to § 23.6(e) is defined as "durable." Should the thickness of the coating be defined

in numerical terms?

16. The proposed guides reduce the minimum amount of platinum in articles (without solder) marked "platinum" from 985 parts in a thousand to 950 parts. Is the proposed minimum, as specified in § 23.7 B and C, appropriate? If so, why? If not, why not?

17. Should a standard be established for a product described variously as "platinum-filled," "platinum overlay" or "platinum clad?" If so, is the standard proposed in § 23.7D, that the platinum plating constitute at least ½oth of the weight of the entire article, appropriate?

18. What is the industry standard for solder-filled platinum chain? Is the standard of 850 parts per thousand pure platinum, as proposed in § 23.7E, an appropriate standard? Should the Guides state that marking the platinum content on an item without disclosing the name or U.S.-registered trademark of the company responsible for the accuracy of the mark is deceptive?

19. Should the guides include a standard for pewter? If so, is the

standard (any alloy consisting of at least 900 parts per thousand Grade A Tin) proposed in § 23.7A appropriate?

20. Should the guides prohibit the term "perfect" as a synonym for "flawless" in describing diamonds? Proposed § 23.10(1) limits this use of perfect but does not prohibit it.

21. Should the use of "points" to describe diamond weights be limited to oral representations as proposed in § 23.16? If so, why? If not, why not?

22. Should the guide require items containing one or more diamonds to be marked with the minimum weight of the diamond or diamonds as described in § 23.16 (f) and (g)?

23. Should the guides, as set out in § 23.20(a), prohibit the use of the term "gemstone" as descriptive of snythetic or imitation products? If so, why?

24. In addition to disclosing gemstone enhancement (see § 23.20(c)), should sellers be required to disclose to consumers in writing any special care requirements? If so, should specific disclosures be identified in the guides? Also, should the method of disclosure be specified?

25. Should the term "semi-precious" be prohibited in conjunction with gemstones, as proposed in § 23.23(b)?

26. Should foreign words or phrases like "faux" be added to the list of terms in § 23.24(b) that are not to be used to describe industry products?

27. Is the proposed standard of ¾ of 1,000th of an inch of 10K gold or better over a base of sterling silver for "vermeil" watchcases appropriate? See § 23.25C(1).

28. Comment is invited on the porposal in § 23.31 that any person who alters the name or any other feature of a brand name watch or opens a "water resistant" watch without authorization invalidates the warranty and must so inform the purchaser.

29. Should the metallic composition of all parts of watchcases be marked on the watchcase back as described in § 23.25?

30. Should the current definitions and tests for protective features of watchcases (e.g., water resistance, shock resistance) as described in § 245.5 be retained?

31. Should the Commission's Guides for the Metallic Watch Band Industry, 16 CFR part 19 (1991), and Guides for the Watch Industry, 16 CFR part 245 (1991), be consolidated into the Guides for the Jewelery Industry?

32. Are there any provisions setting forth particular requirements that do not accurately and fairly reflect the accepted customs, practices and patterns of dealing prevalent in the industry, including the terminology and

nomenclature customarily used in the course of trade? If so, please identify these provisions and describe the extent and effects of such differences in requirements.

33. Would any of the proposed changes to the guides result in: a lessening of competition among different segments of the industry, barriers to entering the industry, or increased prices to consumers?

34. Should the petition to revise be rejected and the current guides retained?

Authority: 15 U.S.C. 41-58.

DEPARTMENT OF TRANSPORTATION

Coast Guard

33 CFR Part 117

[CGD5-90-043]

Drawbridge Operation Regulations; Atlantic Intracoastal Waterway, Elizabeth River, Southern Branch, Chesapeake, VA

AGENCY: Coast Guard, DOT.
ACTION: Supplemental Notice of Proposed Rulemaking.

summary: The Coast Guard is issuing a revised proposed rule for the operation of the Jordan drawbridge across the Atlantic Intracoastal Waterway Southern Branch of the Elizabeth River, mile 2.8, in Chesapeake, Virginia. This change would allow commercial vessels carrying liquefied flammable gas or other harmful substances identified by commercial users of this waterway passage through the bridge at any time. This revised proposed rule also includes a provision that allows heavily laden cargo vessels, including tugs with tows, passage through the bridge during rush hours provided a 2-hour advance notice is given to the Jordan Bridge Office. This proposal is intended to provide for the safety of the public while providing regularly scheduled drawbridge openings.

DATES: Comments must be received on July 27, 1992.

ADDRESSES: Comments should be mailed to Commander (ob), Fifth Coast Guard District, 431 Crawford Street, Portsmouth, Virginia 23704–5004. The comments received will be available for inspection and copying at room 507 at the above address between 8 a.m. and 4 p.m., Monday through Friday, except Federal holidays.

FOR FURTHER INFORMATION CONTACT: Ann B. Deaton, Bridge Administrator, Fifth Coast Guard District, at (804) 398– 6222.

SUPPLEMENTARY INFORMATION:

Drafting Information

The drafters of this notice are Linda L. Gilliam, Project Officer, and LT Monica L. Lombardi, Project Attorney, Fifth Coast Guard District.

Regulatory History

The original proposal was published on July 27, 1990, in the Federal Register (55 FR 30723). It would have closed the Iordan Bridge to all vessels during morning and evening rush hours, Monday through Friday, except Federal holidays, from 6:30 a.m. to 7:30 a.m. and from 3:30 p.m. to 5 p.m. The Commander, Fifth Coast Guard District, also published the proposed rule as a public notice on August 2, 1990. Interested persons were given until September 10, 1990, to submit comments. The comment period for the public notice also ended September 10, 1990. Based on comments received, a public notice was issued on August 23, 1990, extending the comment period to October 10, 1990.

Discussion of Comments

As a result of the proposed rule and the public notice, comments were received from the maritime community and the motoring public. The motorists were all in favor of the proposed restrictions during peak traffic hours since elimination of draw openings during these hours would help reduce traffic disruption, delays, congestion and minor accidents. The commercial marine industry were opposed to restricting openings of the drawbridge to them based on economic impact concerns, safety and deep-draft vessel navigation requirements. The Coast Guard Marine Safety Office, Hampton Roads, commented in their memorandum dated October 9, 1990, that liquefied flammable gas carriers should be allowed passage through the Jordan Bridge any time with no restrictions due to the need for establishing safety zones and the risk and hazard involved in transporting a loaded liquefied flammable gas vessel.

As a result of these comments, a revised Proposed Rule was published in the Federal Register (56 FR 34046) on July 25, 1991, and the Commander, Fifth Coast Guard District, published the supplemental proposed rule as a public notice on July 31, 1991. The revised proposal included the original proposal with additional provisions which allowed commercial vessels with a draft of 22 feet or greater access through the bridge during morning and evening rush hours, provided they gave a 6-hour advance notice of their arrival, and liquefied flammable gas carriers access through the bridge any time with no restrictions. The decision to allow deep draft vessels access through the Jordan Bridge during peak traffic hours was based on these vessels requiring high tide to transit upstream from the bridge to commercial marine terminals where the channel depths are reduced to as little as 27 feet. Due to the hazards involved in shipping liquefied flammable gas, it was decided to allow liquefied flammable gas vessels unrestricted access through the bridge any time of the day. The comment period for the public notice and the proposed rule ended September 9, 1991. A supplement to the public notice was issued on September 5, 1991, extending the comment period to October 9, 1991, to allow the maritime industry more time to submit their comments.

Additional comments were received during the last comment period, and have been thoroughly considered by the Coast Guard. Specifically, comments from the motoring public remained the same; however, the maritime industry expressed further concern over the safety factor of transporting any harmful substance through this bridge and requested that the type of ships and harmful substances by extended to include all flammable products. Also, they requested that the 6-hour advance notice requirement for other commercial vessels be relaxed to 2 hours and include heavily laden cargo vessels, including tugs with tows.

Discussion of Proposed Rule

The International Federation of Professional and Technical Engineers, Local No. 10, requested that the regulations for this drawbridge be amended to eliminate all bridge openings during morning and evening peak highway traffic hours to help reduce highway traffic congestion, but remain open on signal during the rest of the time.

Currently, only pleasure boats are restricted from requesting bridge openings during morning and evening rush hours. The original notice of

proposed rulemaking would have closed the Jordan Bridge to commercial, recreational, and public vessels of the United States on Monday through Friday, except Federal holidays, from 6:30 a.m. to 7:30 a.m. and from 3:30 p.m. to 5 p.m. A provision that would allow the draw to open on signal at all times for vessels in distress was made a part of the proposal. This revision to the proposed rule exempts heavily laden cargo vessels, including tugs with tows, from the weekday morning and evening rush hour restrictions provided 2 hours advance notice is given to the Jordan Bridge Office. Commercial vessels transporting any flammable product (e.g., residual fuel, distillate fuel or gasoline) or other harmful substances (e.g., styrene monomer [white liquid used in processing plastic], phenol, and petroleum products) as well as vessels in distress and public vessels of the United States will be able to pass through the bridge any time. This proposed change closes the drawbridge to recreational vessels, and other commercial vessels that do not fall under the above categories from 6:30 a.m. to 7:30 a.m. and from 3:30 p.m. to 5 p.m., Monday through Friday, except Federal holidays. The rest of the time, the draw will open on signal. Imposing the 2-hour advance notice for certain vessels will provide motorists with an opportunity to learn about scheduled bridge openings for these vessels by radio broadcasts and any other means established by the bridge owner.

In developing the proposal, the Coast Guard considered all these views. However, the decision to exempt certain vessels from rush hour restrictions is based on the need to maintain safety along the Southern Branch of the Elizabeth River. This waterway is a busy thoroughfare for both recreational craft and marine traffic transporting fuel oil, gasoline, liquid natural gas, chemicals and other types of harmful cargoes. Restricting all commercial vessels during rush hours would force many different sizes and types of vessels to hold in the vicinity of the bridge. This would increase the chance of collision or allision, especially during periods of high winds, fog, rain or tidal fluctuations. The risk of damage to property or to the environment is a major concern and will be greatly reduced by permitting hazardous commercial traffic to pass during rush

Request for Comment

Public comments are requested on the liquefied flammable gas carrier and harmful substance carrier exemption, and the 2-hour advance notice requirement for heavily laden cargo vessels, including tugs with tows, to ensure that this proposal is both reasonable and workable. Persons submitting comments should include their name and address, identify the bridge and give reasons for their comments. Persons desiring acknowledgment that their comments have been received should enclose a stamped, self-addressed postcard or envelope. The Commander, Fifth Coast Guard District, will evaluate all communications received and determine a final course of action on this supplemental proposal. This rule may be changed based on comments received.

Regulatory Evaluation

These proposed regulations are considered to be non-major under Executive Order 12291 and nonsignificant under the Department of Transportation regulatory policies and procedures (44 FR 11034; February 26, 1979). The economic impact of the proposed regulation on commercial navigation or on any industries that depend on waterborne transportation should be minimal. Since the economic impact of this proposal is expected to be minimal, the Coast Guard certifies that, if adopted, it will not have a significant economic impact on a substantial number of small entities.

Small Entities

Under the Regulatory Flexibility Act (5 U.S.C. 601 et seq.), the U.S. Coast Guard must consider whether proposed rules will have a significant economic impact on a substantial number of small entities. "Small entities" include independently owned and operated small businesses that are not dominant in their field and that otherwise qualify as "small business concerns" under section 3 of the Small Business Act (15 U.S.C. 632). The Coast Guard will accept comments on the economic impact on small entities, in connection with the proposal for permanent regulations, and consider them at that time.

Federalism

This notice has been analyzed in accordance with the principles and criteria contained in Executive Order 12612, and it has been determined that the proposed rule will not raise sufficient federalism implications to warrant the preparation of a Federalism Assessment.

Environment

This rulemaking has been thoroughly reviewed by the Coast Guard and it has been determined to be categorically excluded from further environmental documentation in accordance with section 2.B.2.g.(5) of Commandant Instruction M16475.1B. A Categorical Exclusion Determination statement has been prepared and placed in the rulemaking docket.

List of Subjects in 33 CFR Part 117

Bridges.

Regulations

In consideration of the foregoing, the Coast Guard proposes to amend part 117 of title 33, Code of Federal Regulations to read as follows:

PART 117—DRAWBRIDGE OPERATION REGULATIONS

1. The authority citation for part 117 continues to read as follows:

Authority: 33 U.S.C. 499: 49 CFR 1.46; 33 CFR 1.05-1(g).

2. In section 117.997, paragraph (a) is revised to read as follows:

§ 117. 997 Atlantic Intracoastal Waterway, South Branch of the Elizabeth River to the Albermarie and Chesapeake Canal.

(a) The draw of the Jordan (S337) bridge, mile 2.8, in Chesapeake:

(1) Shall open on signal at any time for public vessels of the United States, vessels in distress and commercial vessels carrying liquefied flammable gas or other harmful substances.

2. From 6:30 a.m. to 7:30 a.m. and from 3:30 p.m. to 5 p.m., Monday through Friday, except Federal holidays:

(i) Need not open for the passage of pleasure craft or commercial vessels that do not qualify under subparagraph (ii) of this section.

(ii) Need not open for heavily laden cargo vessels, including tugs with tows, unless 2 hours advance notice has been given to the Jordan Bridge Office at (804) 545–4695.

(3) Shall open on signal at all other times.

Dated: May 28, 1992.

W.T. Leland,

Rear Admiral, U.S. Coast Guard Commander, Fifth Coast Guard District.

33 CFR Part 117

[CGD13 92-05]

Drawbridge Operations Regulation; Lake Washington, Washington

AGENCY: Coast Guard, DOT ACTION: Proposed temporary rule.

SUMMARY: At the request of the Washington State Department of Transportation (WADOT), the Coast Guard is considering a temporary change to the regulations governing the Evergreen Point Bridge (SR-520) across Lake Washington between Seattle and Bellevue, Washington. The temporary regulation would be in effect through summer of 1993. This change would insure safe operation of the drawspan while malfunctions of the operating mechanism are being diagnosed and repaired. This action should provide for the reasonable needs of navigation by allowing the bridge owner to provide limited opening for navigation during period of reduced vehicular traffic. Also, it should provide the time needed to return the draw to the closed position before the next period of peak vehicular traffic.

DATES: Comments must be received on or before July 13, 1992.

ADDRESSES: Comments should be mailed to Commander (oan), Thirteenth Coast Guard District, 915 Second Avenue, Seattle, Washington 98174—1067. The comments and other materials referenced in this notice will be available for inspection and copying at 915 Second Avenue, room 3410. Normal office hours are between 7:45 a.m. and 4:15 p.m., Monday through Friday, except holidays. Comments may also be hand-delivered to this address.

FOR FURTHER INFORMATION CONTACT: John E. Mikesell, Chief, Bridge Section, Aids to Navigation and Waterways Management Branch, (Telephone: (206) 553–5864).

SUPPLEMENTARY INFORMATION:

Interested persons are invited to participate in this proposed rulemaking by submitting written views, comments, data, or arguments. Persons submitting comments should include their names and addresses, identify the bridge, and give reasons for concurrence with, or any recommended changes in, the proposal. Persons desiring acknowledgment that their comments have been received should enclose a stamped, self-addressed postcard or envelope.

The Commander, Thirteenth Coast Guard District, will evaluate all communications received and determine a course of final action on this proposal. The proposed regulations may be changed in light of comments received.

Drafting Information:

The drafters of this notice are: John E. Mikesell, project officer, and Lieutenant Laticia J. Argenti, project attorney.

Discussion of the Proposed Regulations

The operating mechanism for drawspan of the Evergreen Point Bridge has been plagued with serious electrical malfunctions. In the interest of safety, the Coast Guard has granted WADOT and emergency departure from the operating regulations. WADOT has now asked that the change in regulations be extended until the problem has been diagnosed and the necessary repairs are made. If approved, the temporary regulation would require that the draw of the Evergreen Point Bridge open on signal from 11 p.m. to 2 a.m. Sunday through Friday and from 11 p.m. to 5 a.m. Friday through Sunday, if at least 12 hours advance notice is given. This mode of operation would allow WADOT to provide limited openings for navigation during periods of reduced vehicular traffic. Also, it would provide the time necessary to diagnose and repair any operational problems that might arise and to then return the draw to the closed position before the next period of peak vehicular traffic. It is anticipated that this temporary regulation would be in effect through summer of 1993, after which time the present regulation would be reinstated or a less restrictive regulation would be proposed.

Federalism Assessment and Certification

This action has been analyzed in accordance with the principles and criteria contained in Executive Order 12291, and it has been determined that the proposed rulemaking does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

Economic Assessment and Certification

These proposed regulations are considered to be non-major under Executive Order 12291 on Federal Regulation and nonsignificant under the Department of Transportation regulatory policies and procedures (44 FR 11034; February 26, 1979).

The economic impact of this proposal is expected to be so minimal that a full regulatory evaluation is unnecessary. The Evergreen Point Bridge has average 29.5 openings per year for vessels over the last five years. This level of activity is expected to remain fairly constant for the foreseeable future. Although some vessel operators may be inconvenienced during the span of temporary regulation, openings will still be provided on a daily basis. Pursuant to the Regulatory Flexibility Act (5 U.S.C. 601, et seq.), the Coast Guard certifies that, if adopted, the proposed regulations will not have a

significant economic impact on a substantial number of small entities.

Environmental Assessment and Certification

This action has been reviewed by the Coast Guard and has been determined to be categorically excluded from further environmental documentation under the authority of 40 CFR 1507.3 and in accordance with paragraph 2.B.2.g.(5) of the NEPA Implementing Procedures, COMDTINST M16475.1B. A copy of the Categorical Exclusion Certification is available for review on the docket.

List of Subjects in 33 CFR Part 117

Bridges.

Proposed Regulations

In consideration of the foregoing, the Coast Guard proposes to amend part 117 of title 33, Code of Federal Regulations as follows:

PART 117—DRAWBRIDGE OPERATION REGULATIONS

1. The authority citation for part 117 continues to read as follows:

Authority: 33 U.S.C. 499; 49 CFR 1.46; 33 CFR 1.05–1(g).

Section 117.1049 is amended by revising paragraphs (a) and (c)

§ 117.1049 Lake Washington.

(a) The draw shall open on signal for the passage of vessels from 11 p.m. to 2 a.m. Sunday through Friday and from 11 p.m. to 5 a.m. Friday through Sunday if at least 12 hours notice is given. At all other times the draw need not open.

(c) All non-self-propelled vessels, rafts, and other watercraft navigating this waterway which require an opening of the draw shall be towed by a suitable self-propelled vessel while passing through the draw.

Dated: June 3, 1992.

J. E. Vorbach,

Rear Admiral, U. S. Coast Guard, Commander, 13th Coast Guard District, [FR Doc. 92–13860 Filed 6–11–92; 8:45 am] BILLING CODE 4910–14–M

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 281

[FRL-4142-5]

The State of Louisiana; Proposal for Final Approval of State Underground Storage Tank Program

AGENCY: Environmental Protection Agency.

ACTION: Notice of proposal for final approval on application of Louisiana for final approval, public hearing and public comment period.

SUMMARY: The State of Louisiana has applied for final approval of its underground storage tank program under subtitle I of the Resource Conservation and Recovery Act (RCRA). The Environmental Protection Agency (EPA) has reviewed Louisiana's application and proposes that Louisiana's underground storage tank (UST) program satisfies substantially all of the requirements necessary to qualify for final approval. Thus, EPA proposes to grant final approval to the State to operate its program in lieu of the Federal program upon resolution of differences between Louisiana UST Regulations and the Federal UST Regulations. Louisiana's application for final approval is available for public review and comment and a public hearing will be held to solicit comments on the application, if requested.

DATES: A public hearing is scheduled for July 13, 1992. Louisiana will participate in the public hearing held by EPA on this subject. All comments on Louisiana's final approval application must be received by the close of business on July 13, 1992.

ADDRESSES: The Agency will hold a public hearing at 1:30 p.m. c.s.t. in the Maynard Ketchum Building, room 341 (Recital Room), 7290 Bluebonnet Street, Baton Rouge, Louisiana, 70810. Copies of Louisiana's final approval application are available for inspection and copying. 9 a.m. - 4 p.m. at the following addresses: Louisiana Department of Environmental Quality, Underground Storage Tank Division, 7290 Bluebonnet Street, Baton Rouge, Louisiana 70810, Phone: 504/765-0243; U.S. EPA Headquarters Library, PM 211A, 401 M Street, SW., Washington, DC 20460, Phone: 202/382-5926; and U.S. EPA. Region 6, Library, 12th Floor, 1445 Ross Avenue, Dallas, Texas 75202, Phone: 214/655-6444. Written comments should be sent to Samuel Coleman, Manager. Office of Underground Storage Tanks. U.S. EPA, Region 6, Mailcode: 6H-A,

1445 Ross Avenue, Dallas, Texas 75202, Phone: 214/655-6755.

FOR FURTHER INFORMATION CONTACT: Herbert R. Sherrow, Jr., Louisiana State Program Officer, Office of Underground Storage Tanks, U.S. EPA, Region 6, Mailcode: 6H-A, 1445 Ross Avenue, Dallas, Texas 75202, Phone: 214/655-

SUPPLEMENTARY INFORMATION:

A. Background

Section 9004 of RCRA enables EPA to approve State underground storage tank programs to operate in the State in lieu of the Federal underground storage tank program. Program approval is granted by EPA if the Agency finds that the State program: (1) Is "no less stringent" than the Federal program in the following seven elements: corrective action; financial responsibility; new tank standards; release detection; release detection recordkeeping; reporting of releases (section 9004(b)(2), 42 U.S.C. 6991c(b)(2)); and notification requirements of section 9004(a)(8), 42 U.S.C. 6991c(a)(8); and (2) provides for adequate enforcement of compliance with UST standards (section 9004(a), 42 U.S.C. 6991c(a)).

B. Louisiana

On October 15, 1991, Louisiana submitted an official application for final approval. Prior to its submission, Louisiana provided an opportunity for public notice and comment in the development of its underground storage tank program. This is required under 40 CFR 281.50(b). EPA has reviewed Louisiana's application, and has determined that there are apparent differences between Louisiana's regulations and federal regulations. The differences are in various sections of the Louisiana UST Regulations and involve minor aspects of variances; notification; owner/operator certification of installation, repair, and closure; specification of hazardous substances; and sampling procedures.

EPA and the State of Louisiana have discussed these differences and the State has agreed, pursuant to a Memorandum of Agreement (MOA) transmitted to the State on April 2, 1992, to amend its current regulations to address each instance of the differences noted above. The specific differences and Louisiana's proposed regulation changes are documented in the MOA. The MOA is available for review as a part of the State Program Approval

Application.

The State also agrees to provide documentation to EPA attesting to completion of the revisions and their adoption in accordance with the State's established rulemaking procedures. The State also agrees that all revisions are to become effective and enforceable in the State no later than July 20, 1992.

EPA proposes that Louisiana's program substantially meets all of the requirements necessary to qualify for final approval; therefore, following their mutual agreement on the terms and provisions of the MOA and the completion of the revisions to the Louisiana UST Regulations, EPA proposes to grant final approval to the State of Louisiana to operate its program in lieu of the Federal program.

In accordance with section 9004 of RCRA, 42 U.S.C. 6991c, 40 CFR 281.50e, the Agency will hold a public hearing on its proposal at the time and place indicated in the "ADDRESSES" section of this notice. The public may also submit written comments on EPA's proposal until July 13, 1992. Copies of Louisiana's application are available at the "ADDRESSES" indicated in this notice.

EPA will consider all public comments on its proposal received at the hearing or during the public comment period. Issues raised by those comments may be the basis for a decision to deny final approval to Louisiana. EPA expects to make a final decision regarding approval of Louisiana's program by September 10, 1992 and will give notice of it in the Federal Register. The notice will include a summary of the reasons for the final determination and a response to all major comments.

The State of Louisiana is not authorized to operate the UST program on Indian lands and this authority will remain with EPA.

Compliance With Executive Order 12291: The Office of Management and Budget has exempted this rule from the requirements of section 3 of Executive Order 12291.

Certification Under the Regulatory Flexibility Act: Pursuant to the provisions of 5 U.S.C. 605(b). I hereby certify that this approval will not have a significant economic impact on a substantial number of small entities. The approval effectively suspends the applicability of certain Federal regulations in favor of Louisiana's program, thereby eliminating duplicative requirements for owners and operators of underground storage tanks in the State. It does not impose any new burdens on small entities. This rule, therefore, does not require a regulatory flexibility analysis.

List of Subjects in 40 CFR Part 281

Acting Regional Administrator. [FR Doc. 92-13777 Filed 8-11-92; 8:45 am] BILLING CODE 6560-5-M

DEPARTMENT OF HEALTH AND **HUMAN SERVICES**

Office of the Secretary

45 CFR Part 5b

RIN 0925-AD31

Privacy Act; Proposed Exempt System

AGENCY: Office of the Secretary, HHS. ACTION: Notice of proposed rulemaking.

SUMMARY: The Department of Health and Human Services proposes to exempt a new system of records, 09-37-0021, "Public Health Service Records Related to Inquiries and Investigations of Scientific Misconduct, HHS/OASH/ OSIR", from certain requirements of the Privacy Act to protect records compiled in the course of scientific misconduct inquiries and investigations and to protect the identity of confidential sources in such investigations.

DATES: Comments on the proposed amendment must be received on or before July 13, 1992.

ADDRESSES: Written comments should be sent to: Carl C. Coleman, Director, Freedom of Information/Privacy Division, Office of the Assistant Secretary for Public Affairs, Room 645F, Hubert H. Humphrey Building, 200 Independence Avenue, SW. Washington, DC. 20201.

Comments will be available for public inspection at this address on Monday through Friday of each week from 8:30 a.m. to 5 p.m.

FOR FURTHER INFORMATION CONTACT: Barbara Bullman, J.D. (301) 443-5300.

SUPPLEMENTARY INFORMATION: The Office of Scientific Integrity Review (OSIR), established in the Office of the Assistant Secretary for Health, Public Health Service (PHS) is responsible for overall PHS policies and procedures for dealing with misconduct in science, for overseeing the activities of the PHS research agencies to ensure that these policies and procedures are implemented and for reviewing all final reports of investigations to assure that the findings and recommendations are

sufficiently documented. In addition, the Office of Scientific Integrity (OSI), a component of the Office of the Director, National Institutes of Health (NIH), is responsible for overseeing the implementation of all PHS policies and procedures related to scientific misconduct. This responsibility includes monitoring and conducting inquiries and investigations into alleged or suspected scientific misconduct.

The scientific misconduct inquiry and investigation records are located in the Office of Scientific Integrity Review; the Office of Scientific Integrity, PHS Agency Misconduct Policy Offices and PHS Agency senior intramural research managers' offices. The Public Health Service is preparing to organize and operate these records as a "system of records" as that term is defined by the Privacy Act. When PHS is prepared to organize and operate the records as a system and after the proposed rule is issued in final form, PHS will publish a notice of this new system in the Federal Register.

Under the Privacy Act, individuals have a right of access to information pertaining to them which is contained in a system of records. At the same time, the Act permits certain types of systems to be exempt from some of the Privacy Act requirements. For example, paragraph (k)(2) allows agency heads to exempt a system of records compiled in the course of an investigation of an alleged or suspected violation of law. This exemption is qualified in that if the material results in the denial of any right, privilege or benefit that the individual would be entitled to by Federal law, the individual must be granted access to the material unless the access would reveal the identity of a source who furnished information to the Government under an express promise of confidentiality. In addition, paragraph (k)(5) permits an agency to exempt material from the individual access provision of the Act where investigatory material is compiled for the purpose of determining suitability, eligibility or qualification for federal employment or financial assistance if release of the material would cause the identity of a confidential source to be revealed.

Since the OSI scientific misconduct inquiry and investigative files are records compiled for administrative and law enforcement purposes, the paragraph (k)(2) exemption is applicable. Moreover, since investigations of individuals alleged to have engaged in scientific misconduct may lead to determinations that such individuals are not suitable for appointment as special Government

employees or eligible for Federal grants or contracts from PHS agencies, the paragraph (k)(5) exemption is applicable.

In addition, often it is necessary in the course of investigations to give an express promise to withhold the identity of an individual who has provided relevant information. Sources of information necessary to complete an effective investigation may be reluctant to provide sensitive information unless they can be assured that their identities will not be revealed. These exemptions are proposed to maintain the integrity of the process and to ensure that the OSI's efforts to obtain accurate and objective information will not be hindered.

The exemptions will assure that the investigative files will not be disclosed inappropriately and that the identities of confidential sources will be protected. Accordingly, the Department proposes to exempt this system under paragraphs (k)(2) and (k)(5) of the Privacy Act from the notification, access, correction and amendment provisions of the Privacy Act (paragraphs (c)(3), (d), (e)(4)(G) and (H), and (f)). However, consideration will be given to requests for access, notification and corrections which are addressed to the system manager.

The Department has determined that the amendment to exempt part or all of a system of records from certain requirements of the Privacy Act is not a major rule within the meaning of Executive Order 12291, nor will it have a significant economic impact on a substantial number of small entities under the Regulatory Flexibility Act. Finally, the proposal does not impose any new information collection requirements within the Paperwork Reduction Act.

List of Subjects in 45 CFR Part 5b

Privacy.

Accordingly, The Department of Health and Human Services proposes to amend 45 CFR part 5b as set forth below:

Dated: September 24, 1991. James O. Mason,

Assistant Secretary for Health.

Approved: January 28, 1992.

Louis W. Sullivan,

Secretary, Department of Health and Human Services.

PART 5B—PRIVACY ACT REGULATIONS

1. The authority citation for part 5b continues to read as follows:

Authority: 5 U.S.C. 301, 5 U.S.C. 552a.

2. In part 5b, § 5b.11 is amended by adding paragraph (b)(2)(vii) as follows:

§ 5b.11 Exempt systems.

(b) * * *

(2) * * *

(vii) Pursuant to subsections (k)(2) and (k)(5) of the Act: Public Health Service Records Related to Inquiries and Investigations of Scientific Misconduct, HHS/PHS/OSIR.

[FR Doc. 92-13926 Filed 6-11-92; 8:45 am] BILLING CODE 4160-17-M

FEDERAL MARITIME COMMISSION

46 CFR Parts 550, 552, 553, and 555

[Docket No. 92-34]

Domestic Offshore Financial Filing Regulations; Exemption Under Section 35 of The Shipping Act, 1916

AGENCY: Federal Maritime Commission.
ACTION: Notice of Proposed Rulemaking.

SUMMARY: The Federal Maritime Commission proposes to amend its regulations pertaining to financial filing requirements for carriers in the domestic offshore trades. It is the intent of this proposal to eliminate part 553, which pertains to financial exhibits and schedules of non-vessel-operating common carriers ("NVOs") in the domestic offshore trades, and part 555. which specifies auditing procedures in the domestic offshore trades. A confidentiality provision in part 555 would be incorporated in part 552. which concerns financial reports of vessel-operating common carriers ("VOCCs"). Parts 553 and 555 no longer appear to serve a continuing regulatory purpose. Given the elimination of part 553, part 550 would be amended by adding an exemption for NVOs from the requirements of section 3 of the Intercoastal Shipping Act, 1993. Section 3, among other things, deals with Commission investigations and suspension of domestic offshore rate changes. The amendments would reduce recordkeeping and other regulatory requirements.

DATES: Comments due July 13, 1992.
Comments must be received at the
Commission by the due date; the date of
mailing will not be accepted as the filing
date in this proceeding.

ADDRESSES: Comments (original and 15 copies) are to be submitted to: Joseph C. Polking, Secretary, Federal Maritime

Commission, 1100 L Street, NW., Washington, DC 20573, (202) 523-5725.

FOR FURTHER INFORMATION CONTACT: Austin L. Schmitt, Director, Bureau of Trade Monitoring & Analysis, Federal Maritime Commission, 1100 L Street, NW., Washington, DC 20573, (202) 523– 5787.

SUPPLEMENTARY INFORMATION: 46 CFR part 553 prescribes the form and content of certain financial exhibits and schedules of NVOs in the domestic offshore trades and establishes the methodology that the Federal Maritime Commission ("Commission") would follow in evaluating proposed rate changes submitted by such NVOs subject to the provisions of the Intercoastal Shipping Act, 1933, 46 U.S.C. app. 843 et seq. ("1933 Act"). This part also provides for the retention and orderly acquisition of the data required for the methodology so established.

The regulations specify that the Commission will employ the operating ratio methodology when evaluating proposed rate changes by NVOs. Specifically, § 553.4 requires each NVO to maintain its records in such a manner as to permit the timely preparation of the exhibits and schedules that are to be filed in the event that the Commission institutes an investigation and hearing with respect to proposed rate changes. The Commission has not had reason to institute an investigation and hearing with respect to an NVO's proposed rate change in the 14 years since the rule was promulgated. Therefore, 46 CFR part 553 would not appear to be necessary given the costs associated with the requirements of § 553.4. In sum, 46 CFR part 553 imposes a burden on NVOs that appears to outweigh any identifiable benefits. Accordingly, the Commission proposes to relieve NVOs from these recordkeeping requirements by terminating part 553.

As a corollary to removal of these recordkeeping requirements, the Commission also proposes to exempt NVOs from the provisions of section 3 of the 1933 Act, 46 U.S.C. app. 845 and implementing regulations in title 46 CFR. Section 3 authorizes the Commission to suspend and investigate new and amended tariff matter filed by carriers, including NVOs, in the domestic offshore trades. Strict time limits are placed upon proceedings conducted under this section, and the carrier is required to refund any unsuspended portion of a general increase in rates found unjust and unreasonable.

Section 35 of the Shipping Act, 1916, 46 U.S.C. app. 833a, provides exemption authority as follows: The Federal Maritime Commission, upon application or on its own motion, may by order or rule exempt for the future any class of agreements between persons subject to this Act or any specified activity of such persons from any requirement of the Shipping Act, 1916, or Intercoastal Shipping Act, 1933, where it finds that such exemption will not substantially impair effective regulation by the Federal Maritime Commission, be unjustly discriminatory, or be detrimental to commerce.

Having found no cause to institute an investigation of NVO rates during the past 14 years, the Commission does not believe that exempting NVOs from the requirements of section 3 of the 1933 Act will substantially impair effective regulation, be unjustly discriminatory, or be detrimental to commerce.

Moreover, section 18 of the Shipping Act, 1916, 46 U.S.C. app. 817, provides a continuing basis for investigating the reasonableness of NVO rates in the domestic offshore trades, without the strict time constraints (and consequent recordkeeping requirements) imposed by section 3 of the 1933 Act. A proceeding under section 18 could be instituted by complaint or on the Commission's own motion and the NVO respondent in such a proceeding could be required to produce financial data in support of its rates. In addition, section 4 of the 1933 Act, 46 U.S.C. app. 845a, would continue to provide a right of reparation to complainants for rates found unjust or unreasonable under section 18.

46 CFR part 555 pertains to audits and auditing procedures in the domestic offshore trades and to those carriers who are required to file periodic reports with the Commission pursuant to 46 CFR part 552.* Part 555 establishes rules governing audits by Commission auditors of the books and records of carriers engaged in the domestic offshore trades of the United States and who are required to file periodic reports with the Commission pursuant to part 552 of this chapter. Section 555.5 provides for the confidentiality of the information obtained by the Commission.

No audits have been conducted under part 555 during the past 15 years.

Moreover, the critical regulation under this part, § 555.2, contains essentially the same audit and access to records language already contained in 46 CFR 552.4. These sections provide the Commission with access to all financial documents, records and working papers used by a carrier in preparation of the financial reports and exhibits submitted to the Commission under 46 CFR part 552. However, 46 CFR part 552 does not provide for confidentiality as does 46 CFR part 555. Considering the foregoing,

*Part 552 contains the requirements for financial reports of VOCCs in the domestic offshore trades.

the Commission proposes to terminate 46 CFR part 555, while incorporating its confidentiality provisions into 46 CFR 552.4

Although the Commission, as an independent regulatory agency, is not subject to Executive Order 12291, dated February 17, 1981, it nonetheless has reviewed the rule in terms of that Order and has determined that this rule is not a "major rule" as defined in Executive Order 12291 because it will not result in:

(1) Annual effect on the economy of \$100 million or more;

(2) A major increase in costs or prices for consumers, individual industries, Federal, State, or local government agencies or geographic regions; or

(3) Significant adverse effects on competition, employment, investment, productivity, innovations, or on the ability of United States-based enterprises to compete with foreign-based enterprises in domestic or export markets.

The Federal Maritime Commission certifies, pursuant to section 605(b) of the Regulatory Flexibility Act, 5 U.S.C. 605(b), that this rule will not have a significant economic impact on a substantial number of small entities, including small businesses, small organizational units and small government jurisdictions.

This proposed rule does not contain any collection of information requirements as defined by the Paperwork Reduction Act of 1980, as amended. Therefore, OMB review is not required.

List of Subjects

46 CFR Part 550

Maritime carriers, Reporting and recordkeeping requirements.

46 CFR Part 552

Maritime carriers, Reporting and recordkeeping requirements, Uniform system of accounts.

46 CFR Part 553

Freight forwarders, Maritime carriers, Reporting and recordkeeping requirements, Uniform system of accounts.

46 CFR Part 555

Confidential business Information, Maritime carriers, Uniform system of accounts.

Therefore, pursuant to 5 U.S.C. 553; 46 U.S.C. app. 812, 814, 815, 817, 820, 833a, 841a, 843, 844, 845, 845a, 845b, and 847, parts 550, 552, 553 and 555 of Title 46, Code of Federal Regulations, are proposed to be amended as follows:

PART 550—PUBLISHING, FILING AND POSTING OF TARIFFS IN DOMESTIC OFFSHORE COMMERCE

1. The authority citation for part 550 continues to read as follows:

Authority: 5 U.S.C. 553; 46 U.S.C. app. 812, 814, 815, 817, 820, 833a, 841a, 843, 844, 845, 845a, 845b, and 847.

Section 550.1 is amended by adding a new paragraph 550.1(c) to read as follows:

§ 550.1 Exemptions.

(c) Non-vessel-operating common carriers ("NVOs") providing transportation in domestic offshore commerce are exempt from the provisions of section 3 of the Intercoastal Shipping Act, 1933, 46 U.S.C. app. 845 and, thus, from the provisions of § 550.13 of this part. The reasonableness of NVO rates in domestic offshore commerce may be determined under the provisions of section 18 of the Shipping Act, 1916, 46 U.S.C. app. 817.

PART 552—FINANCIAL REPORTS OF VESSEL OPERATING COMMON CARRIERS BY WATER IN THE DOMESTIC OFFSHORE TRADES

1. The authority citation for part 552 continues to read as follows:

Authority: 5 U.S.C. 553; 46 U.S.C. app. 817(a), 820, 841a, 843, 844, 845, 845a and 847.

2. Section 552.4 is amended by adding a new paragraph 552.4(c) to read as follows:

§ 552.4 Access to and audits of records.

(c) All information obtained by the Commission or its duly accredited special agents or auditors as a result of an audit carried out pursuant to the provisions of this part shall be withheld from public disclosure and shall be treated as confidential information in the files of the Commission; except that any confidential information derived from an audit may be utilized by the Commission as the basis for a formal proceeding instituted pursuant to section 22 of the Shipping Act, 1916, and/or sections 3 and 4 of the Intercoastal Shipping Act, 1933, and may also be utilized in such a proceeding.

PART 553—FINANCIAL EXHIBITS AND SCHEDULES OF NON-VESSEL-OPERATING COMMON CARRIERS IN THE DOMESTIC OFFSHORE TRADES

1. Part 553 is removed.

PART 555—AUDITS AND AUDITING PROCEDURES IN THE DOMESTIC OFFSHORE TRADES

1. Part 555 is removed.

By the Commission.

INTERSTATE COMMERCE COMMISSION

49 CFR Part 1035

[Ex Parte No. 495]

Bills of Lading

AGENCY: Interstate Commerce Commission.

ACTION: Proposed rule; extension of comment due date.

SUMMARY: By decision served May 13. 1992, (57 FR 20442, May 13, 1992), the comment due date was extended to June 18, 1992. By petition filed May 29, 1992, The National Industrial Transportation League (NITL) requests an additional 90day extension to September 16, 1992, to file comments. NITL states that additional time is needed due to ongoing meetings between members of NITL and the Association of American Railroads and its members (collectively AAR). On April 14, 1992, AAR made a presentation to NITL's Data and Computer System Committee proposing certain changes to the front of the form of the rail bill of lading. Further discussion between NITL and AAR is scheduled for June 10, 1992, in Chicago, IL. NITL further states that the content of the bill of lading also may be the subject of further discussion at a meeting of its Executive Advisory Council in early July.

On June 3, 1992, AAR filed a statement in support of NITL's extension request.¹ On June 5, 1992, National Grain and Feed Association filed a reply in support of NITL's request for a 90-day extension. The extension request is reasonable and will be granted.

DATES: Initial comments are due on September 16, 1992.

ADDRESSES: Send a original and 10 copies of comments referring to Ex Parte No. 495 to: Office of the Secretary, Case Control Branch, Interstate Commerce Commission, Washington, DC 20423.

FOR FURTHER INFORMATION CONTACT: Richard B. Felder, (202) 927–5610. [TDD for the hearing impaired: (202) 927–5721].

Decided: June 9, 1992.

By the Commission, Sidney L. Strickland, Jr., Secretary.

Sidney L. Strickland, Jr.

Secretary.

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 17

RIN 1018-AB56

Endangered and Threatened Wildlife and Plants; Notice of Reopening of Comment Period on Proposed Designation of Critical Habitat for Six Endangered Forest Species From Guam

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Notice of reopening of public comment period on proposed designation of critical habitat.

SUMMARY: The U.S. Fish and Wildlife Service (Service) gives notice that the comment period for the proposed designation of critical habitat for six endangered forest species from Guam is reopened. The proposed rule was published on June 14, 1991 (56 FR 27486). The comment period was reopened from October 15, 1991, through October 31, 1991 (56 FR 51668), to obtain additional information on the economic impacts of the proposed designation. The Service believes the comment period should be reopened at this time based on the availability of an Environmental Assessment pertaining to the establishment of an overlay refuge on Guam and a request to reopen the comment period by the National Wildlife Federation.

DATES: Comments on the proposed designation of critical habitat for six endangered forest species from Guam must be submitted by July 15, 1992.

ADDRESSES: Information, comments or questions on the designation of critical habitat on Guam should be submitted to the Field Supervisor, Pacific Islands Office, U.S. Fish and Wildlife Service, 300 Ala Moana Boulevard, room 6307, P.O. Box 50167, Honolulu, Hawaii 96850, Materials pertaining to the proposed designation of critical habitat will be available for public inspection during

AAR also requests the Commission to bifurcate the proceeding and to seek comments on the use of a Negotiated Rulemaking to address concerns about the substantive terms included on the bill of lading. AAR's request for other relief will be considered in a further Commission order.

normal business hours, by appointment, at the above address.

FOR FURTHER INFORMATION CONTACT: Robert P. Smith, Field Supervisor, at the above Honolulu address (telephone 808/ 541–2749).

SUPPLEMENTARY INFORMATION:

Background

On June 14, 1991, (56 FR 27486), the Service proposed to designate critical habitat for six endangered forest species from Guam: The little Mariana fruit bat (Pteropus tokudae), Mariana fruit bat (Pteropus mariannus mariannus), Guam broadbill (Mviagra frevcineti), Mariana crow (Corvus kubaryi), Guam Micronesian kingfisher (Halcyon cinnamomina cinnamomina), and Guam bridled white-eye (Zosterops conspicillatus conspicillatus). On July 12, 1991 (56 FR 31902), the Service announced the scheduling of a public hearing on the subject proposal. The public hearing was held in Agana, Guam, on July 31, 1991. The public was asked to submit written comments and materials by August 13, 1991. Subsequent to that date, the Guam Uranao Resort Corporation requested the opportunity to submit additional information on the economic impacts of the proposed designation of critical habitat for consideration by the Service. The comment period was, therefore, reopened for two weeks on October 15, 1991, to accommodate this request (56

FR 51668). Since that date, the Service has prepared an Environmental Assessment for the establishment of an overlay refuge on Guam, and, on May 19, 1992, the National Wildlife Federation requested that the comment period be reopened, so that additional information on the proposed designation of critical habitat may be submitted for consideration. The Service believes that the Environmental Assessment for designation of an overlay refuge may contain additional information that should be reviewed and considered in the process of arriving at a final decision for designation of critical habitat on Guam. The National Wildlife Federation wishes to submit comments addressing the scope of the legal protection which will be accorded designated critical habitat for endangered species that are no longer present in the wild but which may be reintroduced.

The six species for which critical habitat has been proposed are found in the Mariana Islands in the western Pacific in the Territory of Guam; two species, the Mariana fruit bat and the Mariana crow, are also found on the island of Rota in the Commonwealth of the Northern Mariana Islands. All were listed as endangered on August 27, 1984, due to one or more of the following activities: Poaching, predation by the introduced brown tree snake, and habitat loss.

The proposed rule to designate critical habitat includes a total of 16,893 acres in

northern Guam and 7,669 acres in southern Guam. The land is primarily under Federal ownership, with a smaller percentage owned by the Government of Guam and private landowners.

Additional information and comments may be submitted through July 15, 1992, to the Service office in the ADDRESSES section.

National Marine Fisheries Service; Endangered Species; Application for Scientific Research Permit; Andre M. Landry, Jr., Co-Director, Institute of Marine Life Sciences, Texas A&M University, Galveston, Texas (P512)

Notice is hereby given that an applicant has applied in due form for a Scientific Research Permit to take an endangered species as authorized by the Endangered Species Act of 1973 (16 U.S.C. 1531–1543) and the National Marine Fisheries Service (NMFS) regulations governing endangered fish and wildlife permits (50 CFR part 217–222).

 Applicant: Andre M. Landry, Jr., Co-Director, Institute of Marine Life Sciences, Texas A&M University, P.O. Box 1675 California, San Diego, Galveston, Texas 77553

2. Type of Permit: Scientific Research.

3. Name and Number of Species:
100 Kemp's Ridley Sea Turtles,
Lepidochelys kempi
20 Hawksbill Sea Turtles,
Eretmochelys imbricata
2 Leatherback Sea Turtles,

Dermochelys coriacea
300 Green Sea Turtles, Chelonia
mydas

200 Loggerhead Sea Turtles, Caretta caretts

4. Type of Take: The applicant proposes to capture sea turtles of various species to investigate habitat preference, movement and migration, foraging patterns and the impacts of man's activities, such as dredging and habitat alteration, upon sea turtles. Capture methods covered by this permit would include: (1) Entanglement nets, (2) trawlsl; (3) haul seines; and (4) hand capture (via SCUBA). Once captured, individual turtles may be subjected to specific research procedures including: Tagging, weighing and measuring, blood sampling and fecal pellet collection in an effort to generate data for the purposes mentioned above.

BILLING CODE 3410-02-M

SUMMARY: Pursuant to the Federal Advisory Committee Act, 5 U.S.C. App., notice is hereby given that the National Institute of Standards and Technology Visiting Committee on Advanced Technology will meet on Wednesday, June 24, 1992, from 10:30 a.m. to 11:30 a.m. The Visiting Committee on Advanced Technology is composed of nine members appointed by the Director of the National Institute of Standards and Technology who are eminent in such fields as business, research, new product development, engineering, labor, education, management consulting, environment, and international relations. The purpose of this meeting is to fully examine and discuss FY 1994 budget planning information for the National Institute of Standards and Technology.

DATES: The meeting will convene June 24, 1992, at 10:30 a.m. and adjourn at 11:30 a.m on June 24, 1992.

ADDRESSES: The meeting will be held in room 5840, Department of Commerce, 14th and Constitution, Washington, DC 20230.

FOR FURTHER INFORMATION CONTACT:

Dr. Dale E. Hall, Executive Director, Visiting Committee on Advanced Technology, National Institute of Standards and Technology, Gaithersburg, Maryland 20899, telephone number (301) 975–2158.

SUPPLEMENTARY INFORMATION: The Assistant Secretary for Administration, with the concurrence of the General Counsel, formally determined on August 30, 1990, that portions of the meeting of the Visiting Committee on Advanced Technology which involve examination and discussion of the budget for the Institute may be closed in accordance with section 552(b)(9)(B) of title 5, United States Code, since the meeting is likely to disclose financial information that may be privileged or confidential.

5. Location and Duration of Activity: The applicant requests a permit for the period of 1 July 1992 through 30 September 1993. In-water research will consist of netting surveys and tagrelease-recapture and tracking experiments within the nearshore and estuarine waters of Texas and southwestern Louisiana.

Written data or views, or requests for a public hearing on this application should be submitted to the NMFS, U.S. Department of Commerce, 1335 East-West Highway, Silver Spring, Maryland 20910, within 30 days of the publication of this notice. Those individuals requesting a hearing should set forth the specific reasons why a hearing on this particular application would be appropriate. The holding of such a hearing is at the discretion of the Assistant Administrator for Fisheries. All statements and opinions contained in this application are summaries of those of the applicant and do not necessarily reflect the views of NMFS. Documents submitted in connection with the above application are available for review by interested persons in the following offices: Office of Protected Resources, NMFS, NOAA, 1335 East-West Highway, SSMC#1, room 8268, Silver Spring, Maryland 20910, (301/713-2289); and Director, Southeast Region, NOAA, National Marine Fisheries Service, 9450 Koger Boulevard, St. Petersburg, Florida 33702.

Dated: June 9, 1992. Nancy Foster,

Director, Office of Protected Resources. [FR Doc. 92-13886 Filed 6-11-92; 8:45 am]

BILLING CODE 3510-22-M

Endangered Species; Modification of Permit; Southwest Fisheries Science Center; Modification No. 3 to Permit No. 691

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Department of

On April 9, 1992, notice was published in the Federal Register (57 FR 12293) that an application for modification to Permit No. 691 has been filed by the Southwest Fisheries Science Center, NMFS P.O. Box 271, La Jolla, California 92038, to take endangered species as authorized by the Endangered Species Act of 1973 (16 U.S.C. 1531-1543) (ESA) and NOAA, NMFS, regulations governing endangered fish and wildlife permits (50 CFR parts 217-222).

This modification would allow the take of up to 900 olive ridley, 50 green, 75 loggerhead, 10 hawksbill, and 10 leatherback sea turtles to be captured, measured, tagged, and photographed. Up to 300 sea turtles may be stomach and blood sampled. The modification also proposes to extend the permit period from December 31, 1992, to December 30, 1993

Notice is hereby given that on June 9, 1992, as authorized by the provisions of the ESA, NMFS issued a modification for the above taking, subject to certain conditions set forth therein.

Issuance of this modification, as required by the ESA, is based on the finding that such modification (1) was applied for in good faith; (2) will not operate to the disadvantage of the endangered species which is the subject of the modification; and (3) will be consistent with the purposes and policies set forth in section 2 of the ESA. This modification was also issued in accordance with and is subject to title 50 CFR parts 220-222 of NMFS' regulations govening endangered species permits.

The original Permit and modification numbers 1, 2, and 3 are available for review in the following offices: Office of Protected Resources, NMFS, 1335 East-West Highway, Room 8268, Silver Spring, Maryland 20910, phone 301/713-2289; and Director, Southwest Region, NMFS, 501 W. Ocean Boulevard, suite 4200, Long Beach, California 90802-4213.

Dated: June 9, 1992.

Nancy Foster,

Director, Office of Protected Resources. National Marine Fisheries Service. [FR Doc. 92-13885 Filed 6-11-92; 8:45 am] BILLING CODE 3510-22-M

Marine Mammals; Permits

AGENCY: National Marine Fisheries Service (NMFS), NOAA, Commerce. **ACTION:** Issuance of Modification No. 1 to Scientific Research Permit No. 717.

SUMMARY: On Tuesday, March 31, 1992, notice was published in the Federal Register (57 FR 10887) that a request to modify Permit No. 717 had been submitted by Dr. Howard W. Braham, Alaska Fisheries Science Center, NMFS, NOAA, National Marine Mammal Laboratory, 7600 Sand Point Way, NE., Bldg. 4, Seattle, WA 98115, to recapture up to 100 California sea lions (Zalophus californianus) up to four times each per year, in order to recover data-recording instruments and to outfit the animals with new instruments.

Notice is hereby given that on June 4. 1992, as authorized by the provisions of the Marine Mammal Protection Act of 1972 (16 U.S.C. 1361-1407), and Regulations Governing the Taking and Importing of Marine Mammals (50 CFR

part 216), the National Marine Fisheries Service issued the requested modification to Permit 717 for the above activities subject to the Special Conditions set forth therein.

The modified Permit is available for review by interested persons in the following offices:

Office of Protected Resources, National Marine Fisheries Service, 1335 East West Highway, room 7330, Silver Spring, MD 20910 (301/713-2289);

Director, Alaska Region, National Marine Fisheries Service, 709 West 9th Street, Federal Bldg., Juneau, AK 99802 (909/586-

Director, Northwest Region, National Marine Fisheries Service, NOAA, 7600 Sand Point Way, NE., BIN C15700, Seattle, WA 98115 (206/526-6150); and

Director, Southwest Region, National Marine Fisheries Service, 501 West Ocean Blvd., Suite 4200, Long Beach, CA 90802-4213 (310/980-4016).

Dated: June 4, 1992.

Charles Karnella,

Acting Director, Office of Protected Resources, National Marine Fisheries Service.

National Telecommunications and Information Administration

[Docket No. 920532-2132]

Current and Future Requirements for the Use of Radio Frequencies in the **United States**

AGENCY: National Telecommunications and Information Administration (NTIA). Commerce.

ACTION: Notice of inquiry; Request for comments.

SUMMARY: NTIA is conducting a broadly-based investigation of future requirements for the use of the radio frequency spectrum in the United States. and technology trends that would impact use of the radio spectrum. Public comment is requested on issues relevant to such an investigation. Additionally, comments are requested on issues concerning International Telecommunication Union radio conferences, such as the 1992 World Administrative Radio Conference. After analyzing the comments, NTIA intends to issue a report on national spectrum requirements and technologies and use the information and analysis as the basis for more effective long-range planning for national spectrum management.

DATES: Comments should be filed on or before October 1, 1992, and Reply

Comments should be filed on or before December 1, 1992, to receive full consideration.

ADDRESSES: Comments and Reply Comments (6 copies) should be sent to: Office of Spectrum Management, NTIA, U.S. Department of Commerce, 14th Street and Constitution Avenue NW., room 4099, Washington, DC 20230, attention W. Russell Slye.Q02
FOR FURTHER INFORMATION CONTACT: W. Russel Slye, 202–377–1850, or Rob Haines, 301–261–8002, Office of Spectrum Management.

I. Introduction

1. In this Notice of Inquiry (Notice), the National Telecommunications and Information Administration (NTIA) requests broadly-based technical and marketplace information on spectrum requirements ¹ for different radio

¹ The term "spectrum requirement" as used herein means generally spectrum required or needed, under stated conditions, to support the

services and classes of users over the next ten years. We are requesting this information from users, manufacturers and service providers in the private sector, as well as users, system developers, and system managers in federal, state, and local governments. No person is required to supply specific information pertaining to the commenter, other than that necessary for self-identification, as a condition to NTIA's full consideration of the comment. NTIA intends to use the information we obtain in response to this Notice to develop more effective planning for U.S. spectrum management and to issue a report on national spectrum requirements.

2. Responses should include information on: New, currently unsatisfied spectrum requirements; current uses that will diminish with time; current uses of continuing or increasing dimensions; and future spectrum uses now in the early stages of formulation. Further, responses should include information on the amount of bandwidth and spectrum location required to satisfy various telecommunications needs. In most cases, this could be best stated in terms of the size of the user base by radio service, the estimated volume of information flow, the estimated amount of spectrum required, and the technical methods or procedures used to equate

stated spectrum requirement.

3. Responses should include information, if available, on how new, currently unsatisfied spectrum requirements are being met in other countries (if they are being met) as well as any other current or anticipated spectrum allocation decisions abroad which will impact upon U.S. decisions.

the telecommunications needs with the

4. Until recently, advancing technology has kept ahead of the demand for spectrum. As demand has increased, developing technology has resulted in radios that can perform the functions of earlier systems at higher, less used frequencies, or with decreased bandwidth at the same frequency. Moreover, advanced coding and spread spectrum techniques can permit multiple, concurrent uses of a single frequency band. Now, demand for spectrum is growing rapidly, from both expanded use of current services like digital cellular radio-telephone, and the development of new uses, such as personal communication systems (PCS), digital audio broadcasting (DAB), and advanced television (ATV). However,

the technical advances in spectrum conserving techniques needed to meet that demand may be pushing the limits of practicality, at least in the short term.

5. This Notice will week to identify

5. This Notice will week to identify major technical and marketplace trends affecting spectrum usage, including the increased demand anticipated for various services (such as mobile radio), and any associated increased requirement for spectrum; how the use of new spectrum-based systems will be implemented; and the extent to which certain current spectrum requirements can be satisfied using other transmission media. As discussed in detail below, we seek specific comments on these technical and marketplace issues.

6. In examining both private sector and government needs in this Notice. spectrum requirements for systems supporting national security operations will continue to have a high priority. NTIA will work closely with the U.S. military services and other federal government agencies involved in national security regarding spectrum requirements that are of a classified nature. Classified spectrum requirements will not be included in the report resulting from this Notice, but we anticipate that they will be available to NTIA for analysis and evaluation in cases where potential spectrum allocation or frequency sharing options may impact these requirements.

7. Although we are seeking technical information on spectrum requirements, we are not soliciting requests for specific frequencies to support a commenter's individual radio systems or networks. We also do not seek to reexamine the fundamental policy issues considered in the NTIA Spectrum Notice ² and addressed in the NTIA Spectrum Study. Responses to the questions in this Notice should, as much as possible, also take into account the decisions made at the February 1992 World Administrative Radio Conference

accomplishment of a goal, mission, or business function consistent with efficient and effective use of the spectrum.

² Comprehensive Policy Review of Use and Management of the Radio Frequency Spectrum. Notice of Inquiry, 54 FR 50.694 (1989) [hereinafter NTIA Spectrum Notice].

(WARC-92),4 and current proceedings 5 of the Federal Communications Commission (FCC) that may lead to domestic spectrum reallocation.

II. Background

A. NTIA's Telecommunications Role

8. The Communications Act of 1934 (the Act) 6 established the FCC and gave it the authority to assign frequencies to all radio stations in the United States, except for those belonging to the federal government. Under section 305 of the Act, the President is authorized to assign the frequencies to federal government stations. The President has delegated this authority to the Secretary of Commerce, who has in turn delegated it to the Administrator of NTIA.3 Section 2-401 of Executive Order 12,046 provides that "Ithe Secretary of Commerce shall serve as the President's principal adviser on telecommunications policies pertaining to the Nation's economic and technological advancement and to the regulation of the telecommunications industry." 8 Thus, NTIA, on behalf of the Secretary of Commerce, develops telecommunications policies in the overall national interest, rather than limiting its scope to the interests of federal government agencies. In coordination with the Department of State and the FCC, NTIA develops plans, policies and programs which relate to international telecommunications issues. NTIA conducts studies and evaluations concerning telecommunications research and development, and ensures that Executive Branch views on telecommunications matters are effectively presented to the Congress, the FCC, and the public.

4 Decisions of WARC-92, as detailed in the Finel Acts of the conference, will change portions of the International Telecommunication Union (ITU) Table of Frequency Allocations. The U.S. National Table of Frequency Allocations will also reflect appropriate revisions from WARC-92. International Telecommunication Union, Final Acts of the World Administrative Radio Conference (WARC-92) (1992) [hereinafter WARC-92 Final Acts].

Docket No. 90–314, 5 FCC Rcd 3995 (released June 28, 1990) [hereinafter PCS Docket]; Spectrum Efficiency in the Private Land Mobile Radio Bands in Use Prior to 1988. PR Docket No. 91–170, 6 FCC Rcd 4126 (released July 2, 1991).

6 47 U.S.C. 151 et seq.

B. Recent NTIA Spectrum Planning Efforts

9. NTIA recently completed a comprehensive study recommending fundamental changes to the existing spectrum management system in the United States. The NTIA Spectrum Study contains a number of proposals regarding planning for innovative uses of the spectrum and emphasized "the importance of long-range planning by the FCC and NTIA * * * to anticipate user needs and to avoid unnecessary conflicts among proposed uses." ⁹ The report also states that:

NTIA will move to open its process of managing federal government spectrum use to permit a greater degree of public participation * * *.10

When practical, NTIA will publicize, and seek public comment on, major new policy proposals that could significantly affect the private sector * * *.11

To aid in long-range planning through forecasting, NTIA and the FCC should draw expert input from their constituent users to attempt to predict spectrum requirements for five years, ten years, and beyond. Users should identify specific trends and new technologies * * *.12

NTIA and the FCC should seek to institute a coordinated, strategic, longrange planning process. A two- to five-year planning cycle should be established * * *.13

NTIA and the FCC should seek to modify [the block allocation system] in the next decade to increase flexibility.¹⁴

10. NTIA, on behalf of the Department of Commerce, is also required to "[d]evelop, in cooperation with the Federal Communications Commission, a comprehensive long-range plan for improved management of all electromagnetic spectrum resources."15 NTIA has published editions of the Long-Range Plan for Management and Use of the Spectrum (LRP) in 1986, 1988, and 1989.16 The later editions increasingly have emphasized goal, policies, and plans primarily for federal spectrum management processes because of a lack of detailed private sector information on spectrum requirements.

11. Several bills currently under consideration in Congress also address planning for the accommodation of emerging telecommunications technologies.17 These bills require that the Secretary of Commerce for the Assistant Secretary of Commerce for Communications and Information) meet twice a year with the Chairman of the FCC to conduct joint spectrum planning.18 The FCC and the Department of Commerce would also be required to submit a joint annual report to Congress on their joint spectrum planning activities, including recommendations for action developed pursuant to such activities.19

C. Strategic Long-Range National Planning and Spectrum Reform

12. NTIA has consistently advocated reform of the spectrum management process through greater use of flexible, market-based mechanisms and better long-range planning for spectrum management. These policy goals are closely related. Greater reliance on market incentives, through such reforms as competitive bidding for spectrum licenses ²⁰ and more flexibility for licensees to use and transfer spectrum, ²¹ can help to ensure that spectrum, a renewable but limited resource, is used most efficiently to serve user needs.

13. At the same time, improve planning by NTIA and the FCC can ease the transition from the current highly centralized U.S. management system to one that relies more on market principles, by permitting modification of existing spectrum allocations in an organized, non-disruptive way. In particular, such planning helps ensure that adequate spectrum will continue to be available for public safety needs, other non-commercial uses such as amateur radio and scientific research, and local, state, and federal government uses. Moreover, improved planning is essential for the U.S. government to represent effectively the interests of all U.S. spectrum users in international spectrum negotiations. Such planning is especially important to permit the presentation of consistent policies in

such forums as the new series of biennial World Administrative Radio Conferences recommended by the High Level Committee of the International Telecommunication Union (ITU). Thus, the long-range planning effort that this Notice supports can aid spectrum reform in the United States generally.

14. This Notice is thus a natural outgrowth of the recommendations of the NTIA Spectrum Study regarding planning, market-based spectrum management, and open interchange of information with the public, the ITU regulatory development processes (e.g., WARC-92), our earlier long-range planning efforts, and the interest in planning displayed by Congress. The information received in response to this Notice will be used to identify national spectrum requirements, identify technology trends that impact the use of the spectrum, and plan for the accommodation of new radio systems.22 The spectrum planning we contemplate will consider both the implementation of market-based and other innovative spectrum management techniques, and the changes to the traditional regulatory processes necessary to implement such techniques while maintaining effective regulatory oversight.

15. Based on the responses to this Notice and our own analysis, NTIA intends to prepare a "requirements study" to help identify national spectrum requirements and technology trends.23 The study will be prepared in consultation with the FCC,24 the Interdepartment Radio Advisory Committee (IRAC),25 and the Spectrum Planning Advisory Committee (SPAC).26 The "requirements" study will specify: (a) Anticipated national spectrum requirements, (b) a forecast of radiocommunication technology and trends, and (c) the future spectrum requirements that should be addressed

²² NTIA expects that this series of studies will be

supra note 3, at 5, where this group is called the

by the FCC and NTIA.27 Depending on the record that we obtain in this proceeding, we may undertake additional detailed investigations of the technical, policy, and economic factors affecting the potential of accommodating specific new radio services in the currently allocated frequency bands.

III. Areas of Inquiry

A. National Spectrum Requirements

16. Within this are of inquiry, NTIA solicits broadly-based technical and marketplace information concerning the future requirements for the use of the radio frequency spectrum in the United States, including requirements for systems that have international operations and implications. The specific information we seek for each group of radio services includes: How much spectrum does each require, and what are the technical methods or procedures used to calculate this requirement? When will any additional spectrum be required or excess be available for other uses? Are there any requirements limited to specific geographic areas? Can these requirements be satisfied in bands shared with other services and classes of users? For a given service, with which services or types of services can frequency resources not be shared? If no sharing is possible, why? Are there physical limitations that preclude the use of particular portions of the radio spectrum? What alternatives to spectrum use are available to meet a requirement? Responses should include information on new, currently unsatisfied spectrum requirements, current uses that will diminish with time, current uses of continuing or increasing importance, and future spectrum uses now in the early stages of formulation. The following paragraphs indicate specific additional information of interest to NTIA for each group of

1. Mobile and Mobile-Satellite Services

17. The mobile service is a "radiocommunication service between mobile and land stations, or between mobile stations." 28 This includes the

27 This report will provide a basis on which the by the NTIA Spectrum Study, supra note 3, at 169. conventional dispatch-oriented land-. maritime-, and aeronautical-mobile services and the newer public-switched operations like cellular radio and PCS. Mobile service is used by the federal, state, and local government sector for may purposes, including such critical areas as national defense, law enforcement, public safety, and air traffic control. The private sector uses the mobile service to satisfy a myriad of communications requirements, including specialized needs such as electronic news gathering, aeronautical passenger communications, and biomedical telemetry.

18. Although mobile radiocommunication applications have been in use for most of this century, only in recent years have we seen their tremendous growth. This expansion has been stimulated both by technological advances and by increased demand for mobile services. In comments on the NTIA Spectrum Notice, several organizations predicted serious spectrum shortfalls for mobile services in the near future.29 However, one organization commented that this shortage was more a perception than a reality, and that the lack resulted from resistance to the use of more efficient digital technologies.30 Some have also postulated that a part of any spectrum shortage can be attributed to undue regulatory constraints on how the spectrum can be used.31 The FCC itself has expressed concerns about the effects of its regulations on efficient spectrum use for mobile services and is presently investigating the elimination of certain regulatory constraints now imposed on the frequency bands below 470 MHz that are used by Private Land Mobile Radio Service (PLMRS) licensees.32

19. In the 1980s, mobile-satellite service technology advanced from initial concepts to practical system designs and service demonstrations. Now, in the early 1990s, successful implementation of the mobile-satellite service, in many different forms, is expected at the national and international levels. The

station in the mobile service not intended to be used

while in motion" [e.g., a base station or a repeater].

Joint Strategic Planning Council. 25 The IRAC is an advisory committee consisting of representatives from 20 federal government agencies and a liaison member from the FCC. The IRAC advises NTIA on spectrum-related matters and assists in the development of federal spectrum

policies and the assignment of frequencies to

²⁶ The SPAC is an advisory committee under the Federal Advisory Committee Act (FACA), 5 U.S.C.A. app. 2 §9 (Supp. 1992). SPAC consists of 15 members from the private sector and 4 members

from the federal government.

mobile-satellite service can support land, maritime and aeronautical operations (including personal communications). Systems using geostationary or low-Earth orbit (LEO) satellites are in place or being proposed to provide users with mobile service over most of the Earth's surface. The number of mobile-satellite service systems that are being proposed and developed indicates that this is a significant growth area with increased spectrum requirements. For example, the International Civil Aviation Organization (ICAO) assembly recently endorsed the move away from a purely terrestrial system for air traffic control to the satellite-based Future Air Navigation Systems (FANS).33

20. We seek comments on the future spectrum requirements for the mobile services. We are not requesting duplication of any spectrum requirements information associated with PCS that may have been recently supplied in the FCC's PCS Docket, supra note 5, as this information is available to NTIA. What categories (e.g., land, maritime, or satellite) require spectrum and how much do they require? When will any additional spectrum be required or excess be available? Do these requirements pertain to specific geographic areas? Are there physical limitations that preclude the use of particular portions of the radio spectrum? What alternate means to radio are available to meet this telecommunication requirement? Do these requirements include any additional features (e.g., need for priority and preemptive capabilities)? Would it be practical to reallocate spectrum to the general mobile service, thereby permitting accommodation of all categories of mobile user in the same bands? Would the general mobile service lead to greater and more uniform usage of mobile service spectrum and provide a stimulant for the development of new and innovative services? What are the requirements for support for mobile services involved in the national security mission, including weapons system requirements?

21. What effect will advances in services like cellular radio or personal communications services have on traditional dispatch land-mobile services? ³⁴ What are the implications

23. To what extent can satellites designed for the mobile services be used to meet requirements for remote telephone service? Can some of the current mobile service requirements for use of the High Frequency (HF) band for longer distance communications be satisfied by the mobile-satellite service? How much HF spectrum could be made available for other applications? How should INMARSAT spectrum requirements for the mobile-satellite service be factored into U.S. spectrum plans? To what extent can LEO satellite services share the same spectrum with geostationary satellite services? To what extent have WARC-92 decisions satisfied future needs for the mobilesatellite services? What is the impact of present allocation regulations upon efficient use of the mobile service frequency bands?

2. Fixed and Fixed-Satellite Services

24. The fixed service is "radiocommunication * * * between specified fixed points." 35 Major users of the fixed service in the United States include common carrier, private operational, auxiliary broadcast, and cable TV relay service users, and the federal government. The federal government uses a number of fixed service systems in its internal crosscountry voice and data communications systems; the military uses them for both tactical and strategic communications. In addition to operations in the microwave and higher bands, there are a number of continuing applications in the HF channels for single channel emergency and message communications. Alternatives to fixed

26. NTIA is seeking information on how much spectrum will be required for future fixed service operations. Can fixed service requirements migrate to higher frequency bands in the future? What types of applications are most likely at the higher frequencies and which cannot be moved to higher frequencies? What new modulation techniques are being developed for fixed service applications and what effect do these techniques have on bandwidth, channel capacity, and spectrum requirements?

27. NTIA is also seeking similar information on the future use of the fixed-satellite service. What effect does increased fixed-satellite service use have on fixed service use? What trends are there that affect the future use of the fixed-satellite service (e.g., voice, data, and video trends)? What are the trends concerning separate fixed-satellite service systems (e.g., PANAMSAT, Columbia) performing the same functions as INTELSAT's international communications satellites? What are future plans concerning very small

37 Note that under current PCC rules, unused

licenses must be returned to the FCC. See 47 CFR

21.303(b), 22.303, 23.49 (1991) for common carriers,

of WARC-92 decisions on the development of mobile services and future requirements? When will worldwide personal, mobile voice and data communications services become technically and economically feasible and widely available to the public? Information concerning the expected users of the service and the number of projected users is also requested.

^{22.} To what extent can mobile service requirements be satisfied in bands shared by several classes of users and by different services? With which services or types of services can frequency resources not be shared? If no sharing is possible, why? Are there any reasons for or benefits to restricting certain frequency bands to terrestrial mobile services, rather than sharing the band with the mobile-satellite service? If so, what frequency bands should be used in this manner?

point-to-point radiocommunications include land lines and satellite communications. In many telecommunications networks, fiber optic cables are replacing fixed point-to-point microwave systems, especially in and between city centers and other communications hubs and in areas where rights-of-way for cable laying can be inexpensively obtained.³⁶

^{25.} To what extent will alternative transmission media replace fixed microwave service? If such replacement occurs, what should be done with any unused frequencies? ³⁷ Could unused microwave bands allocated to the fixed service be geographically shared with other services in a practical manner? ³⁸ What factors tend to discourage the use of fiber optic cables as an alternative to microwave systems? What other trends are there that would affect the future use of the fixed service?

³³ International Civil Aviation Organization, Council Action on Recommendation 9/1 of the 1991 Air Navigation Conference (Dec. 11, 1991).

²⁴ These newer technologies are discussed in greater detail infra paras. 57–62.

which require FCC approval to discontinue service. See also 47 CFR 73.1750, 80.31, 87.35, 90.157, 94.53 (1991), respectively, for the broadcast radio services, the safety and special radio services, the aviation services, the private land mobile radio services, and the private operational-fixed

microwave service.

38 That is, could the replacement by fiber optic
cable in hubs allow sharing with other services that
could not be permitted in areas where microwave
systems are still required?

³⁵ NTIA Manual, supra note 28, § 6.1.1 at 6-5.

³⁶ National Telecommunications and Information Administration, U.S. Dep't of Commerce, Special Pub. No. 91–26, The NTIA Infrastructure Report: Telecommunications in the Age of Information 94– 97 (Oct. 1991).

aperture terminals (VSATs) used for data transmissions to central collection points and LEO satellites? Will teleports ³⁹ continue to develop, and if so, what will be the effect on the ability to geographically share the spectrum used by the fixed-satellite service? How will the use of alternative transmission media, such as submarine fiber optic cables, affect the spectrum requirements of the fixed-satellite service?

3. Broadcasting and Broadcasting-Satellite Services

28. Radio and telephone broadcasting is the spectrum use that most directly touches the American public. Virtually all Americans own or make use of broadcast radio and television receivers. Thus, any technical changes in the AM, FM or television broadcasting services potentially can affect almost all U.S. citizens and accordingly require very careful planning. The spectrum allocations for AM, FM, and television broadcasting have undergone several changes over the years. In 1974, the FCC reallocated 115 MHz of spectrum from broadcast to land mobile use.40 In addition, the FCC revised rules regarding UHF television channels 14-20 to allow broadcast/land mobile sharing.41 Recently the AM broadcast band was expanded by 100 kHz to include the 1605 kHz frequency range. 42

29. Furthermore, the FCC is currently considering significant changes to broadcast delivery systems, such as ATV in television and DAB in radio, that could affect future requirements for commercial broadcast spectrum. 43 With regard to ATV spectrum needs, the FCC has tentatively concluded that the UHF and VHF spectrum currently allocated for television broadcasting using the National Television System Committee (NTSC) standard will be used for ATV. 44 Furthermore, the FCC has

determined that most, perhaps all, existing full-serivce NTSC broadcasters can be accommodated using this spectrum, ⁴⁵ and that after a suitable transition period, the NTSC channels should be surrendered to the FCC. ⁴⁶

30. Similar spectrum use issues exist for the development and implementation of DAB in the United States. The broadcast industry is actively developing both "in-band" and "out-of-band" approaches for DAB, and the results of these development efforts will affect the range of feasible options available to the FCC in making spectrum management decisions to accommodate this new service. Moreover, recent actions at WARC-92 have focused increased attention on this technology 47

technology.47 31. Considering the requirements of new broadcast technologies such as ATV and DAB, are current allcoations for broadcast technologies sufficient? What is the likely impact of WARC-92 on availability of spectrum for DAB? Are there different requirements depending on whether the service is provided on a terrestrial or satellite basis? On the other hand, given the increasing demand for spectrum access in the major broadcast markets, and the transition to new, potentially more efficient broadcast technologies, will there be opportunities for greater flexibility or increased sharing in the use of broadcasting spectrum, particularly in the long-run?

32. The United States Information Agency, through the Voice of America, carries out HF radio broadcast operations in the United States, in addition to its other broadcast services, for audiences outside the United States. The Armed Forces Radio and Television Service, and a number of private sector broadcasters also have broadcast operations that reach audiences outside the United States. What are the future spectrum requirements for HF

broadcasting, both governmentsponsored and private?

33. Satellite-based television broadcasting is now being provided in Europe and in Japan. In the United States, the FCC has allocated and assigned spectrum for television from satellites and a number of proponents have plans to begin offering services in the near future. The large number of television receive-only (TVRO) systems in the United States indicates that consumers may be willing to pay for satellite broadcasting, particularly as the size of the antennas and overall prices of the systems are reduced. TVRO systems, however, currently receive television from satellites operating in the fixed-satellite service. not the broadcasting-satellite service. Spectrum requirements for satellite broadcasting may compete with spectrum requirements for other satellite-based radio services. NTIA thus seeks comments on the outlook for satellite-based broadcast systems, including television, audio, or other forms of broadcast services. What will be the total spectrum requirements in the next ten years for broadcastingsatellite services? Will the spectrum allocations for broadcasting established by WARC-92 be adequate in the long term? Are there domestic or international spectrum coordination concerns? Will broadcasting via satellite, either as a supplement to or replacement of HF broadcasting, be realized and will this affect HF needs?

4. Radiodetermination. Radiodetermination-Satellite, and Meteorological Aids Services

34. Radiodetermination is "the determination of the position, velocity and/or other characteristics of an object, or the obtaining of information relating to these parameters, by means of the propagation properties of radio waves." 48 The radiodetermination service includes radiolocation and radionavigation, with a wide variety of applications such as surveillance for enemy aircraft, missile tracking, target detection, weapon control, air traffic control, maritime navigation and aircraft altimeters. Although radiodetermination stations are predominantly radars, the service includes a number of non-radar systems such as LORAN-C, the Global Positioning System (GPS), and Glide Slope systems for aircraft. Radiodetermination bands are typically not shared with other services because the high power of most radar transmitters, the use of rotating or

³⁹ A teleport is a concentration of co-located Earth stations under a single management, usually operating in the fixed-satellite service.

Docket No. 90– 357, 5 FCC Rcd 5237 (released Aug. 21, 1990); Advanced Television Systems and Their Impact upon the Existing Television Broadcast Service, 6 FCC Rcd 7024, 7036 (1991) [hereinafter Advanced Television].

⁴⁴ See Advanced Television Systems and Their Impact upon the Existing Television Broadcast Service, Tentative Decision and Purther Notice of Inquiry, 3 FCC Rcd 6520 (1988).

⁴⁶ Advanced Television, supra note 43, at 7029.

⁴⁶ In addition, the FCC has tentatively concluded that it should not propose additional spectrum allocations for broadcast auxiliary purposes at this time; Advanced Television, supra note 43, at 7031.

⁴⁷ For ATV, the U.S. proposed a new broadcasting-satellite service allocation at 24.85–25.25 GHz to augment the current allocation at 12 GHz; U.S. Dep't of Stata, United States Proposals for the 1992 World Administrative Radio Conference for Dealing with Frequency Allocations in Certain Parts of the Spectrum 6 (1991) [hereinafter WARC–92 Proposals]. The WARC allocated 17.3–17.8 GHz for Region 2 and 21.4–22 GHz for Regions 1 and 3 for BSS, while deleting the allocation at 22.5–23 GHz; WARC–92 Final Acts, supra note 4, at 20, 24. For DAB, the WARC allocated 1452–1492 MHz, 2310–2360 MHz (in the U.S. and India), and 2535–2655 MHz (in several Asian and eastern European administrations); Id. addendum + corrigendum at 5–6, 20, 23.

⁴⁸ NTIA Manual, supra note 28, § 6.1.1 at 8-10.

scanning antennas, the mobility of the stations (e.g., on ships and aircraft), and the critical functions they perform (e.g., safety-of-life and military functions). However, sharing has been practicable for uses where interference from radars can be accommodated and interference to the radiodetermination stations will not occur (e.g., amateurs). NTIA seeks information on all future applications of

radar technology.

35. Many of the newer military airborne radars are capable of performing both radiolocation and radionavigation functions with the same signal through the use of complex signal processing techniques. These
"multifunction radars" are spectrum
efficient devices, since they perform the functions of at least two radars with only one signal. Do these multifunction radars point to a more general merging of functions? Should the radiolocation and radionavigation services continue to use separate frequency bands? Do multifunction radiodetermination systems require separate spectrum allocations? Is there a need to further define the radionavigation or the radiolocation services? What types of radio systems or services can share spectrum with radar systems? What conditions could be required? How should broadband (low-energy, impulsetype) radars be supported?

36. Radars are also used in the meteorological aids service to detect precipitation, wind speeds and wind gusts. Meteorological radars include weather radars at airports and meteorological forecast stations and those used in navigation aboard ships and aircraft. What effect will the current upgrading of the National Oceanic and Atmospheric Administration's weather forecasting system, in particular the use of the Next Generation Radar (NEXRAD) technology and the Wind Profiler radar systems, have on the

spectrum?

37. Uses of the radiodeterminationsatellite service (radiodetermination involving one or more spacecraft) 49 include spacecraft docking and Earthsurface mapping. What are the future spectrum requirements for space-based radar?

38. Some non-radar radionavigation systems like the GPS and the Global Navigation Satellite System (GLONASS), are satellite based. Others, like the LORAN-C system, use a series of terrestrial transmitters. Still others like the Distance Measuring Equipment (DME) and Tactical Air Navigation (TACAN) systems determine aircraft

locations relative to a beacon transmitter. Some of these systems perform overlapping functions. Which of the non-radar associated radionavigation systems will continue to be needed? Which may be safely discontinued and when may that occur? Are there any new types of radionavigation systems being developed or investigated?

5. Other Space Services and Radio Astronomy

39. The satellite services for mobile, fixed, broadcasting, and radiodetermination applications have been discussed previously in this Notice in conjunction with the analogous terrestrial services.50 This section covers the Earth exploration- and meteorological-satellite services, the inter-satellite service, the space operation 51 and space research services, and a proposed generalsatellite service. The radio astronomy service, which, like the space services, involves equipment receiving radio signals from space, is also covered. NTIA is seeking information on future requirements in these services. How do technology and propagation characteristics of the space services and radio astronomy limit the frequency ranges in which they can be accommodated? What other services can share frequency bands with the space services and radio astronomy? When will additional spectrum be required or excess spectrum be available for other uses? Does the geographical distribution of Earch stations and radio telescopes suggest possible geographic sharing of spectrum?

(a) Earth Exploration- and Meteorological-Satellite Services

40. Systems in the Earth explorationsatellite service, which includes the meteorological-satellite service, are used where "information relating to the characteristics of the Earth and its natural phenomena is obtained from active sensors or passive sensors on earch satellites [and] from airborne or Earth-based platforms." ⁵² The meteorological-satellite service is "[a]n earth exploration-satellite service for meteorological purposes." ⁵³ Both

50 See supra paras. 19, 27, 33, 37.

geostationary and non-geostationary satellites are used for these functions. To what extent are the uses of Earth exploration and meteorological satellites, both in the public and private sectors, expected to grow? Are current allocations adequate to meet anticipated requirements?

(b) Inter-Satellite Service

41. The inter-satellite service is "[a] radiocommunication service providing links between artificial earth satellites." 54 Inter-satellite links have grown in importance in the United States over the past several years as data relay satellites have largely replaced the ground tracking network. Although current data relay satellites operate space-to-space links in the space research service, future data relay satellites are expected to use the intesatellite service. Thus, the inter-satellite service will become more important.55 Will this trend continue? To what extent will future data relay satellites continue to operate in the space research service?

42. WARC-92 created new, primary inter-satellite service allocations at 24.45-24.75 GHz and 25.25-27.5 GHz.⁵⁸ Will these additional allocations be sufficient to meet future requirements for links between satellites, including

those in low-Earth orbit?

(c) Space Operation Service

43. The space operation service is defined as "[a] radiocommunication service concerned exclusively with the operation of spacecraft, in particular space tracking, space telemetry and space telecommand." ⁵⁷ Spectrum managers originally intended for tracking, telemetry and command (TT&C) communications for spacecraft to be accommodated in the same bands as the other functions of the spacecraft (mission bands).58 However, the space operation service was created so that TT&C requirements for a wide variety of satellites could be accommodated using a few data relay satellites or Earth stations. In the United States, commercial satellite operations generally use the mission bands for TT&C while the government agencies generally use three bands near 2 GHz.59

⁸¹ Requirements for tracking, telemetry, and command of space systems are included in the discussion of the space operation service, although they are often accommodated in other space services.

⁶² NTIA Manual, supro note 28, § 6.1.1 at 6-4,

⁸⁸ Id. § 8.1.1 at 6-8.

⁵⁴ Id. § 6.1.1 at 6-7.

⁶⁷ NTIA Manual, supro note 28, § 6.1.1 at 6-12.

⁸⁸ International Radio Consultative Committee, Rep. No. 845-1, Space Operation Systems § 1 (1990). The use of these "mission bands" for TT&C is still the stated norm; NTIA Manual, supra note 28, § 6.1.1 at 6-12 (defining the space operation service).

⁵⁰ NTIA Manual, supro note 28, § 4.1.3, at 4-62 and footnotes G42 (allocating the 1761–1842 MHz

As satellite systems move to frequencies above 15 GHz, the mission bands will become less suitable for space operations, placing more emphasis on the space operation service. 60 In the future, how will the TT&C functions be divided between the space operation service and the mission bands?

44. The advent of commerciallyowned expendable launch vehicles (ELVs) promised a new alternative for launching commercial payloads. Six frequencies in the 2310-2390 MHz band were allocated in 1988 to support launch telemetry for flight testing of commercial ELVs. 61 Government tracking facilities have begun to reconfigure their telemetry systems to support these operations. The frequency band 2300-2450 MHz was reallocated at WARC-92 to include an additional allocation in the sub-band 2310-2360 MHz for broadcasting-satellite (sound) and complementary terrestrial sound broadcasting in the United States and India. 52 Implementation of this allocation and any subsequent development of broadcasting-satellite systems in this sub-band may impact the use of the three lower frequencies set aside for commercial ELV support. NTIA seeks comments regarding the future spectrum requirements for launch vehicles, both commercial and government-owned, considering the results of WARC-92. Will the commercial launch industry spawn private launch facilities? If so, does the private sector have spectrum requirements for related operations. such as tracking for launch vehicles and flight termination systems?

45. For government spacecraft in low-Earth orbit, TT&C communications are provided through the National Aeronautics and Space Administration (NASA) Tracking and Data Relay Satellite System (TDRSS). Commercial satellites can also use TDRSS for inorbit telemetry in the 2285-2290 MHz and 14.896-15.121 GHz bands.63 Is this

allocation adequate to meet future requirements for commercial satellite telemetry via data relay satellites? What other in-orbit TT&C communications will be required, both for government and commercial spacecraft?

(d) Space Research Service

46. The space research service is "[a] radiocommunication service in which spacecraft or other objects in space are used for scientific or technological research purposes." 64 The space research service encompasses both deep space systems 65 and those nearer to the Earth. As a research-oriented organization, NASA operates most of its systems in the space research service. This results in a broadening of space research service applications to include such things as data relay links for a wide variety of spacecraft, both government and commercial. Is the continued use of the space research service for such systems appropriate? If not, what services should be used? Are current space research allocations adequate to meet future requirements if data relay satellites continue to use this service?

47. At WARC-92, the United States proposed new space research allocations for extra-vehicular activities (410-420 MHz) and for use in proximity of a space station (400.15-401 MHz).66 WARC-92 created these allocations, though the space research service is secondary to the fixed and mobile services in the 410-420 MHz band.67 How much are such space research activities expected to increase? Are these new allocations, in addition to the current space research activities expected to increase? Are these new allocations, in addition to the current space research allocations, adequate to meet future spectrum requirements? Under what service should radiocommunications requirements involving satellites of the sun, moon, and other planets be met?

(e) General-Satellite Service

48. Another U.S. proposal at WARC-92 would have created a new "generalsatellite service" to "provide for both mobile-and fixed-satellite applications within one radio service." 68 The

service allocations. 69 Rather than establishing the new service immediately, WARC-92 upgraded the existing mobile-satellite service allocations in those bands to primary status in Region 2 70 and recommended further study of the issue.71 Considering the decisions of WARC-92, should the concept of a general-satellite service above 30 GHz be pursued? What types of systems would operate in the service? What are their spectrum requirements? Should other space services allocations above 20 GHz also be replaced with general-satellite service allocations?

proposal would have replaced the

current fixed-and mobile-satellite

29.5-30 GHz with general-satellite

service allocations at 19.7-20.2 GHz and

(f) Radio Astronomy Service

49. The radio astronomy service is a service used in scientific research for "the reception of radio waves of cosmic origin." 72 However, radio astronomy receivers require exceptionally high antenna gain and receiver sensitivity in order to detect the desired signals. This makes them highly susceptible to interference. How can radio astronomy be adequately protected as the use of other portions of the radio spectrum increases? In particular, what protection should be afforded from out-of-band airborne and satellite-borne transmitters? What is the potential impact of the proliferation of nonlicensed devices on radio astronomy? 73

50. Radio telescopes are designed to detect two types of radio emissions from space: continuum radiation and spectral line radiation. For continuum emissions, observations at frequency intervals of about one octave are usually adequate to determine the special distribution.74 Are current radio astronomy allocations adequate in bandwidth and spacing to meet future needs? Very long baseline interferometry (VLBI) techniques are used to improve spatial resolution of

band for Earth-to-space links). G101 (allocating the 2200-2290 MHz band for space-to-Earth and spaceto-space links), and US90 (allocating the 2025-2110 MHz band for Earth-to-space and space-to-space links).

observed objects. These techniques currently employ antennas located in different countries to provide adequate spacing. The use of VLBI techniques requires the simultaneous protection of the frequencies in all the countries involved.⁷⁵ How can requirements for VLBI experiments in many countries be accommodated?

observed hundreds of spectral lines, certainly not all of the frequencies can be protected. The most important lines, selected by the International Astronomical Union, have largely received protection internationally. Are the spectral lines used in radio astronomy adequately protected? Will radio astronomy require protection for additional lines in the future? If so, how can this protection be provided in bands allocated to other services?

6. Amateur Radio Service

52. Amateur radio operators provide many non-commercial public services via radiocommunications, including emergency communications during natural disasters. Many of the technological advances in radiocommunications can be traced back to initial experimentation carried out in the amateur service. Currently, the amateur service performs an important and useful function as an adaptor of complicated and expensive technologies, often producing versions of communications systems more suitable for practical use. The present amateur service frequency allocations cover a wide range of frequencies and vary in status from operation on a noninterference, unprotected basis 78 to primary (exclusive) status 79 in the National Table of Frequency Allocations. Some amateur operations share frequency bands with government radiolocation, fixed, or mobile services.

75 Id.

53. NTIS seeks comments on the future spectrum requirements for the amateur radio service. What factors could either increase or reduce the spectrum requirements of the service? Is the current spectrum used by amateurs adequate? What new techniques may increase the ability of the amateur service to share with other radio services in certain frequency bands?

7. Other Services

54. NTIA also seeks comments on other currently allocated radio services not specifically addressed above (e.g., Standard Frequency and Time Signal Service). We are also interested in proposed new and innovative uses of the spectrum that are not currently accommodated with the National Table of Frequency Allocations or for which no specific radio service has been defined. What spectrum requirements can reasonably be anticipated for these services, and what frequency bands are suitable or required to accommodate these services? In addition, are the current arrangements, if any, for temporary assignments for experimental purposes adequate? Or, do they tend to hamper innovation when the development fits in no existing service? Similarly, does that lack of conformity to the service definitions of multifunction systems (e.g., those that combine voice communications with positioning) hamper their development? Considering the decisions of WARC-92 and the Voluntary Group of Experts (VGE) 80, should general radio service categories be developed?

B. Technologies

55. In this part of the inquiry, NTIA solicits information concerning emerging or existing technologies that could have an impact on requirements for spectrum use. We specifically request information on (a) technologies whose implementation would result in more efficient and effective use of the spectrum while at the same time satisfying service requirements, and (b) those technologies whose implementation may require increased spectrum usage. Further guidance on the information desired is contained in the following paragraphs.

1. Technologies That Increase the Utility of Higher Frequencies

 Usage of the radio spectrum is less concentrated at higher frequencies than

at lower frequencies, but, as noted above, technological limitations in design and manufacture of radio systems often preclude the use of higher frequencies for many services. The physics of radio frequency propagation often limit the usage even further (e.g. the combination of high signal propagation loss and low-gain mobile antennas severely limits mobile coverage range). However, progress is being made. The application of newer, solid-state devices might support development of mobile service equipment that operate at higher frequencies than those presently in use. Wireless local area computer networks are being developed at 18 GHz. 81 Pointto-point communications are also being implemented at higher frequencies. 82 In order to assess the full impact of future spectrum requirements, we are soliciting information on techniques and devices that have been developed or are under development that could facilitate the use of higher frequencies. What are the specific functions of such techniques or devices? What radio services will they support? Does the capability represent a mature technology or is it under development? Information on the limitations and costs associated with the techniques or devices is requested. To what portion of the spectrum is the particular technique or device applicable?

2. Microprocessor-based Radio Technologies

57. In recent years, microprocessors increasingly have been incorporated into radio systems, making possible new technologies that use the spectrum more efficiently. 83 Most of these technologies are related to mobile communication. For example, trunked systems use a computer to select an available channel so that the assigned channels are used more efficiently. Priority access could allow users having diverse missions to share the same trunked system, ensuring that critical communications could preempt routine communications. Cellular radio systems employ relatively low power transmitters and frequency reuse to improve efficiency. Future computer-controlled communications systems could dynamically apportion spectrum resources, further improving efficiency. What other microprocessor-

⁷⁸ Id. § 4.3.

⁷⁷ IN 1987, emissions from interstellar methanol masers were discovered at 12.179 GHz, which lies in a band allocated for fixed-satellite service downlinks. Observations of this line have been severely limited. At least one party has stated that such observations would be very difficult to accommodate because of heavy commercial investment. See Comments of National Science Foundation at 9, NTIA Spectrum Notice, supra note

¹⁸ For example, footnote US275 to the National Table of Frequency Allocations allows amateur operations in the 902-928 MHz band on a secondary and unprotected basis to other services operating in accordance with the Table, and other certain radio services (i.e., Automatic Vehicle Monitoring). NTIA Manual, supra note 28. § 4.1.3.

⁷⁹ For example, the frequency band 144-146 MHz is allocated to the Amateur and Amateur-Satellite services on an exclusive basis.

⁸⁰ International Telecommunication Union, Resol. No. 1009, Establishment of a Voluntary Group of Experts to Study Allocation and Improved Use of the Radio-Frequency Spectrum and Simplification of the Radio Regulations (Nov. 2, 1990).

^{*1} Gilder, supra note 31, at 324, 330.

⁸² See Emerging Technologies Inquiry, supra note

^{*3} This section covers technologies that employ microprocessors in the radio frequency portions of communications systems. NTIA supports the use of such technologies to improve spectrum efficiency. See NTIA Spectrum Study, supro note 3, at 148.

based technologies could improve the efficiency of spectrum use? How will their use affect future spectrum requirements?

(a) Trunking

58. Whereas conventional land mobile systems have exclusive use of their channels in a geographic area. regardless of how heavily those channels are used, trunked systems assign numerous users to a few channels, increasing spectrum efficiency. When a user activates a transmitter in a trunked system, the system locates an available channel and assigns it to that transmitter. 84 When the user is finished the channel is available for assignment to another user. This process is known as "demand assignment." What developments in trunking technology are possible that might increase even further the spectrum efficiency of trunked systems? What sort of spectrum savings could be reasonable anticipated? For what types of mobile radio users is the use of trunking technology impractical or otherwise inappropriate?

59. In addition to assigning channels to users only when needed, trunked systems can also provide priority access to certain users. In a priority access system, available channels are assigned to users based on a priority basis instead of "first come, first served." A user having high enough priority can even preempt a lower priority user if all other channels are used. How can priority access systems be used to increase the effectiveness of trunked systems?

(b) Cellular Radio

60. Cellular radio 85 is another microprocessor-based technology that conserves spectrum. Cellular systems use service areas, called "cells," that are typically much smaller than the service areas used with trunked systems. Each cell has a base station and a set of frequencies. The frequencies can be "reused" in non-adjacent cells without interference. While the mobile units in a cell communicate with the base station by radio, the base stations are tied to the telephone system or to other base stations by wire or by fixed microwave. Each cell operates, in effect, like a trunked system using computer-selected

frequencies to link the base station with the mobile units. Computers also control the "handoff" from one base station to another as mobile units move between cells. Since the service areas are smaller in a cellular system than in a conventional land mobile system, fewer frequencies are required, even considering the need to avoid using the same frequencies in adjacent cells. Some have argued that dividing the cells into sectors with different frequencies can increase the efficiency even more.86 To what extent could "cellular-type" technology be applied to private land mobile dispatch usage? What percentage of the private land mobile market, whether trunked or not, can be satisfied by the use of cellular telephone or PCS having access to the public switched network?

(c) Dynamic Control of Spectrum Resources

61. Permanent band allocations result from international and national regulatory processes and can take months or years to change. The benefits of dynamic control of spectrum resources can, in a sense, replace these permanent band allocations and can theoretically be extended to the control of power and bandwidth. If a band were allocated to a number of different services, a computer linking or managing a system theoretically could be used to rapidly adjust the proportion of the bank available to each service in response to changing requirements.87 What services could benefit from dynamic control of spectrum resources? What potential drawbacks would be associated with such a system?

62. For many systems, communications requirements, including the relative locations of the transmitter and receiver and the bandwidth of the baseband signal, vary with time. Typically, the systems are designed conservatively, always operating so as to be able to meet the most demanding scenario. However, the unnecessarily large bandwidth or transmitter power that could result from this design wastes spectrum resources. In its comments to the NTIA Spectrum Notice, the Personal

Radio Steering Group (PRSG) described in the "radio of tomorrow" as "a computer with an RF 'front end.' " 88 The PRSG envisions computercontrolled communications networks. each able to "dynamically shift its capabilities and performance to meet only the actual immediate demand, * consuming only the necessary resources and releasing unneeded resources * * *." 89 How could the spectrum resources "released" by such a system be made available to other users? Are such systems practical? How soon could technology be available to implement such a system?

63. During U.S. preparations for WARC-92, several developing technologies and dynamic spectrum management techniques were discussed. These techniques have a potentially significant impact on the current level of congestion in the HF bands. The technologies include: (a) Low cost single-sideband (SSB) HF broadcast receivers; (b) frequency agile mobile and fixed HF radio systems; and (c) automatic link establishment HF radio systems. The dynamic spectrum management techniques include the use of computerized data bases containing the operating schedules of the major users of a band and real time computer. control of frequency agile radio equipment. What will be the likely impact of the above and other technologies and spectrum management techniques on current users of the HF bands?

3. Antenna and Propagation Technologies

64. Technological innovations can increase the usability of the radio spectrum, through either the use of higher frequencies, as noted above, or techniques that allow more users in the same frequency bands. Antenna innovations and design improvements along with increased understanding of propagation effects, have, in the past, contributed to increases in spectrum efficiency. For example, the development of antennas with increased directivity and increased discrimination for cross-polorized signals has allowed increased sharing of frequency bands. Increased understanding of radio frequency propagation effects, e.g., fading characteristics, has supported the development of communication systems that provide a more effective use of the spectrum. NTIA, recognizing the importance of understanding radio

nked system using computer-selected

*7 The 1545-1559 MHz and 16
bands are allocated on a primar

^{*4} If, however, all channels are being used, the user requesting a channel is "blocked." The quality of such multiple access systems is often measured either as the probability that a user will be blocked, or as the expected time required to obtain a clear channel.

^{*5} The term "cellular radio" as used here refers to the cellular technology as a whole, not just to cellular telephone.

⁸⁶ Kucar, Mobile Radio: An Overview, IEEE Communications Magazine, Nov. 1991, at 72, 80.

bands are allocated on a primary basis to the aeronautical mobile-satellite service (AMSS). Segments of these bands, 1549.5-1558.5 MHz and 1651-1660 MHz, also have primary allocations to the mobile-satellite service (MMS). However, in these segments. AMSS requirements have priority over MSS requirements when the former cannot be met elsewhere in the bands. Thus, the co-primary segments are, in effect, reallocated when required by the AMSS demand. NTIA Manual. supra note 28, § 4.1.3, at 4-59 to 4-60 and footnote US308.

^{**} Comments of Personal Radio Steering Group at 2. NTIA Spectrum Notice, supra note 2.

⁸⁹ Id. at 5.

frequency propagation effects, conducts various propagation studies at its laboratories in the Institute for Telecommunication Sciences, in Boulder, Colorado.

65. We request comments on technological developments in the areas of antennas and propagation that could contribute to more effective utilization of the radio spectrum. What are the antenna developments that will support the utilization of certain services, e.g., small and efficient antennas for use with personal communication devices? Similarly, what propagation developments, such as increased understanding of ionospheric sky-wave progagation, will contribute to the usability of the spectrum? What are the specific attributes of the development that impact spectrum utilization? Does the capability represent a mature technology or is it under development? Is the particular technology applicable to a specific frequency band, and, if so, what is the frequency range of applicability?

4. Signal Modulation

66. Many efficiencies in the use of the spectrum have come about because of advancements in signal modulation. Signal modulation is the process whereby desired information is impressed onto the "carrier" signal. For many years, double-sideband amplitude modulation (DSB), such as still used in our AM broadcast band, was the predominant modulation for a wide variety of applications, including fixed, aeronautical, and maritime-mobile operations. For many applications DSB has been replaced by single-sideband (SSB) suppressed (or reduced) carrier modulation, with the result that transmitted bandwidth was reduced by almost 50 percent, and transmitter power requirements were reduced. Amplitude companded SSB, along with other recent modulation processes, is now capable of operating in 5 kHz channels. Systems using these modulation processes are candidates for operation in the 220-222 MHz band where the channelization is 5 kHz. What other bands should employ narrowband techniques?

67. Frequency modulation (FM) has been the mainstay for many mobile operations. Over time, advances in technology have allowed single channel bandwidths to be reduced from 100 kHz to 25 kHz, and in some cases to 12.5 kHz, with the promise of 6.25 kHz or better for the future. What types of modulation will be used in mobile operations in the future, and what bandwidths will be practicable?

68. Other types of modulation-some new, some envisioned for many yearshave come to the forefront as advanced solid-state devices have made some other modulation schemes, especially digital modulation, practicable. For several years, government agencies have been using digitized voice and the Digital Encryption Standard (DES) for voice privacy requirements. The effective data rate possible with such systems has increased over the years, due to modulation processes such as Quadrature-Amplitude-Modulation (QAM). Time Division Multiple Access (TDMA) and Code Division Multiple Access (CDMA) are other highefficiency processes that allow many users to share a single radio channel. What radio services would benefit from the use of these modulation processes? Will digital modulation replace analog modulation in most radio services? What will be the effect of using increased digital modulation schemes on standardized channeling schemes?

69. The introduction of new modulation techniques has not always resulted in lessened bandwidth. One such technique, spread-spectrum, has become popular with the military services because of its inherent interference-resistant and lowdetectability characteristics. Spread spectrum systems typically use up to 1000 times the baseband information bandwidth for transmission. At the same time, the transmitted power density is very low, making the signals difficult to detect by unauthorized entities, and, in some cases, allowing them to be "overlaid" on existing signals without causing interference. What types of services can best share with spread-spectrum "overlaid" signals?

70. One of the major advantages of digital modulation is the potential for data compression, removing redundant information from signals to reduce the bit rate and thus the required bandwidth. The decreased bandwidth permits smaller channel spacing, allowing more users to operate in a given frequency band. What are the potential effects of data compression on spectrum requirements? What other digital signal processing techniques can be used to conserve spectrum? What services can take advantage of these techniques?

71. In view of this mix of narrow- and wide-band systems, NTIA seeks comments on the future of modulation processes. Will spectrum efficiency be gained through systems with high bitsper-Hertz ratings, or through spread-spectrum systems, with the attendant low probability of interference? What

new modulation types are yet to come? Which of the known types will stay with us for the foreseeable future? Can new modulation techniques lead to increased spectrum sharing or increased efficiency in spectrum use? What technologies (e.g., improved batteries and solid state devices) are critical to the future use of innovative modulation systems?

5. Other Technologies

72. The preceding paragraphs contain examples of technologies that could impact future spectrum requirements. However, these examples might not be complete. There could well be other technologies, outside the scope of the examples, that have been developed or are being developed that could have an impact on the use of the spectrum. These other technologies might be so different or unique as to not fall into our current notions for capabilities that impact spectrum use. We request information on such innovative technologies. What are their specific functions? What radio services will they support? What is the status of the development of the technology? Is the technology limited to particular portions of the spectrum? If so, what portions of the spectrum would be affected?

C. Spectrum Sharing Issues

73. As noted above, the existing practice of allocating separate portions of the spectrum to different radio services and to different classes of users has become increasingly complex and spectrum has become congested in some areas and frequency bands while remaining almost empty in others. Both the FCC and NTIA are introducting flexibility in the spectrum management process by assigning frequencies to stations operating in bands not normally allocated for that class of user, thereby increasing the amount of sharing of spectrum resources. Federal law enforcement agencies, for example, are permitted to operate radios in bands normally limited to state and local policy during emergencies. 90 Similarly, state and local police forces are permitted to operate radios in federal bands when necessary to communicate with their federal counterparts.91 Sharing of trunked land mobile systems is being implemented at several military bases where base administrative and emergency functions share the base's system, which also provides services to the larger federal community in the area. Many military training and exercise

⁹⁰ NTIA Manual, supra note 28, §§ 7.3.4, 7.12.

^{91 47} CFR 90.173(c) (1991).

activities in the United States use frequencies in bands allocated to private sector users, after careful coordination of frequencies and operating times with the FCC. 92 However, additional sharing by other radio services or classes of users may not be feasible within the strictures of the existing limited-access allocation bands.

74. The NTIA Spectrum Study calls for increased flexibility in spectrum management by restructuring the ways in which radio system operators are given greater flexibility to use the spectrum through a number of regulatory changes.93 First, the study recommended that the FCC and NTIA remove artificial barriers between similar radio services wherever possible. In its broadest interpretation. all forms of land mobile radio, belonging to private sector or government (state, local or federal) users could operate in all regions of the spectrum allocated to that service. Second, the study calls for the FCC (whose technical regulations are generally more restrictive than NTIA's) to remove rigid technical standards regarding how services operate in a band. Under such conditions, users can change the type of technology used in each band without regulatory action. The FCC has employed this approach, with some success, in implementing new digital cellular radio services.94 Third, the study recommends that NTIA and the FCC should explore using interference criteria and compatibility control procedures to permit sharing of the spectrum by dissimilar services.

75. The ITU is also exploring ways to enhance the use of the spectrum. It has chartered the VGE to consider ways to improve the ITU's role in spectrum management and, in particular, to simplify the ITU Radio Regulations. The ITU's International Radio Consultative Committee (CCIR) has established a Task Group to support the VGE by examining the technical and operational methods used for the allocations. 95

76. There are already a number of users seeking access to the spectrum in order to provide services not currently available in the marketplace. Thus, the FCC, NTIA, and the ITU are attempting to increase sharing of the spectrum among radio services and classes of users so that the spectrum will be capable of supporting more users. If these sharing proposals are successful, a vastly different spectrum management process could result. It could feature large blocks of spectrum in which a number of different radio services and classes of users could operate. Such a system would replace the existing process of allocating bands to specific radio services and classes of users. Any number of ways of using computers. controllable transmitters with varying powers, bandwidths and frequencies, and receivers that are addressable over a wide range of frequencies are possible. This approach could include increased use of lower powered devices, similiar to Part 15 devices, that operate without licenses and theoretically without affecting other devices and systems.

77. If sharing between dissimilar classes of spectrum users is to increase, what kinds of standards or performance guidelines will promote this sharing and improve spectrum efficiency? What are the radio service requirements for worldwide spectrum allocations, and should they be exclusive in the United States? What are the specific national requirements for exclusive frequency bands? What radio services are required in these bands, and why must they be exclusive in the United States?

D. International Radio Conferences

78. Any study of U.S. spectrum requirements must also address international spectrum management issues. The ITU is the focal point for development of international radio regulations and spectrum allocations. The rapid development of radio-based technologies and the internalization of telecommunications development have dramatically increased the importance of the ITU decision-making processes. The changing international order, made evident at the WARC-92, has created new alliances and centers of cooperation resulting in many common proposals from groups of administrations that tend to vote together as a bloc on major issues, e.g., the Conference of European Postal and Telecommunications Administrations (CEPT). The expansion of existing groups and the creation of others will significantly influence the ITU processes-WARCs, CCIR meetings,

and others. Further, there has been a significant increase in interest by commercial entities in the ITU processes by many administrations in both developed and developing countries.

79. In recognition of these factors, and with the understanding that future WARCs will be held at two year intervals, a number of questions can be raised. What options does the United States have to strengthen ties and cooperation with these new, strong groups of administrations? How can the relationships between countries in ITU Region 2 be strengthened to achieve greater cooperation and common good? How can U.S. commercial interests which are sometimes competing with one another be addressed during the preparatory process in a manner that is fair and equitable to all concerned? We solicit views regarding how to reconcile competing spectrum requirements of the federal government and the private sector. We request information on how to best present U.S. proposals to ITU WARCs, given their international nature, in order to promote U.S. commercial and government interests? Regarding this, should the ITU schedule for submitting proposals eight months before a conference be rigidly adhered to in order to maximize the possibility of acceptance of the proposals? What are the pros and cons regarding early submission of proposals? Further, should the United States have a cut-off date after which no new proposals would be accepted for consideration in order to improve the preparatory process?

80. WARC-92 addressed many diverse issues over a four-week period. Resolution of divergent views on the "conference floor" was found to be extremely difficult, especially when protection of existing services or competitive concerns were involved. We solicit views on how the United States can better coordinate and narrow differences with other administrations prior to such conferences in order to minimize widespread controversy. Further, can the national spectrum planning activities broached by this Notice be used as a basis for a more strategic consideration of U.S. international interests and dialog with other administrations?

81. The topic of appointing the chairperson of the delegation as early as possible, at least one year in advance, has been raised in past reviews of the U.S. WARC preparatory process. During this would provide more continuity for preparations; but, each conference delegation usually has a different chairperson. It has also been suggested that the United States should consider

⁹² Sharing is also possible by users with widely differing status. The amateur service, on a secondary basis, has successfully shared radiolocation bands with high-priority military radars for many years.

⁹³ NTIA Spectrum Study, supra note 3, Chapter 3,

⁹⁴ See 47 CFR §§ 22.900–22.930 (1991); see also Libralization of Technology and Auxiliary Service Offerings in Domestic Cellular Radio Telecommunications Service, Report and Order. 3 FCC Rcd 7033 (1988); Memorandum Opinion and Order. 5 FCC Rcd 1138 (1990).

⁹⁸ International Radio Consultative Committee, Circular CE1/1598 (Nov. 13, 1990).

appointing a chairperson "at-large" who would serve for an interval that covers two or more conferences. In light of a more intense conference schedule, we solicit comments on the advantages and disadvantages of such an approach.

82. Finally, we solicit comments on the long-term effects of international radio conferences on meeting spectrum requirements, and the appropriate U.S. approach to gain international acceptance of U.S. proposals for future international conferences.

IV. Conclusion

83. NTIA hereby requests comments in this inquiry to be filed on or before October 1, 1992, and reply comments to be filed on or before December 1, 1992.

Dated: June 1, 1992.

Thomas J. Sugrue,

Acting Assistant Secretary of Commerce for Communications and Information.

[FR Doc. 92-13848 Filed 6-11-92; 8:45 am]

BILLING CODE 3510-60-M

COMMITTEE FOR THE IMPLEMENTATION OF TEXTILE AGREEMENTS

Adjustment of Import Limits for Certain Wool and Man-Made Fiber Textile Products Produced or Manufactured in the People's Republic of China

June 8, 1992.

AGENCY: Committee for the Implementation of Textile Agreements (CITA).

ACTION: Issuing a directive to the Commissioner of Customs increasing limits.

EFFECTIVE DATE: June 15, 1992.

FOR FURTHER INFORMATION CONTACT:

Janet Heinzen, International Trade Specialist, Office of Textiles and Apparel, U.S. Department of Commerce, (202) 377–4212. For information on the quota status of these limits, refer to the Quota Status Reports posted on the bulletin boards of each Customs port or call (202) 566–6828. For information on embargoes and quota re-openings, call (202) 377–3715.

SUPPLEMENTARY INFORMATION:

Authority: Executive Order 11651 of March 3, 1972, as amended; section 204 of the Agricultural Act of 1956, as amended (7 U.S.C. 1854).

The current limits for certain categories are being increased by recrediting unused carryforward.

A description of the textile and apparel categories in terms of HTS numbers is available in the CORRELATION: Textile and Apparel Categories with the Harmonized Tariff Schedule of the United States (see Federal Register notice 56 FR 60101, published on November 27, 1991). Also see 56 FR 60976, published on November 29, 1992.

The letter to the Commissioner of Customs and the actions taken pursuant to it are not designed to implement all of the provisions of the bilateral agreement, but are designed to assist only in the implementation of certain of its provisions.

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

Committee for the Implementation of Textile Agreements

June 8, 1992.

Commissioner of Customs,

Department of the Treasury, Washington, DC 20229.

Dear Commissioner: This directive amends, but does not cancel, the directive issued to you on November 22, 1991, by the Chairman, Committee for the Implementation of Textile Agreements. That directive concerns imports of certain cotton, wool, man-made fiber, silk blend and other vegetable fiber textiles and textile products, produced or manufactured in China and exported during the twelve-month period which began on January 1, 1992 and extends through December 31, 1992.

Effective on June 15, 1992, you are directed to amend the November 22, 1991 directive to increase the limits for the following categories, as provided under the terms of the current bilateral textile agreement between the Governments of the United States and the People's Republic of China:

Category	Adjusted twelve-month limit 1
Levels not subject to	
a group	14,568 dozen.
438	25,494 dozen.
444	193,074 numbers.
448	
649	780,931 002en.

¹ The limits have not been adjusted to account for any imports exported after December 31, 1991.

The Committee for the Implementation of Textile Agreements has determined that these actions fall within the foreign affairs exception to the rulemaking provisions of 5 U.S.C. 553(a)(1).

Sincerely,

Auggie D. Tantillo,

Chairman, Committee for the Implementation of Textile Agreements.

[FR Doc. 92-13846 Filed 6-11-92; 8:45 am]

COMMITTEE FOR PURCHASE FROM THE BLIND AND OTHER SEVERELY HANDICAPPED

Procurement List, Proposed Additions

AGENCY: Committee for Purchase from the Blind and Other Severely Handicapped.

ACTION: Proposed Additions to Procurement List.

SUMMARY: The Committee has received proposals to add to the Procurement List a commodity and services to be furnished by nonprofit agencies employing persons who are blind or have other severe disabilities.

COMMENTS MUST BE RECEIVED ON OR BEFORE: July 13, 1992.

ADDRESSES: Committee for Purchase from the Blind and Other Severely Handicapped, Crystal Square 3, suite 403, 1735 Jefferson Davis Highway, Arlington, Virginia 22202–3509.

FOR FURTHER INFORMATION CONTACT: Beverly Milkman (703) 557-1145.

SUPPLEMENTARY INFORMATION: This notice is published pursuant to 41 U.S.C. 47(a)(2) and 41 CFR 51-2.3. Its purpose is to provide interested persons an opportunity to submit comments on the possible impact of the proposed actions.

If the Committee approves the proposed additions, all entities of the Federal Government (except as otherwise indicated) will be required to procure the commodity and services listed below from nonprofit agencies employing persons who are blind or have other severe disabilities.

I certify that the following action will not have a significant impact on a substantial number of small entities. The major factors considered for this certification were:

 The action will not result in any additional reporting, recordkeeping or other compliance requirements for small entities other than the small organizations that will furnish the commodity and services to the Government.

The action will result in authorizing small entities to furnish the commodity and services to the Government.

3. There are no known regulatory alternatives which would accomplish the objectives of the Javits-Wagner-O'Day Act (41 U.S.C. 46-48c) in connection with the commodity and services proposed for addition to the Procurement List.

Comments on this certification are invited. Comments should identify the statement(s) underlying the certification on which they are providing additional information.

It is proposed to add the following commodity and services to the Procurement List:

Commodity Dustpan, Short Handle 7290-00-616-0109.

Nonprofit Agency: Royal Maid Association for the Blind, Inc., Hazlehurst, MS.

Services Commissary Shelf Stocking, Naval Air Station, Corpus Christi, TX.

Nonprofit Agency: Nueces County Mental Health/Mental Retardation Community Center, Corpus Christi,

Commissary Shelf Stocking and Custodial, Fort McClellan, AL. Nonprofit Agency: Alabama Goodwill Industries, Inc., Birmingham, AL, Commissary Shelf Stocking and

Custodial, Fort Rucker, AL.

Nonprofit Agency: Goodwill Industries of Central Alabama, Inc., Montgomery, AL

Commissary Shelf Stocking and Custodial, Fort Irwin, CA.

Nonprofit Agency: Job Opportunities and Benefits, Hesperia, CA. Commissary Shelf Stocking and

Custodial, Naval Station, Treasure Island, CA.

Nonprofit Agency: Calidad Industries, Oakland, CA.

Commissary Shelf Stocking and Custodial, Naval Air Station, Jacksonville, FL.

Nonprofit Agency: Clay County Association for the Retarded, Inc., Green Cove Springs, FL.

Commissary Shelf Stocking and Custodial, Fort Campbell, KY.

Nonprofit Agency: Pennyroyal Regional Mental Health/Mental Retardation Board, Inc., Hopkinsville, KY.

Commissary Shelf Stocking and Custodial, Fort Devens, MA.

Nonprofit Agency: Worcester Area Association for Retarded Citizens, Inc. Worcester, MA

Commissary Shelf Stocking and Custodial, Selfridge Air National Guard Base, Mount Clemens, MI.

Nonprofit Agency: Goodwill Industries of Greater Detroit, Detroit MI. Commissary Shelf Stocking and Custodial, Naval Construction

Battalion Center, Gulfport, MS. Nonprofit Agency: Goodwill Industries of South Mississippi, Inc., Gulfport,

Commissary Shelf Stocking and Custodial, Fort Hamilton, NY. Nonprofit Agency: Federation

Employment and Guidance Service,

Brooklyn, NY.

Commissary Shelf Stocking and Custodial, Seneca Army Depot, Seneca, NY.

Nonprofit Agency: Seneca County Chapter, NYSARC, Waterloo, NY. Commissary Shelf Stocking and Custodial, U.S. Marine Corps, Camp Lejeune, NC.

Nonprofit Agency: Coastal Enterprises of Jacksonville, Inc., Jacksonville, NC.

Commissary Shelf Stocking and Custodial, Fort Jackson, SC.

Nonprofit Agency: South Carolina Vocational Rehabilitation Department, West Columbia, SC.

Commissary Shelf Stocking and Custodial, Naval Air Station, Memphis, TN.

Nonprofit Agency: Memphis Goodwill Industries, Inc., Memphis, TN.

Commissary Shelf Stocking, Custodial and Warehousing, Beale Air Force Base, CA.

Nonprofit Agency: Pride Industries, Roseville, CA

Commissary Shelf Stocking, Custodial and Warehousing, Hanscom Air Force Base, MA.

Nonprofit Agency: Work, Inc., Quincy,

Commissary Shelf Stocking, Custodial and Warehousing, Keesler Air Force Base, MS.

Nonprofit Agency: Goodwill Industries of South Mississippi, Inc., Gulfport,

Commissary Shelf Stocking, Custodial and Warehousing, Seymour-Johnson Air Force Base, NC.

Nonprofit Agency: Goodwill Industries of East Central North Carolina, Durham, NC.

Janitorial/Custodial, Naval Weapons Center, China Lake, CA.

Nonprofit Agency: Indian Wells Valley Association for Retarded Citizens, Ridgecrest, CA.

Janitorial/Custodial, Camp Pendleton,

Nonprofit Agency: Mental Health Systems, Inc., San Diego, CA. Janitorial/Custodial, DOD Housing Facility, Hamilton, CA.

Nonprofit Agency: North Bay Rehabilitation Services, Inc., San Rafael, CA.

Janitorial/Custodial, Naval Construction Battalion Center, Port Hueneme, CA.

Nonprofit Agency: ARC Ventura County, Camarillo, CA.

Janitorial/Custodial Naval Air Station Commissary Store, Cecil Field, FL.

Nonprofit Agency: Clay County Association for the Retarded, Inc., Geeen Cove Springs, FL.

Janitorial/Custodial, Naval Station Commissary Store, Mayport, FL.

Nonprofit Agency: Renaissance Center, Inc., Jacksonville, FL.

Janitorial/Custodial, Marine Corps Air Station, Kaneohe Bay, HI. Nonprofit Agency: Lanakila

Rehabilitation Center, Honolulu, HI. Janitorial/Custodial, Naval Supply Activity, New Orleans, LA.

Nonprofit Agency: Goodwill Industries of Southeastern Louisiana, Inc., New Orleans, LA.

Janitorial/Custodial, Offutt Air Force Base, Nebraska (excluding Hospital, Commissary, Buildings 500 and 501 and all AAFES Facilities).

Nonprofit Agency: Goodwill Industries, Inc., Omaha, NE.

Janitorial/Custodial for the following locations: Hadnot Point, Camp Lejeune, NC, Terrawa Terrrace, Camp Lejeune, NC.

Nonprofit Agency: Coastal Enterprises of Jacksonville, Inc., Jacksonville, NC. Janitorial/Custodial, Marine Corps Base. New River, NC.

Nonprofit Agency: Coastal Enterprises of Jacksonville, Inc., Jacksonville, NC. Janitorial/Custodial, Naval Station

Commissary Store, Charleston, SC. Nonprofit Agency: Goodwill Industries of Lower South Carolina, Inc., Charleston, SC.

E.R. Alley, Jr.,

Deputy Executive Director. [FR Doc. 92-13900 Filed 6-11-92; 8:45 am]

BILLING CODE 6820-33-M

Procurement List; Additions

AGENCY: Committee for Purchase from the Blind and Other Severely Handicapped.

ACTION: Additions to Procurement List.

SUMMARY: This action adds to the Procurement List services to be furnished by a nonprofit agency employing persons who are blind or have other severe disabilities.

EFFECTIVE DATE: July 13, 1991.

ADDRESSES: Committee for Purchase from the Blind and Other Severely Handicapped, Crystal Square 3, suite 403, 1735 Jefferson Davis Highway, Arlington, Virginia 22202-3509.

FOR FURTHER INFORMATION CONTACT: Beverly Milkman; (703) 557-1145.

SUPPLEMENTARY INFORMATION: On February 14, April 17 and May 1, 1992, the Committee for Purchase from the Blind and Other Severely Handicapped published notices (57 FR 5420, 13715 and 18869) of proposed additions to the Procurement List.

After consideration of the material presented to it concerning the capability of a qualified nonprofit agency to provide the services at a fair market price and the impact of the addition on the current or most recent contractor. the Committee has determined that the services listed below are suitable for procurement by the Federal Government under 41 U.S.C. 46-48c and 41 CFR 51-2.6.

I certify that the following action will not have a significant impact on a substantial number of small entities. The major factors considered for this certification were:

- 1. The action will not result in any additional reporting, recordkeeping or other compliance requirements for small entities other than the small organizations that will furnish the services to the Government.
- The action will not have a severe economic impact on current contractors for the services.
- The action will result in authorizing small entities to furnish the services to the Government.
- 4. There are no known regulatory alternatives which would accomplish the objectives of the Javits-Wagner-O'Day Act (41 U.S.C. 46–48c) in connection with the services proposed for addition to the Procurement List.

Accordingly, the following services are hereby added to the Procurement List:

Janitorial/Custodial

Southeast Federal Center, Building at 49 L Street, SE, Washington, DC.

Microfilm Reproduction

Mare Island Naval Shipyard, Vallejo, CA.

Parts Machining (Conventional)

Naval Supply Center, Puget Sound, Bremerton, WA.

This action does not affect contracts awarded prior to the effective date of this addition or options exercised under those contracts.

E.R. Alley, Jr.,

Deputy Executive Director. [FR Doc. 92-13901 Filed 6-11-92; 8:45 am] BILLING CODE 6820-33-M

DEPARTMENT OF DEFENSE

Office of the Secretary

Defense Language Institute Board of

AGENCY: Defense Language Institute Foreign Language Center.

ACTION: Notice of meeting.

SUMMARY: The Defense Language
Institute Board of Visitors will hold a
semi-annual open meeting at the
Defense Language Institute Foreign
Language Center, Presidio of Monterey,
California.

DATES: September 29-30, 1992.

ADDRESSES: Those desiring to attend should contact LCDR Linell McCray, USN, Commandant, Defense Language Institute, attn: ATFL-DIC, Presidio of Monterey, California 93944–5006, for further details.

Dated: June 9, 1992.

L.M. Bynum,

Alternate OSD Federal Register Liaison Officer, Department of Defense. [FR Doc. 92–13851 Filed 6–11–92; 8:45 am] BILLING CODE 3810–01-M

Office of the Inspector General

Membership of the Performance Review Board

AGENCY: Office of the Inspector General, Department of Defense (OIG, DOD).

ACTION: Notice of membership to the Performance Review Board, OIG, DOD.

SUMMARY: This notice announces the appointment of the members of the Performance Review Board (PRB) for the OIG, DOD as required by 5 U.S.C. 4314(c)(4). The PRB provides fair and impartial review of Senior Executive Service performance appraisals and makes recommendations regarding performance ratings, performance awards and recertification to the Inspector General.

EFFECTIVE DATE: July 1, 1992.

FOR FURTHER INFORMATION CONTACT:

Mr. Michael Peterson, Chief, Employee Relations Division, Personnel and Security Directorate, Office of the Assistant Inspector General for Administration and Information Management, OIG, DOD, 400 Army Navy Drive, Arlington, VA, (703) 693– 0257.

SUPPLEMENTARY INFORMATION: In accordance with 5 U.S.C. 4314(c)(4), the appointed members of the PRB for the OIG, DOD are identified in the enclosures. They will serve until further notice.

Dated: June 9, 1992.

Linda M. Bynum,

Alternate OSD Federal Register Liaison Officer, Department of Defense.

Foreign Periodicals Program; Inviting Applications for New Awards for Fiscal Year (FY) 1992

Purpose of Program: The Foreign
Periodicals Program provides grants
to eligible institutions to acquire and
provide access to certain types of

periodicals published outside the United States.

Eligible Applicants: An institution of higher education, a public or nonprofit private library institution, or a consortium of these institutions that meets the requirements in 34 CFR 671.2 (a) and (b) is eligible to receive a

Deadline for Transmittal of Applications: July 31, 1992. Applications Available: June 16, 1992. Available Funds: \$500,000. Estimated Range of Awards: \$25,000 to \$50,000.

Estimated Average Size of Awards: \$33,000.

Estimated Number of Awards: 15.

Note: The Department is not bound by any estimates in this notice.

Project Period: Up to 36 months. Applicable Regulations: (a) The **Education Department General** Administrative Regulations (EDGAR) in 34 CFR parts 74, 75, 77, 80, 82, 85, and 86, and (b) The regulations for this program in 34 CFR part 671, as published in this issue of the Federal Register.

For Applications or Information Contact: Joseph F. Belmonte, U.S. Department of Education, 400 Maryland Avenue, SW., room 3052, ROB-3, Washington, DC 20202-5331. Telephone (202) 708-7283. Deaf and hearing impaired individuals may call the Federal Dual Party Relay Service at 1-800-877-8339 (in the Washington, DC 202 area code, telephone 708-9300 between 8 a.m. and 7 p.m., Eastern

Special Projects and Demonstrations for Providing Supported Employment Services to Individuals With Severe Handicaps—Community-Based **Projects; Notice Inviting Applications** for New Awards for Fiscal Year (FY)

Purpose of Program: To provide grants for community-based special projects and demonstrations to stimulate the development of innovative approaches for improving and expanding the provision of supported employment services to individuals with severe handicaps and to enhance local capacity to provide supported employment services.

The community-based projects support AMERICA 2000, the President's strategy for moving the Nation toward the National Education Goals, by enhancing supported employment services for individuals with severe handicaps. National Education Goal five specifically calls for adult Americans to possess the knowledge and skills necessary to compete in a global economy and exercise the rights and responsibilities of citizenship.

Eligible Applicants: Applications for community-based projects may be submitted by public and nonprofit rehabilitation facilities, designated States units, and other public and private agencies and organizations. Deadline for Transmittal of

Applications: September 1, 1992. Deadline for Intergovernmental Review: November 2, 1992. Application Available: June 29, 1992. Available Funds: \$1,500,000. Estimated Range of Awards: \$100,000-\$130,000.

Estimated Average Size of Awards: \$114,000.

Estimated Number of Awards: 13.

Note: The Department is not bound by any esitmates in this notice.

Project Period: Up to 36 months. Applicable Regulations: The **Education Department General** Administrative Regulations (EDGAR) in 34 CFR parts 74, 75, 77, 79, 80, 81, 82, 85 and 86; and (b) The regulations for this program in 34 CFR part 380.

Priorities: Under 34 CFR 75.105(c)(1) the Secretary is particularly interested in applications that meet the following invitational priority. However, an application that meets this invitational priority does not receive competitive or absolute preference over other applications:

Unserved and Underserved Populations: Projects that: (1) Provide supported employment services to unserved or underserved disability populations that include, but are not limited to, individuals with severe physical disabilities, individuals with sensory impairments with at least one other disabling condition, and individuals with traumatic brain injuries; (2) provide rehabilitation engineering and transportation services to those individuals for whom these services are appropriate; and (3) arrange for the provision of extended services for all individuals served by the project.

For Applications or Information Contact: Peter Ebel, U.S. Department of Education, 400 Maryland Avenue, SW., room 3217, Switzer Building,

Washington, DC. 20202-2899. Telephone: (202) 732-4625 (until June 29) or (202) 205-9625 (after June 29). Deaf and hearing impaired individuals may call the Federal Dual Party Relay Service at 1-800-877-8339 (in the Washington, DC 202 area code, telephone 708-9300) between 8 a.m. and 7 p.m., Eastern time.

Program Authority: 29 U.S.C. 777a(d). Dated: June 8, 1992.

Michael E. Vader,

Acting Assistant Secretary, Office of Special Education and Rehabilitative Services. IFR Doc. 92-13832 Filed 6-11-92; 8:45 am BILLING CODE 4000-01-M

Grants and Cooperative Agreements; Availability, Research and **Demonstration Projects**

AGENCY: Department of Education. ACTION: National Institute on Disability and Rehabilitation Research notice of proposed funding priorities for fiscal years 1993-1994 for certain research and demonstration projects.

SUMMARY: The Secretary proposes funding priorities for Research and Demonstration (R&D) projects under the National Institute on Disability and Rehabilitation Research (NIDRR) for fiscal years 1993-1994. The Secretary takes this action to focus research attention on areas of national need identified through NIDRR's long-range planning process. These priorities are intended to improve rehabilitation services and outcomes for individuals with disabilities.

DATES: Comments must be received on or before July 13, 1992.

ADDRESSES: All comments concerning these proposed priorities should be addressed to Betty Jo Berland, U.S. Department of Education, 400 Maryland Avenue, SW., room 3422, Switzer Building, Washington, DC 20202-2601.

FOR FURTHER INFORMATION CONTACT: Betty Jo Berland. Telephone: (202) 732-1139. Deaf and hearing-impaired individuals may call (202) 732-5316 for TDD services.

SUPPLEMENTARY INFORMATION: This notice contains two proposed priorities in the R&D program. These proposed priorities are for (1) a project on children with epilepsy, and (2) one or more model projects for burn rehabilitation. Authority for the R&D program of NIDRR is contained in section 204(a) of the Rehabilitation Act of 1973, as amended (29 U.S.C. 760-762).

Under this program the Secretary makes awards to public agencies and to nonprofit and for-profit private agencies and organizations, including institutions of higher education, Indian tribes, and tribal organizations. The Secretary may make awards for up to 60 months through grants or cooperative agreements. The purpose of the awards is for planning and conducting research, demonstrations, and related activities leading to the development of methods, procedures, and devices that will benefit individuals with disabilities, especially those with the most severe disabilities.

Under the regulations for this program (see 34 CFR 351.32), the Secretary may establish research priorities by reserving funds to support particular research

activities.

The Secretary will announce the final funding priorities in a notice in the Federal Register. The final priorities will be determined by responses to this notice, available funds, and other considerations of the Department. Funding of particular projects depends on the final priorities, the availability of funds and the quality of the application received. The publication of these proposed priorities does not preclude the Secretary from proposing additional priorities, nor does it limit the Secretary to funding only these priorities, subject to meeting applicable rulemaking requirements.

Note: This notice of proposed priorities does not solicit applications. A notice inviting applications under this competition will be published in the Federal Register concurrent with or following publication of the notice of final priorities.

Priorities

Under 34 CFR 75.105(c)(3) the Secretary proposes to give an absolute preference to applications that meet one of the following priorities. The Secretary proposes to fund under this competition only applications that meet one of these absolute priorities:

Proposed Priority 1—Family, Psychosocial, and Transitional Issues of Children with Epilepsy

Background

According to the 1988 National Health Interview Survey, the incidence of epilepsy was 3.8 per thousand in the population (NCHS, 1989). The Epilepsy Foundation of America estimates that 2.5 million children and adults in America have epilepsy (New England Medical Center and Tufts University School of Medicine, 1991). Some 300,000 new cases of epileptic seizure occur annually in the United States, 40 percent of which affect individuals under age 18.

Epilepsy may also be accompanied by other disabilities. For example, epilepsy exists frequently in individuals with mental retardation, cerebral palsy, and

autism (McLin, 1991). The consequences of epilepsy are varied and dependent upon, among other factors, the severity of the seizure disorder, the degree of control and the understanding that the individual has, and the support that the child or adult has in coping with the disorder (McLin, 1991).

Children with epilepsy appear to have a higher incidence of adaptation problems than children with other chronic physical conditions (Matthews, 1982; Marglit and Hermann, 1983; Rutter, Graham, and Yule, 1970; Hoare, 1984; Scott, 1979). Little is known, however, about those factors that influence child adaptation to epilepsy (Austin, 1991). The poor self-concept and behavioral problems often exhibited by children with epilepsy have been attributed to problems in the family as a whole, particularly to high family stress and lack of social supports (Austin, 1991).

Other issues affecting adaptation include social support, diagnosis resolution, seizure type and control, child characteristics and types of parent-child interactions (Pianta, 1991). The consensus of existing research is that a direct relationship does not exist between improving seizure control and improving psychosocial functioning

(Parks-Trusz, 1991).

Priority

This proposed priority will support a Research and Demonstration project on childhood epilepsy to develop, demonstrate, evaluate, and disseminate findings about—

 An integrated approach to counseling parents, other family members, children with epilepsy, and teachers, administrators, and other students or peers about epilepsy;

 Techniques that might be used by parents, providers of services to children with epilepsy, and educators to foster a sense of independence and control among children with epilepsy;

 Methods to involve the child with epilepsy and the parents and other members of that child's family in the clinical and rehabilitation planning and care of the child, especially with regard to the appropriateness and timing of interventions and outcomes of the clinical and rehabilitation programs.

Proposed Priority 2—Model System for Burn Injury Rehabilitation

Background

More than 60,000 people are hospitalized in the United States each year for the treatment of burn injuries. With medical advances in burn care, people are surviving severe burns that cover more than 70 percent of the body surface. Burn patients undergo multiple operations for skin grafting and repeated admissions to hospitals for reconstructive surgery, and they live with permanent scarring. Individuals who incur severe burns are often left with functional limitations in reach, grasp, and sensation. A severe burn is considered by many to be the most devasting injury a person can survive (Locke, Rossignol, Boyle, and Burke, 1986). Fire and burn injuries cost \$3.8 billion annually (Cost of Injury in the United States, A Report to Congress, 1989).

Of the two million people in the United States burned each year, one-half will require medical attention or incur a burn severe enough to restrict daily activities in the home, school, or workplace. One-fourth of these injuries will require bed confinement. The recent report Healthy People 2000 notes that burns are complex to treat, carry higher risks, require longer hospitalization than other types of injuries, and cause more intense and more prolonged suffering than other traumas.

As defined by the American Burn Association Rehabilitation Committee, the rehabilitation of burn patients includes those therapeutic and social activities, both early and late, the primary goals of which are to restore, with safety and dignity, to fullest possible measure: (1) The individual's physical, psychological, cognitive, and social status, and (2) the role of the individual and the family in the home, school, work, social, and recreational environments.

Recent improvements in mortality rates are attributed to the expansion of specialized burn centers. Approximately one-third of all patients hospitalized for burns are treated yearly in these centers. However, a large number of patients do not remain at a burn center for outpatient treatment but receive care in local hospitals and private clinics (Helm, 1991). A survey of 114 burn centers conducted by the American Burn Association Rehabilitation Committee showed that: (1) One-third of centers with 1 to 80 admissions each year did not have outpatient programs; (2) onefifth of centers with 81-120 admissions each year did not have outpatient programs; and (3) only 12 percent of burn centers with over 121 admissions did not have outpatient programs. Outpatient care is a critical issue in burn rehabilitation service delivery, as is the provision of long-term social and psychological supports in the community.

Research indicates that early comprehensive and coordinated acute rehabilitation care is likely to improve the outcomes for this population. NIDRR proposes a priority that would (1) demonstrate a comprehensive, multidisciplinary model system of rehabilitative services for individuals with severe burns; and (2) evaluate the efficacy of that system through the collection and analysis of uniform data on system benefits, costs, and outcomes.

The model system demonstration and the collection of uniform and standardized data must be conducted within the context of a comprehensive program of services that coordinates all aspects of care and rehabilitation. The model system must include emergency medical services; intensive and acute medical and surgical care; comprehensive rehabilitation management; psychosocial adjustment services; educational and vocational preparation; and community reintegration with extended followalong services that promote independence and vocational success. Any projects to be funded under this priority must involve individuals with burn disabilities and their families in planning, implementing, evaluating, and disseminating project activities.

Priority

This proposed priority will support one or more Research and Demonstration projects for a model system for burn injury rehabilitation that will—

- Establish, demonstrate, and evaluate a multidisciplinary coordinated system of comprehensive rehabilitation that offers services to both children and adults with severe burns, from point of injury through intensive and acute medical surgical care, comprehensive medical rehabilitation, vocational rehabilitation, educational preparation, job placement, family and community participation, and long-term community followup;
- Conduct a scientific program of sitespecific and collaborative research to generate new information for reducing disability and for treating and rehabilitating individuals with severe burns and related complications;
- Demonstrate and evaluate the development and use of burn injury treatment and rehabilitation methods, equipment, and assistive technology essential to the care, management, and vocational rehabilitation of an individual surviving severe burns;
- Demonstrate and evaluate approaches to independent living, vocational rehabilitation, and

community reintegration for severely burned children and adults;

 Study the clinical course and physiological, family, psychosocial, educational, and vocational adjustment to burn impairments, with special attention to the developmental needs of children and adolescents; and

 Participate in clinical and systems analysis studies of the operations and effectiveness of the model system by contributing to a national database in burn injury treatment and rehabilitation to be prescribed by the Scretary.

INVITATION TO COMMENT: Interested persons are invited to submit comments and recommendations regarding these proposed priorities. All comments submitted in response to this notice will be available for public inspection, during and after the comment period, in room 3423, Mary Switzer Building, 330 C Street SW., Washington, DC, between the hours of 8 a.m. and 3:30 p.m., Monday through Friday of each week except Federal holidays.

APPLICABLE PROGRAM REGULATIONS: 34 CFR parts 350 and 351.

Program Authority: 29 U.S.C. 760–762. (Catalog of Federal Domestic Assistance Number 84.133A, Research and Demonstration Projects)

Dated: May 13, 1992.

Lamar Alexander,

Secretary of Education.

BILLING CODE 4000-01-M

DEPARTMENT OF ENERGY

Federal Energy Regulatory Commission

[Docket Nos. ER92-585-000, et al.]

Florida Power Corp., et al.; Electric Rate, Small Power Production, and Interlocking Directorate Filings

Take notice that the following filings have been made with the Commission:

1. Florida Power Corp.

[Docket No. ER92-585-000] June 3, 1992.

Take notice that on May 29, 1992, Florida Power Corporation (Florida Power) filed a supplement to the service agreement between itself and Tampa Electric Company (TECO) under Florida Power's T-1 Transmission Tariff. The supplement describes transmission service to be provided for TECO's service to the City of Wauschula beginning June 1, 1992. Florida Power requests that the supplement be allowed to become effective June 1, 1992.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

2. Northeast Utilities Service Co.

[Docket No. ER92-24-000] June 3, 1992.

Take notice that on June 1, 1992, the
Northeast Utilities Service Company as
agent for Connecticut Light and Power
Company and Western Massachusetts
Electric Company (NU) tendered for
filing supplemental information
regarding proposed rate schedules
between NU and Public Service
Company of New Hampshire (PSNH)
and Boston Edison Company (BE).

NU states that the amendment was filed in response to a request by the Commission for additional information.

NU states that copies of this filing has been mailed to PSNH and BE.

NU requests that the Commission waive its standard notice period and filing notice regulations to the extent necessary to permit the rate schedule orignally filed to become effective May 1, 1990.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

3. Duke Power Co.

[Docket No. ER92-541-000] June 3, 1992.

Take notice that Duke Power
Company (Duke Power) tendered for
filing on May 11, 1992, a supplement to
the Company's Electric Power Contract
with the City of Kings Mountain, N.C.
Duke Power states that this contract is
on file with the Commission and has
been designated Duke Power Company
Rate Schedule FERC No. 10.

Duke Power further indicates that the Company's contract supplement, made at the request of the customer and with agreement obtained from the customer, provides for decreased capacity as follows: Delivery Point No. 2 with a contracted demand of 6,500 KW.

Duke power indicates that this supplement also includes an estimate of sale and revenue for twelve months immediately succeeding the effective date. Duke Power proposes an effective date of December 20, 1991.

According to Duke Power, copies of this filing were mailed to Kings Mountain, North Carolina.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

Montaup Electric Co. and Newport Electric Corp.

[Docket No. ER91-301-001] June 3, 1992.

Take notice that on June 1, 1992, Montaup Electric Company (Montaup) and Newport Electric Corporation (Newport) filed a rate schedule revision and Montaup M-rate fuel clause revisions in compliance with the Commission's order approving the filing in this docket. The rate schedule revision makes explicit in the rate schedule the explanation provided to the FERC in a March 20, 1992 response to a deficiency letter that Montaup and Newport are each allocated (a) energy costs as if its net generation and purchases were dispatched on a standalone basis to meet its load and (b) onehalf of the energy affiliation savings resulting from dispatching their combined resources to meet their combined loads. The revised Montaup M-rate fuel clause revisions incorporate by reference in current period fuel cost, "F(c)." the costs and savings allocated to Montaup under the revised Montaup/ Newport rate schedule. Montaup and Newport request that the enclosed rate schedule and fuel clause revision be accepted for filing and permitted to become effective as of May 1, 1990 as provided in the Commission's order.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

5. The United Illuminating Co.

[Docket No. ER92-589-000] June 3, 1992.

Take notice that on May 29, 1992, The United Illuminating Company (UI) tendered for filing a rate schedule for a short-term, coordination transaction involving the sale of capacity entitlements to Green Mountain Power Corporation (GMP). The rate schedule corresponds to a letter agreement, dated April 27, 1992 between UI and GMP. The commencement date for service under the agreement is May 1, 1992. UI proposes that the rate schedule commence on this date.

The service provided under the agreement is the provision of capacity entitlements and associated energy from UI's New Haven Harbor Station.

Copies of the filing were mailed to GMP.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

8. Public Service Co. of New Hampshire

[Docket No. ER92-590-000] June 3, 1992.

Take notice that Public Service Company of New Hampshire (PSNH), on May 29, 1992, tendered for filing an Agreement For Sale of Capacity and Energy Between Public Service Company of New Hampshire and The Connecticut Light and Power Company and Western Massachusetts Electric Company, collectively known as the Northeast Utilities Service Companies (NU). The Agreement provides for the sale by PSNH to NU of capacity and energy from PSNH's entitlement in the Seabrook Unit #1 nuclear facility. PSNH asks that the Commission waive its notice period and filing requirements to allow the Agreement to become effective as of June 1, 1992.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

7. Central Vermont Public Service Corp.

[Docket No. ER92-594-000] June 3, 1992.

Take notice that Central Vermont Public Service Corporation (Central Vermont) on June 1, 1992, tendered for filing thirteen Service Agreements which provide for service pursuant to Central Vermont's FERC Electric Tariff No. 5.

Central Vermont requests that the Commission waive its notice requirement in order to allow the Service Agreements to become effective in accordance with their individual terms. In support of its requests Central Vermont states that it has arranged for the sale of power to the Village of Orleans pursuant to the Tariff and is engaged in discussion with others for potential power sales.

Comment date: June 17, 1992, in accordance with Standard Paragraph E end of this notice.

8. Tampa Electric Co.

[Docket No. ER92-591-000] June 3, 1992.

Take notice that on May 29, 1992,
Tampa Electric Company (Tampa
Electric) tendered for filing revised
Exhibits A-1 and A-2 to the Full
Requirements Service Agreement
between Tampa Electric and the Sebring
Utilities Commission (Sebring), showing
revised delivery point specifications for
service under the Agreement.

Tampa Electric proposes an effective date of March 25, 1992, for the Exhibits A-1 and A-2, and therefore requests waiver of the Commission's notice requirements.

Copies of the filing have been served on Sebring and the Florida Public Service Commission.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

9. Arizona Public Service Co.

[Docket No. ER92-579-000] June 3, 1992.

Take notice that on May 27, 1992, Arizona Public Service Company (Arizona) tendered for filing a Notice of Cancellation of the Off-Peak Power Sales Agreement between Arizona Power Pooling Association on behalf of Electrical District No. 2 and Arizona.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

10. Consumers Power Co.

[Docket Nos. ER92-331-001 and ER92-332-001]

June 3, 1992.

Take notice that on May 27, 1992, Consumers Power Company (Consumers) tendered for filing amendments to its Open Access Transmission Tariff providing for various classifications of firm and nonfirm transmission service which is available to eligible utilities, including PURPA Qualifying Facilities, independent power producers, and municipal and cooperative utilities. Consumers also tendered for filing amendments to its unexecuted Coordinated Agreement between Consumers and the Michigan Public Power Agency and Wolverine Power Supply Cooperative, Inc. These amendments conform the prior filings to the Commission's order dated April 30, 1992, and to commitments made by Consumers in prior pleadings in the above-referenced dockets. A copy of the filing was served on the Michigan Public Service Commission and parties to the above-referenced docket which have been consolidated for hearing and decision by the Commission's order dated April 30, 1992.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

11. Duke Power Co.

[Docket No. ER92-542-000] June 3, 1992.

Take notice that Duke Power Company (Duke Power) on May 11, 1992, tendered for filing a supplement to the Company's Electric Power Contract with the City of Kings Mountain, NC. Duke Power states that this contract is on file with the Commission and has been designated Duke Power Company Rate Schedule FERC No. 10.

Duke Power further states that the Company's contract supplement, made at the request of the customer and with agreement obtained from the customer, provides for a new delivery with capacity as follows: Delivery Point No. 3 with a contracted demand of 14,000 KW.

Duke Power indicates that this supplement also includes an estimate of sales and revenue for twelve months immediately succeeding the effective date. Duke Power proposes an effective date of November 26, 1991.

According to Duke Power, copies of the filing were mailed to Kings Mountain, North Carolina.

Comment date: June 17, 1992, in accordance with Standard Paragraph E at the end of this notice.

12. Central Vermont Public Service Corp.

[Docket No. ER92-588-000] June 4, 1992.

Take notice that on May 29, 1992, Central Vermont Public Service Corporation tendered for filing the Actual 1991 Cost Report required under Article 2.3(A) on Original Sheet No. 21 of FERC Electric Tariff, Original Volume no. 4, of Central Vermont Publice Service Corporation ("Company") under which the Company provides Unreserved System Power Service to the following Customers:

Lyndonville Electric Department Village of Ludlow Electric Light Department

Village of Johnson Water and Light Department

Village of Hyde Park Water and Light Department

Comment date: June 18, 1992, in accordance with Standard Paragraph E at the end of this notice.

13. Seminole Electric Cooperative, Inc v. Florida Power Corporation

[Docket No. EL92-30-000] June 4, 1992.

Take notice that on May 21, 1992, Seminole Electric Cooperative, Inc. (Seminole) filed a complaint against Florida Power Corporation (FPC). In its complaint Seminole seeks an order from the Commission: (1) Finding that the rates currently charged by FPC for partial requirements and transmission services under FPC FERC Rate Schedule 106 are unjust and unreasonable, produce excessive revenues from Seminole, and should be reduced; (2) establishing a refund-effective date of November 1, 1992; (3) finding that certain of the terms and conditions of service of FPC's FERC Rate Schedule

106 are unjust and unreasonable; (4) setting this matter for hearing for the purposes of (i) determining and fixing just and reasonable rates for the services at issue, (ii) determining and fixing appropriate changes to the terms and conditions of service to Seminole; and (iii) determining the appropriate amount of, and ordering, refunds; (5) ordering consolidation of the consideration of the matters raised by this complaint with the ongoing proceedings in Docket No. ER92-436-000; and (6) affording Seminole such other relief as may be warranted.

Comment date: July 6, 1992, in accordance with Standard Paragraph E at the end of this notice.

14. Pacific Gas and Electric Co.

[Docket No. ER92-596-000]

June 4, 1992.

Take notice that on June 1, 1992,
Pacific Gas and Electric Company
(PG&E) tendered for filing proposed
changes to certain rates, terms, and
conditions concerning certain services
rendered by PG&E to the Department of
Water Resources of the State of
California (DWR) as reflected in: (1) A
new Rate Settlement Agreement which
amends Rate Schedule FERC No. 77; and
(2) amendments modifying Rate
Schedule FERC Nos. 92, 93, 94 and 100.

The filing seeks an overall decrease to the transmission rates and revision of the special facilities charges under the DWR Comprehensive Agreement, Rate Schedule FERC No. 77. The filing also seeks to change the rate basis in Rate Schedule FERC Nos. 92, 93, 94 and 100 from PG&E's system average ownership charge for transmission facilities to the California Public Utilities Commission's (CPUC) PG&E Electric Rule No. 2 Cost of Ownership Rate for transmission-level, customer-financed Special Facilities. In addition, this filing requests automatic rate adjustments for both the transmission rates and all of the special facilities charges.

Copies of this filing were served upon DWR and the CPUC.

Comment date: June 18, 1992, in accordance with Standard Paragraph E at the end of this notice.

15. Central Vermont Public Service Corp.

[Docket No. ER92-587-000] June 4, 1992.

Take notice that on May 29, 1992, Central Vermont Public Service Corporation (Central Vermont) tendered for filing its Actual 1991 Cost Report required under Article 2.4 on Second Revised Sheet No. 18 of FERC Electric Tariff, Original Volume No. 3, of Central Vermont under which Central Vermont provides transmission and distribution service to the following Customers: Vermont Electric Cooperative, Inc. Lyndonville Electric Department Village of Ludlow Electric Light

Department Village of Johnson Water and Light Department

Rochester Electric Light and Power Company

Comment date: June 18, 1992, in accordance with Standard Paragraph E at the end of this notice.

16. City of Vernon, California v. Pacific Gas and Electric Co.; Southern California Edison Co., and San Diego Gas and Electric Co.

[Docket No. EL92-32-000] June 4, 1992.

Take notice that on May 28, 1992, the City of Vernon, California (Vernon) tendered for filing an application for an order prescribing terms and conditions for interconnection and coordinated operation of the California-Oregon Transmission Project with what Vernon describes as essential facilities of the Pacific Gas and Electric Company and the Pacific AC Intertie which Vernon states is owned and operated principally by the three named respondents.

Comment date: July 6, 1992, in accordance with Standard Paragraph E at the end of this notice.

17. Central Vermont Public Service Corp.

[Docket No. ER92-586-000] June 4, 1992.

Take notice that on May 29, 1992, Central Vermont Public Service Corporation tendered for filing the Actual 1991 Cost Report required under Paragraph Q-1 on Original Sheet No. 18 of the Rate Schedule FERC No. 135 ("RS-2 rate schedule") under which Central Vermont Public Service Corporation (Company) sells electric power to Connecticut Valley Electric Company Inc. (Customer). The Company states that the Cost Report reflects changes to the RS-2 rate schedule which were approved by the Commission's June 6, 1989 order in Docket No. ER88-456-000.

Comment date: June 18, 1992, in accordance with Standard Paragraph E at the end of this notice.

Standard Paragraphs

E. Any person desiring to be heard or to protest said filing should file a motion to intervene or protest with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, in accordance with Rules 211 and 214 of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214). All such motions or protests should be filed on or before the comment date. Protests will be considered by the Commission in determining the appropriate action to be taken, but will not serve to make protestants parties to the proceeding. Any person wishing to become a party must file a motion to intervene. Copies of this filing are on file with the Commission and are available for public inspection.

Lois D. Cashell,

Secretary.

[FR Doc. 92-13822 Filed 6-11-92; 8:45 am] BILLING CODE 6717-01-M

[Docket Nos. CP90-2294-003, et al.]

Transwestern Pipline Co. et al.; Natural. Gas Certificate Filings

Take notice that the following filings have been made with the Commission:

1. Transwestern Pipeline Co.

[Docket No. CP90-2294-003] June 3, 1992.

Take notice that on May 22, 1992, Transwestern Pipeline Company (Transwestern), 1400 Smith Street, P.O. Box 1188, Houston, Texas 77251–1188, filed in Docket No. CP90–2294–003, pursuant to section 7 of the Natural Gas Act, to amend its certificate of public convenience and necessity to authorize construction and operation of approximately 4.3 miles of additional 6-inch pipeline facilities in Coconino County, Arizona, all as more fully set forth in the application which is on file with the Commission and is open to public inspection.

Transwestern requests that the Commission amend its previous Orders in this docket to authorize Transwestern to construct approximately 7.6 miles of 6-inch pipeline from Transwestern's mainline facilities in Coconino County. Arizona to an interconnect near Flagstaff, Coconino County, Arizona. Transwestern plans to construct these facilities in lieu of the 3.0 miles of 6-inch pipeline presently authorized by the Commission's Orders in Docket No. CP90-2294. Transwestern requests the Commission to grant expeditious authorization so these facilities can be completed and placed into service prior to the 1992-1993 winter heating season.

Comment date: June 24, 1992, in accordance with the first subparagraph of Standard Paragraph F at the end of this notice.

2. Tarpon Transmission Co.

[Docket No. CP92-522-000] June 3, 1992.

Take notice that on May 28, 1992, **Tarpon Transmission Company** (Tarpon), Suite 1320, 300 Crescent Court, Dallas, Texas 75201, filed in Docket No. CP92-522-000 a petition pursuant to Rule 207(a)(2) of the Commission's Rules of Practice and Procedure, [18 CFR 385.207(a)(2)), for a declaratory order (1) finding that Tarpon's offshore facilities are gathering facilities exempt from Commission jurisdiction pursuant to Section 1(b) of the Natural Gas Act and (2) vacating the orders issuing and amending the certificates of public convenience and necessity in Docket Nos. CP77-315 and CP88-89-000, all as more fully set forth in the petition which is on file with the Commission and open to public inspection.

Tarpon states that its pipeline system consists of a 40.4-mile long, 16-inch diameter pipeline and appurtenant facilities originating at a production platform located in Eugene Island Block 380-A on the Outer Continental Shelf, offshore Louisiana and extending in a generally northeasterly direction to its terminus at an interconnection with Trunkline Gas Company's (Trunkline) facilities in Block 274 of the Ship Shoal Area, South Addition. Tarpon further states that it receives gas from Block 380 and Block 174, South Marsh Island Area, South Addition and from Block 361 Eugene Island Area, South Addition, for delivery to Trunkline.

Tarpon explains that the sole purpose of its facilities, which are located in a producing area and operate without processing or compression, is to function as a gathering system to deliver gas from numerous wells in several offshore blocks to Trunkline.

Tarpon further explains that it sought certificate authourity only because at the time of its application, Commission procedent and policy indicated that certificate authority was necessary for the construction and operation of such facilities.

Tarpon asserts that its facilities meet the Commission's present modified primary function test for gathering facilities and therefore requests that the Commission find that the Tarpon pipeline system is a gathering system and therefore exempt from the Commission's Regulations pursuant to section 1(b) of the NGA. Tarpon further requests that its certificates in Docket Nos. CP77–315 and CP88–89–00 be rescinded.

Comment date: June 24, 1992, in accordance with the first subparagraph

of Standard Paragraph F at the end of this notice.

3. Transcontinental Gas Pipe Line

[Docket No. CP92-516-000] June 3, 1992.

Take notice that on May 26, 1992,
Transcontinental Gas Pipe Line
Corporation (Transco), P.O. Box 1396,
Houston, Texas 77251, filed in Docket
No. CP92–516–000 an application
pursuant to section 7(b) of the Natural
Gas Act for permission and approval to
abandon a transporation service
between Transco and CNG
Transmission Corporation (CNG), all as
more fully set forth in the application
which is on file with the Commission
and open to public inspection.

Transco proposes to abandon the transportation service provided under a transportation service agreement (agreement) between Transco and CNG dated April 12, 1978, under Transco's Rate Schedule X-56, to be effective the first day of the first calendar month following Commission approval. Transco states that Transco transports. pursuant to the agreement, up to the dekatherm (dt) equivalent of 71,548 Mcf of natural gas per day, on a firm basis, and up to an additional 100,000 dt of natural gas per day on an interruptible basis delivered by CNG at various points on Transco's system to a primary delivery point of interconnection between Transco and CNG in Clinton County, Pennsylvania. Since the agreement contains no notice requirement upon expiration of the term on October 31, 1992, Transco and CNG have agreed to the termination of the agreement, it is indicated.

However, Transco states that CNG has agreed to the abandonment of Rate Schedule X-56 on the condition that Transco provide CNG replacement firm and interruptible transportation service pursuant to Transco's blanket certificate authorization under Rate Schedules FT and IT. The replacement transportation service would provide for the same firm and interruptible volumes and would be available from the receipt points currently provided for under Rate Schedule X-56, as well as from other mutually agreeable receipt points in accordance with Transco's Rate Schedules FT and IT, to CNG's existing delivery points and other mutually agreeable points, it is stated. Transco, also, requests that the Commission confirm that pregranted abandonment should not apply to the replacement service agreement for the long term FT service to be provided to CNG.

In order to provide CNG replacement service under Rate Schedule FT,

Transco requests waiver of section 8.1 of Transco's Rate Scheduler FT which requires Transco to treat all requests for service received during a period of 21 days after Transco announces availability of firm capacity (21-day window) as if those requests were received on the same day. Transco states that waiver of the 21-day window would allow firm transportation service to continue for CNG under Transco's Rate Schedule FT through capacity which has been reserved for CNG under Rate Schedule X-56. In addition. Transco requests waiver of the applicable provisions of the General Terms and Conditions in its FERC Gas Tariff to the extent necessary to allow replacement interruptible transportation service under Rate Schedule IT for CNG to maintain the same queue priority as that which exists under Rate Schedule X-56. The replacement interruptible transportation service under Rate Schedule IT would not be a new service but rather a conversion of regulatory authorizations, it is stated.

No facilities are proposed to be abandoned herein.

Comment date: June 24, 1992, in accordance with Standard Paragraph F at the end of this notice.

4. Southwest Royalties, Inc.

[Docket No. CS92-8-000] June 3, 1992.

Take notice that on May 27, 1992,
Southwest Royalties, Inc., (Southwest)
of P.O. Box 11390, Midland Texas 79702,
filed an application requesting a small
producer certificate of public
convenience and necessity. Southwest
requests authorization to make sale for
resale of natural gas in interstate
commerce, as set forth in the application
which is on file with the Commission
and open to public inspection.

Comment date: June 19, 1992, in accordance with Standard Paragraph J at the end of this notice.

5. GEMCO Gas Marketing Inc. and Allegheny Energy Marketing Co.

[Docket Nos. Cl92-53-000, Cl92-54-000] June 4, 1992.

Take notice that on May 19, 1992, GEMCO Gas Marketing Inc. (GEMCO) and Allegheny Energy Marketing Company (Allegheny) of 109 Northpark Boulevard, P.O. Box 3134, Covington, Louisiana 70434–3134, filed applications under sections 4 and 7 of the Natural Gas Act (NGA) for unlimited-term blanket certificates with pregranted abandonment authorizing sales in interstate commerce for resale of natural gas subject to the Commission's NGA jurisdiction, imported natural gas, and

gas purchased from non-first sellers such as interstate pipelines, intrastate pipelines and local distribution companies. GEMCO's and Allegheny's applications are on file with the Commission and open for public inspection.

Comment date: June 24, 1992, in accordance with Standard Paragraph J at the end of this notice.

6. Gateway Pipeline Co.

[Docket No. CP89-471-006] June 4, 1992.

Take notice that on May 26, 1992, Gateway Pipeline Company (Gateway) tendered for filing the following tariff sheets to its FERC Gas Tariff, Original Volume No. 1, with an effective date of April 24, 1992.

Substitute First Revised Sheet No. 4 Substitute Original Sheet No. 13 Substitute Original Sheet No. 16 Substitute Original Sheet No. 30 Substitute Original Sheet No. 30 Substitute Original Sheet No. 32 Substitute Original Sheet No. 36 Substitute Original Sheet No. 36 Substitute Original Sheet No. 37 Substitute Original Sheet No. 38 Substitute Original Sheet No. 38 Substitute Original Sheet No. 54

Gateway states that in its April 23, 1992 order the Commission tolled Gateway's request for a reduction of the load factor for usage rates from 95 percent of capacity to 90 percent of capacity. Thereinafter the Commission recalculated Gateway's FT and IT maximum usage rates based upon 95 percent load factor of capacity, which produced an usage rate of \$.0285. The Commission calculated the usage rate with the amended facility costs and SFV rate design filed in CP89-471-005 and approved by the April 23, 1992 order. Gateway states that the usage rate is reflected on Substitute First Revised Sheet No. 4.

Gateway also states that the Commission directed Gateway to revise section 9(c) of Rate Schedule FTS to provide for an overrun penalty, rather than for the retention of gas in overrun situations with an interruption order. Gateway states that it has removed the retention provision and added an overrun penalty of \$2.00 per Mcf for tenders in excess of 110% of quantities specified in an interruption order, consistent with Section 9(d) of Rate Schedule ITS. Gateway states that the change is reflected on Substituted Original Sheet No. 16.

Gateway states that it is serving the filling on all parties on the service list in the above reference docket.

Comment date: June 11, 1992, in accordance with the first subparagraph

of Standard Paragraph J at the end of this notice.

7. Southern Natural Gas Co.

[Docket No. CP92-523-000] June 4, 1992.

Take notice that on May 29, 1992, Southern Natural Gas Company (Southern), P.O. Box 2563, Birmingham, Alabama 35202-7114, filed in Docket No. CP92-523-000 as request pursuant to §§ 157.212 and 157.216 of the Commission's Regulations under the Natural Gas Act to abandon a meter station, rebuild a meter station and provide higher contract pressure, and consolidate sales contract demands at various delivery pints for Atlanta Gas Light Company (AGL) in Georgia, under the Southern's blanket certificate authority in Docket No. CP82-406-000, all as more fully set forth in the application on file with the Commission and open to public inspection.

It is stated that at the request of AGL, Southern proposes to abandon the Harlem Meter Station serving AGL and to consolidate the sales contract demand specified for said station with deliveries to AGL under the Augusta Area delivery point. It is also stated that such consolidation does not require the construction of any new facilities. Southern also requests authorization to rebuild the East Point Meter Station serving AGL because it is obsolete. Southern also states that in conjunction with rebuilding the station Southern requests authorization to move the regulators and to delivery AGL mainline contract pressure between 200 psig and 385 psig. Finally, Southern states that AGL has requested that Southern revise Exhibit A to their sales service agreement to include the Hampton Meter Station with AGL's Atlanta Area delivery point and to include the Jeffersonville Meter Station in the Macon Area delivery point. These latter changes require no additional facilities. it is stated. It is further stated that these proposed activities would cause no change in AGL's total sales contract demand and could be accomplished without detriment or disadvantage to Southern's other customers.

Comment date: July 20, 1992, in accordance with Standard Paragraph G at the end of this notice.

8. Northwest Pipeline Corp. and The Washington Water Power Co.

[Docket No. CP92-247-001]

June 4, 1992

Take notice that on May 26, 1992, Northwest Pipeline Corporation (Northwest), 295 Chipeta Way, Salt Lake City, Utah 84158, and the Washington Water Power Company (Water Power). East 1411 Mission Avenue, Spokane, Washington 99202, jointly filed in Docket No. CP92-247-001, pursuant to sections 7(b) and 7(c) of the Natural Gas Act, an amendment to Northwest's application pending in Docket No. CP92-247-000 in order to incorporate, in conjunction with the service changes sought by Northwest in the original application herein, a request for any additional certificate modifications necessary to sanction the temporary, partial releases to BC Gas, Inc. (BC Gas) of Water Power's best-efforts storage entitlements in the Jackson Prairie storage field; all as more fully set forth in the amendment which is on file with the Commission and available for public inspection.

It is said that, in order to effectuate Water Power's best-efforts storage release to BC Gas, Northwest filed an application in Docket No. CP92-247-000 pursuant to section 7(b) and 7(c) for approvals to: (1) Implement temporary partial abandonments of up to 19,000 Dth per day of best-efforts storage service for Water Power at the Jackson Prairie storage field under Northwest's Rate Schedule SGS-1, consistent with an agreed upon release of such storage capacity between Water Power and BC Gas, and (2) amend the certificated Rate Schedule X-82 transportation service which Northwest currently provides for Water Power, for the account of BC Gas, in order to provide additional flexibility and interruptible capacity for the transportation of BC Gas storage volumes to and from Jackson Prairie.

In addition to the authorizations specifically requested in Northwest's original application herein, Northwest and Water Power hereby request an amendment of Water Power's existing certificate authorization for storage capacity releases to BC Gas under its April 21, 1989, Release Agreement to the extent necessary to authorize the temporary additional releases to BC Gas on a day-by-day basis of up to 19,000 Dth per day of Water Power's rights to Jackson Prairie storage deliverability on a best-efforts basis, pursuant to the November 30, 1990, amendment to the Release Agreement.

It is said that the day-by-day release of any best efforts capacity requested by BC Gas will be subject to approval by both Water Power and Washington Natural Gas Company, the Jackson Prairie Project Operator.

Comment date: June 25, 1992, in accordance with the first subparagraph of Standard Paragraph F at the end of this notice.

Standard Paragraphs

F. Any person desiring to be heard or make any protest with reference to said file with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426, a motion to intervene or a protest in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 385.211 and 385.214) and the Regulations under the Natural Gas Act (18 CFR 157.10). All protests filed with the Commission will be considered by it in determining the appropriate action to be taken but will not serve to make the protestants parties to the proceeding. Any person wishing to become a party to a proceeding or to participate as a party in any hearing therein must file a motion to intervene in accordance with the Commission's Rules.

Take further notice that, pursuant to the authority contained in and subject to jurisdiction conferred upon the Federal **Energy Regulatory Commission by** sections 7 and 15 of the Natural Gas Act and the Commission's Rules of Practice and Procedure, a hearing will be held without further notice before the Commission or its designee on this filing if no motion to intervene is filed within the time required herein, if the Commission on its own review of the matter finds that a grant of the certificate is required by the public convenience and necessity. If a motion for leave to intervene is timely filed, or if the Commission on its own motion belives that a formal hearing is required. further notice of such hearing will be duly given.

Under the procedure herein provided for, unless otherwise advised, it will be unnecessary for the applicant to appear or be represented at the hearing.

G. Any person or the Commission's staff may, within 45 days after the issuance of the instant notice by the Commission, file pursuant to Rule 214 of the Commission's Procedural Rules (18 CFR 385.214) a motion to intervene or notice of intervention and pursuant to § 157.205 of the Regulations under the Natural Gas Act (18 CFR 157.205) a protest to the request. If no protest is filed within the time allowed therefore, the proposed activity shall be deemed to be authorized effective the day after the time allowed for filing a protest. If a protest is filed and not withdrawn within 30 days after the time allowed for filing a protest, the instant request shall be treated as an application for authorization pursuant to section 7 of the Natural Gas Act.

J. Any person desiring to be heard or make any protest with reference to said filings should on or before the comment date file with the Federal Energy Regulatory Commission, 825 North Capitol Street, NE., Washington, DC 20426 a motion to intervene or a protest in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR §385.211, .214). All protests filed with the Commission will be considered by it in determing the appropriate action to be taken but will not serve to make the protestants parties to the proceeding. Any person wishing to become a party in any proceeding herein must file a petition to intervene in accordance with the Commission's rules.

Under the procedure herein provided for, unless otherwise advised, it will be unnecessary for the applicant to appear or be represented at the hearing. Lois D. Cashell,

Secretary.

Office of Fossil Energy

[FE Docket No. 92-26-NG]

Energy International Marketing Corp.; Order Granting Blanket Authorization To Import and Export Natural Gas and Liquefied Natural Gas

AGENCY: Office of Fossil Energy, DOE.
ACTION: Notice of Order.

summary: The Office of Fossil Energy of the Department of Energy gives notice that it has issued an order granting ENERGY International Marketing Corporation blanket authorization to import from any foreign country and to export to any foreign country a combined total of up to 200 Bcf of natural gas, including liquefied natural gas, over a two-year period beginning on the date of first delivery.

A copy of this order is available for inspection and copying in the Office of Fuels Programs Docket Room, 3F-056, Forrestal Building, 1000 Independence Avenue, SW., Washington, DC 20585, (202) 586-9478. The docket room is open between the hours of 8 a.m. and 4:30 p.m., Monday through Friday, except Federal holidays.

Issue in Washington, DC, June 5, 1992. Charles F. Vacek,

Deputy Assistant Secretary for Fuels Program, Office of Fossil Energy. [FR Doc. 92-13909 Filed 6-11-92; 8:45 am] BILLING CODE 8450-01-M

[FE Docket No. 92-25-NG]

UNIGAS Corp.; Order Granting Blanket Authorization To Import and Export Natural Gas, Including Liquefied Natural Gas, From and to Canada, Mexico and Other Foreign Countries

AGENCY: Office of Fossil Energy, DOE.
ACTION: Notice of order.

summary: The Office of Fossil Energy of the Department of Energy gives notice that it has issued an order granting Unigas Corporation blanket authorization to import and export up to 200 Bcf of natural gas from and to Canada, Mexico and other foreign countries over a two-year term beginning on the date of the first import or export.

A copy of this order is available for inspection and copying in the Office of Fuels Programs Docket Room, 3F-056, Forrestal Building, 1000 Independence Avenue, SW., Washington, DC 20585, (202) 586-9478. ENVIRONMENTAL PROTECTION AGENCY

[ER-FRL-4142-4]

Environmental Impact Statements and Regulations; Availability of EPA Comments

Availability of EPA comments prepared May 25, 1992 Through May 29, 1992 pursuant to the Environmental Review Process (ERP), under section 309 of the Clean Air Act and section 102(2)(c) of the National Environmental Policy Act as amended. Requests for copies of EPA comments can be directed to the Office of Federal Activities at (202) 260-5076.

An explanation of the ratings assigned to draft environmental impact statements (EISs) was published in FR dated April 10, 1992 (57 FR 12499).

Draft EISs

ERP No. D-AFS-L65164-ID Rating EC2, Mex Mountain Area Timber Harvest, Implementation, Clearwater National Forest, Lochsa Ranger District, Idaho County, ID.

Summary: EPA expressed environmental concerns regarding

potential project impacts to water quality in a Designated Stream Segment of Concern; the potential for adverse air quality impacts in a Class I airshed; and the potential for impacts to a federally-listed endangered species (gray wolf).

ERP No. D-AFS-L65165-WA Rating EC2, Breezin Timber Sales Management Plan, Implementation, Olympic National Forest, Quilcene Ranger District, Clallam and Jefferson Counties, WA.

Summary: EPA expressed
environmental concerns based on the
potential for adverse water quality and
air quality effects. Additional
information is needed to describe the
effectiveness of mitigation measures,
clarify water quality and wetland
effects, update information on the
threatened Northern Spotted Owl,
present a broader analysis of cumulative
effects, and evaluate noise effects from
helicopter logging.

ERP No. D-COE-K36106-CA Rating E02, Folsom Dam and Reservoir Reoperation Plan and Flood Control for portions of the Sacramento Metropolitan Area, Implementation, Sacramento County, CA.

Summary: EPA expressed environmental objections with the proposed action and identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment: water temperature increases and reduced flows that may significantly reduce future population sizes of the fall-run Chnook salmon, the permanent loss of marsh and riparian habitats, and increased salinities in the lower Sacramento River basin. The DEIS did not provide sufficient information on other feasible alternatives, potential impacts to the Federal candidate or sensitive species and potential cumulative impacts.

ERP No. D-FAA-L51014-WA Rating EC2, Seattle-Tacoma International Airport Improvement, South Aviation Support Area, Airport Layout Plan, Airport Master Plan, Funding, Section 10 and 404 Permits and NPDES Permit, Port of Seattle, King County, WA.

Summary: EPA expressed environmental concerns about the potential effects to land and aquatic resources. Additional information is needed on alternatives to prevent wetland losses, mitigation plans and noise impacts.

ERP No. DS-UMT-K54019-HI Rating L01, Honolulu Rapid Transit System Improvements, Additional Information, Waiaua through downtown Honolulu to Waikiki and the University of Hawaii, Funding, Coast Guard Bridge, EPA and Possible COE Permits, Honolulu County, HI.

Summary: EPA expressed a lack of objections with the action proposed, although it did request additional clarification in the FEIS on surface and ground water issues, underground storage tanks and Clean Air Act conformity.

Final EISs

ERP No. F-AFS-K65137-CA
Cottonwood and Golf Timber Sales,
Implementation, Timber Harvesting in
the Breckenridge Compartment, Sequoia
National Forest, Greenhorn Ranger
District, Kern County, CA.

Summary: Review of the Final EIS was not deemed necessary. No formal letter was sent to the agency.

EIS No. F-UAF-K11049-CA Mather Air Force Base Disposal and Reuse, Implementation, Sacramento County, CA.

Summary: EPA expressed objections because the FEIS does not contain the level of detail necessary to ensure that reuse decisions will provide for appropriate protection of air quality, groundwater quality and wetlands. The Air Force was encouraged to reexamine the full range of EPA's earlier concerns and provide more specific responses in the Record of Decision (ROD). Supplemental environmental documentation (if additional specifics cannot be provided in the ROD) and environmental protection stipulations attached to the property conveyance were also recommended.

Dated: June 9, 1992.

Public Water System Supervision Program Revision for the State of Montana

AGENCY: Environmental Protection Agency (EPA). ACTION: Notice.

SUMMARY: Public notice is hereby given in accordance with the provisions of Section 1413 of the Safe Drinking Water Act as amended, 42 U.S.C. 300f et seq., and 40 CFR 142.10, the National Primary Drinking Water Regulations, that the State of Montana has revised its approved Public Water System Supervision (PWSS) Primacy Program. Montana has developed drinking water regulations for filtration, disinfection, turbidity, Giaradia Lamblia, viruses, Legionella and heterotrophic bacteria that correspond to the National Primary Drinking Water Regulations for filtration, disinfection, turbidity, Giardia Lamblia, viruses, Legionella and heterotrophic bacteria promulgated by EPA on June 29, 1989 (FR Vol. 54, No. 124, pg. 25690). EPA has determined that this State program revision is no less stringent than the corresponding federal regulation and has approved this State program revision. This determination shall become effective July 13, 1992 and was based on a thorough evaluation of Montana's PWSS program which has met the requirements stated in 40 CFR 142.10.

Montana's PWSS program, as presented and evaluated, has indicated that it is fully capable of carrying out all of the areas required to achieve primary enforcement capability. Any interested parties are invited to submit written comments on this determination, and may request a public hearing on or before July 13, 1992. If a public hearing is requested and granted, this determination shall not become effective until such time following the hearing that the Regional Administrator issues an order affirming or rescinding this action.

Requests for a public hearing should be addressed to: Jack W. McGraw, Acting Regional Administrator, U.S. Environmental Protection Agency, Region VIII, 999 18th Street, suite 500, Denver, CO 80202–2466.

Frivolous or insubstantial requests for a hearing may be denied by the Regional Administrator. However, if a substantial request is made within thirty (30) days after this notice, a public hearing will be held.

Any request for a public hearing shall include the following (1) the name, address, and telephone number of the individual organization, or other entity requesting a hearing; (2) a brief statement of the requesting person's interest in the Regional Administrator's determination and of information that the requesting person intends to submit at such hearing; and (3) the signature of the individual making the requests, or, if the request is made on behalf of an organization or other entity, and signature of the responsible official of the organization or other entity.

Notice of any hearing shall be given not less than fifteen (15) days prior to the time scheduled for the hearing. Such notice will be made by the Regional Administrator in the Federal Register and in newspapers of general circulation in the State of Montana. A notice will also be sent to the person(s) requesting the hearing as well as to the State of Montana. The hearing notice will include a statement of purpose, information regarding time and location, and the address and telephone number where interested persons may obtain further information. The Regional Administrator will issue an order affirming or rescinding his determination upon review of the hearing record. Should the determination be affirmed, it will become effective as of the date of the order.

Should no timely and appropriate request for a hearing be received, and the Regional Administrator does not elect to hold a hearing on his own motion, this determination shall become effective on July 13, 1992.

Please bring this notice to the attention of any persons known by you to have an interest in this determination.

All documents relating to this determination are available for inspecton at the following locations: U.S. EPA Region VIII Regional Library, 999 18th Street, Denver, Colorado 80202–2466, between the hours of 10 a.m. and 4 p.m. (M.D.T.), Mon-Fri. and the MT Department of Health and Environmental Sciences, Drinking Water/Subdivision Section, Cogswell Building, Helena, Montana 59620 between the hours of 8 a.m. and 5 p.m. (M.D.T.), Mon-Fri.

FOR FURTHER INFORMATION CONTACT: Robert Clement, EPA Region VIII, Public Water Supply Program Section (8WM– DW) at the Denver address given above, telephone (303) 293–1417. Dated: May 29, 1992. Jack W. McGraw,

Acting Regional Administrator, EPA, Region VIII

[FRL-4143-5]

Proposed Administrative Settlement Under Section 122(h) of the Comprehensive Environmental Response, Compensation, and Liability Act; Burgess Brothers Superfund Site, Woodford and Bennington, VT

AGENCY: U.S. Environmental Protection Agency.

ACTION: Notice of proposed administrative settlement and request for public comment.

SUMMARY: The U.S. Environmental Protection Agency (EPA) is proposing to enter into an administrative settlement to address claims under the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended (CERCLA), 42 U.S.C. 9601. Notice is being published to inform the public of the proposed settlement and of the opportunity to comment. The settlement is intended to resolve the liability under CERCLA of Burgess Brothers, Inc., Eveready Battery Company and Clyde Burgess, Jr. for costs incurred by EPA in conducting response actions at the Burgess Brothers Superfund Site in Woodford and Bennington, Vermont as of April 16. 1991.

DATES: Comments must be provided on or before July 13, 1992.

ADDRESSES: Comments should be addressed to the Docket Clerk, U.S. Environmental Protection Agency, Region I, JFK Federal Building—RCG, Boston, Massachusetts 02203, and should refer to: In the Matter of Burgess Brothers Superfund Site, Bennington, VT, U.S. EPA Docket No. I-91-1101.

FOR FURTHER INFORMATION CONTACT: Rona Gregory, U.S. Environmental Protection Agency, Office of Regional Counsel, RCU, J.F.K. Federal Building, Boston, Massachusetts 02203, (617) 565– 3051,

SUPPLEMENTARY INFORMATION: In accordance with section 122(i)(1) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended (CERCLA), 42 U.S.C. 9622(i)(1), notice is hereby given of a proposed administrative settlement concerning the Burgess Brothers Superfund Site in Woodford and Bennington, VT. The settlement was approved by EPA Region I on June 2,

1992 subject to review by the public pursuant to this Notice. Burgess Brothers, Inc., Eveready Battery Company and Clyde Burgess, Jr., the Settling Parties, have executed signature pages committing them to participate in the settlement. Under the proposed settlement, the Settling Parties are required to pay \$72,797.51 to the Hazardous Substances Superfund. EPA believes the settlement is fair and in the public interest.

EPA is entering into this agreement under the authority of section 122(h) of CERCLA. Section 122(h) of CERCLA provides EPA with authority to consider, compromise, and settle a claim under section 107 of CERCLA for costs incurred by the United States if the claim has not been referred to the U.S. Department of Justice for further action. The U.S. Department of Justice approved this settlement in writing on May 13, 1992.

EPA will receive written comments relating to this settlement for thirty (30) days from the date of publication of this Notice.

A copy of the proposed administrative settlement may be obtained in person or by mail from Rona Gregory, U.S. Environmental Protection Agency, Office of Regional Counsel, JFK Federal Building—RCU, Boston, Massachusetts 02203, (617) 565–3051.

The Agency's response to any comments received will be available for public inspection with the Docket Clerk, U.S. Environmental Protection Agency, Region I, JFK Federal Building—RCG, Boston, Massachusetts (U.S. EPA Docket No. I-91-1101).

Dated: June 2, 1992.
Julie Belaga,
Regional Administrator.

[OPPTS-59308A; FRL 4070-9]

Certain chemicals; Approval of a Test Marketing Exemption

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: This notice announces EPA's approval of an application for test marketing exemption (TME) under section 5(h)(1) of the Toxic Substances Control Act (TSCA) and 40 CFR 720.38. EPA has designated this application as TME-92-10. The test marketing conditions are described below.

EFFECTIVE DATE: June 4, 1992.

FOR FURTHER INFORMATION CONTACT:
Darlene Jones, New Chemicals Branch,
Chemical Control Division (TS-794),
Office of Pollution Prevention and
Toxics, Environmental Protection
Agency, rm. E-613, 401 M St. SW.,
Washington, D.C. 20460, (202) 260-2279.

SUPPLEMENTARY INFORMATION: Section 5(h)(1) of TSCA authorizes EPA to exempt persons from premanufacture notification (PMN) requirements and permit them to manufacture or import new chemical substances for test marketing purposes if the Agency finds that the manufacture, processing, distribution in commerce, use, and disposal of the substances for test marketing purposes will not present an unreasonable risk of injury to human health or the environment. EPA may impose restrictions on test marketing activities and may modify or revoke a test marketing exemption upon receipt of new information which casts significant doubt on its finding that the test marketing activity will not present an unreasonable risk of injury

EPA hereby approves TME-92-10.
EPA has determined that test marketing of the new chemical substance described below, under the conditions set out in the TME application, and for the time period and restrictions specified below, will not present an unreasonable risk of injury to human health or the environment. Production volume, use, and the number of customers must not exceed that specified in the application. All other conditions and restrictions described in the application and in this notice must be met.

The following additional restrictions apply to TME-92-10. A bill of lading accompanying each shipment must state that the use of the substance is restricted to that approved in the TME. In addition, the applicant shall maintain the following records until 5 years after the date they are created, and shall make them available for inspection or copying in accordance with section 11 of TSCA:

- Records of the quantity of the TME substance produced and the date of manufacture.
- Records of dates of the shipments to each customer and the quantities supplied in each shipment.
- Copies of the bill of lading that accompanies each shipment of the TME substance.

TME-92-10

Date of Receipt: May 4, 1992. Notice of Receipt: May 19, 1992 (57 FR 21244).

Applicant: Confidential. Chemical: (G) Fatty acid esters of trimethylolpropane.

Use: (G) Metal working fluid. Production Volume: Confidential. Number of Customers: Confidential. Test Marketing Period: Confidential. Risk Assessment: EPA identified no significant health or environmental concerns for the test market substance. Therefore, the test market activities will not present any unreasonable risk of injury to human health or the environment.

The Agency reserves the right to rescind approval or modify the conditions and restrictions of an exemption should any new information that comes to its attention cast significant doubt on its finding that the test marketing activities will not present any unreasonable risk of injury to human health or the environment.

Dated: June 4, 1992.

John W. Melone,

Director, Chemical Control Division, Office of Pollution Prevention and Toxics.

FEDERAL COMMUNICATIONS COMMISSION

Public Information Collection Requirement Submitted to Office of Management and Budget for Review

The Federal Communications Commission has submitted the following information collection requirement to OMB for review and clearance under the Paperwork Reduction Act of 1980 (44 U.S.C. 3507).

Copies of this submission may be purchased from the Commission's copy

contractor, Downtown Copy Center, 1114 21st Street NW., Washington, DC 20036, (202) 452-1422. For further information on this submission contact Judy Boley, Federal Communications Commission, (202) 632-7513. Persons wishing to comment on this information collection should contact Jonas Neihardt, Office of Management and Budget, room 3235, NEOB, Washington, DC 20503, (202) 395-4814.

OMB Number: 3060-0166.

Title: Part 42-Preservation of Records of Communication Common Carriers. Action: Extension of a currently

approved collection. Respondents: Businesses or other forprofit (including small businesses).

Frequency of Response: Recordkeeping requirement.

Estimated Annual Burden: 68 recordkeepers; 2 hours average burden per recordkeeper; 136 hours total annual burden.

Needs and Uses: Part 42 of the Commission's rules prescribes guidelines to ensure that carriers maintain the necessary records needed by the FCC for its regulatory obligations. Section 42.4 requires carriers to maintain at its operating company headquarters a master index of records which identifies the records retained, the related retention period, and the locations where the records are maintained. Carriers must explain, by adding a certified statement to the index, the premature loss or destruction of records pursuant to section 42.4. Records maintained in a machine readable medium must be accompanied by a statement indicating the type of data included in the record and certifying that the information contained in it has been accurately duplicated pursuant to

section 42.5(b). Section 42.6 requires the retention of telephone toll records for 18 months providing the following billing information about telephone toll calls: The name, address, and telephone number of the caller, telephone number called, date, time and length of the call. Pursuant to section 42.7 carriers are allowed to establish their own retention periods, except for in the case of telephone toll records and records relevant to complaint proceedings. Moreover, this Section specifies requirements for complaint proceedings, and proceedings or inquiries directed by the FCC. Documentation of premature destruction is necessary so the Commission can be aware of the frequency and consequence of such destruction. If carriers were allowed to destroy records at will, the Commission could lose its historical base of information thus making it impossible to properly regulate the industry. A specific retention period for telephone toll records is imposed to assist Department of Justice in law enforcement.

Federal Communications Commission.

Donna R. Searcy,

Secretary. [FR Doc. 92-13915 Filed 6-11-92; 8:45 am] BILLING CODE 8712-01-M

Applications for Consolidated Hearing

1. The Commission has before it the following mutually exclusive applications for renewal of license of Station WUCI-FM, Binghampton, New York, and for a New Noncommercial FM Station at Binghampton, New York:

Applicant, city and state	File No.	MM docket No.
	BRED-910130WF BPED-910501MB BPED-910501MC	92-116

2. Pursuant to section 309(e) of the Communications Act of 1934, as amended, the above applications have been designated for hearing in a consolidated proceeding upon the issues whose headings are set forth below. The text of each issue has been standardized and is set forth in its entirety under the corresponding headings at 51 FR 19347. published May 29, 1988. The letter shown before each applicant's name is

used below to signify whether the issue applies to that particular applicant.

Issue Heading and Applicant

1. (See Appendix), A.

2. Site Availability, B.

3. Environmental Impact, A.B.C.

4. Comparative-Noncommercial

Educational FM, A,B,C.

5. Ultimate, A.B.C.

3. If there is any non standardized issue in this proceeding, the full text of the issue and the applicant(s) to which it applies are set forth in an Appendix to this Notice. A copy of the complete Hearing Designation Order in this proceeding is available for inspection and copying during normal business hours in the FCC Dockets Branch (room 230), 1919 M Street, NW., Washington DC. 20554. The complete text may also be purchased from the Commission's duplicating contractor, International Transcription Services, Inc., 2100 M

Street, NW., Washington, DC, 20037 (Telephone (202) 857–3800). W. Ian Gay,

Assistant Chief, Audio Services Division, Mass Media Bureau.

Appendix

Non standardized issue

1. To determine whether A (Uhuru) has violated 47 CFR 73.1740 and/or 73.1750 and, in light of the evidence adduced, whether Uhuru is qualified to be and remain a licensee of the Commission.

FEDERAL MARITIME COMMISSION

The San Francisco Port Commission et al.; Agreement(s) Filed

The Federal Maritime Commission hereby gives notice of the filing of the following agreement(s) pursuant to section 5 of the Shipping Act of 1984.

Interested parties may inspect and obtain a copy of each agreement at the Washington, DC Office of the Federal Maritime Commission, 1100 L Street, NW., room 10325. Interested parties may submit comments on each agreement to the Secretary, Federal Maritime Commission, Washington, DC 20573, within 10 days after the date of the Federal Register in which this notice appears. The requirements for comments are found in § 572.603 of title 46 of the Code of Federal Regulations. Interested persons should consult this section before communicating with the Commission regarding a pending agreement.

Agreement No.: 224-002813-009. Title: San Francisco Port Commission/Metropolitan California Stevedore Company Nonexclusive Management Agreement.

Parties:

The San Francisco Port Commission ("Port")

Metropolitan California Stevedore Company ("MCSC")

Synopsis: The Agreement provides for: (1) MCSC to be responsible for billing demurrage and wharf storage, and for the port to pay MCSC a fee for the service; (2) the Port to be responsible for dredging, wharf maintenance, crane maintenance and building structural maintenance; (3) the Port to furnish a portable generator to service the increased volume of containers; and (4) all other terms and conditions in the Agreement to remain the same.

Agreement No.: 206.011276-002.
Title: United States/Southern and
East Africa Interconference Agreement.
Parties:

United States/Southern African

Conference United States/East Africa Conference

Synopsis: The proposed amendment modifies the Agreement to allow the parties to discuss and agree upon joint service contracts, time/volulme rates, and time/revenue rates. It also makes other technical changes.

Dated: June 8, 1992.

By order of the Federal Maritime Commission.

Joseph C. Polking,

Secretary.

FEDERAL RESERVE SYSTEM

Cascade Bancor I, Inc., et al.; Formations of; Acquisitions by; and Mergers of Bank Holding Companies

The companies listed in this notice have applied for the Board's approval under section 3 of the Bank Holding Company Act (12 U.S.C. 1842) and § 225.14 of the Board's Regulation Y (12 CFR 225.14) to become a bank holding company or to acquire a bank or bank holding company. The factors that are considered in acting on the applications are set forth in section 3(c) of the Act (12

U.S.C. 1842(c)).

Each application is available for immediate inspection at the Federal Reserve Bank indicated. Once the application has been accepted for processing, it will also be available for inspection at the offices of the Board of Governors. Interested persons may express their views in writing to the Reserve Bank or to the offices of the Board of Governors. Any comment on an application that requests a hearing must include a statement of why a written presentation would not suffice in lieu of a hearing, identifying specifically any questions of fact that are in dispute and summarizing the evidence that would be presented at a hearing.

Unless otherwise noted, comments regarding each of these applications must be received not later than July 6,

1992.

A. Federal Reserve Bank of Chicago (David S. Epstein, Vice President) 230 South LaSalle Street, Chicago, Illinois 60690:

1. Cascade Bancor I, Inc., Cascade, Wisconsin; to become a bank holding company by acquiring 100 percent of the voting shares of Cascade Bancorporation, Inc., Altoona, Iowa, and thereby indirectly acquire State Bank of Cascade, Cascade, Wisconsin.

2. Jones Bancorp, Inc., Marcellus, Michigan; to become a bank holding company by acquiring 100 percent of the voting shares of G.W. Jones Exchange Bank, Marcellus, Michigan.

B. Federal Reserve Bank of Kansas City (John E. Yorke, Senior Vice President) 925 Grand Avenue, Kansas City, Missouri 64198:

1. Healthcare Bancorp, Inc.,
Fayetteville, Arkansas; to become a
bank holding company by acquiring 100
percent of the voting shares of Century
National Bank of Oklahoma, Pryor,
Oklahoma.

Board of Governors of the Federal Reserve System, June 8, 1992.

GENERAL ACCOUNTING OFFICE

Federal Accounting Standards Advisory Board; Meeting

AGENCY: General Accounting Office.

ACTION: Notice of roundtable meeting.

SUMMARY: Pursuant to section 10(a) (2) of the Federal Advisory Committee Act (Pub. L. No. 92–463), as amended, notice is hereby given that the Federal Accounting Standards Advisory Board will sponsor a roundtable discussion on Tuesday, June 30, 1992, from 9 a.m. to noon in room 7313 of the General Accounting Office, 441 G St., NW., Washington, DC.

The purpose of the discussion is to provide Board members with the opportunity of listening to state officials' viewpoints on user needs with respect to federal accounting and financial reporting. Recognizing that many state officials have been active supporters of improvements to federal financial management, including the passage of the Chief Financial Officers Act of 1990, the Board believes it is important to have a forum for an exchange of ideas with state officials as to what are appropriate objectives of accounting and financial reporting for the federal government. Any interested person may attend the discussion as an observer.

FOR FURTHER INFORMATION CONTACT: Ronald S. Young, Staff Director, 401 F St., NW., room 302, Washington, DC 20001, or call (202) 504–3336.

Authority: Federal Advisory Committee Act. Pub. L. No. 92–463, Section 10(a)(2), 86 Stat. 770, 774 (1972) (current version at 5 U.S.C. app. section 10(a)(2) (1988); 41 CFR 101–6.1015 (1990).

Dated: June 8, 1992.

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Agency for Health Care Policy and Research

Meeting

In accordance with section 10(a) of the Federal Advisory Committee Act (5 U.S.C. appendix 2), announcement is made of the following advisory subcommittee scheduled to meet during the month of June 1992:

Name: Grants Information and Tracking System with Contracts Component (GIAnT II): Programming and Implementation Advisory Subcommittee.

Dates and Times: June 12, 1992, 2 p.m. Place: Executive Office Center, 2101 E. Jefferson Street, suite 601, Rockville, Maryland 20852.

This meeting will be closed to the public. Purpose: The Subcommittee's charge is to provide, on behalf of the Health Care Policy and Research Contracts Review Committee, advice and recommendations to the Secretary and to the Administrator, Agency for Health Care Policy and Research (AHCPR) regarding the scientific and technical merit of a contract proposal submitted in response to a specific Request for Proposal. The purpose of this contract is to provide for the software development, programming, implementation and installation of a computerized grant and contract information tracking system.

Agenda: The session of this Subcommittee will be devoted entirely to the technical review and evaluation of a contract proposal submitted in response to a specific Request for Proposal. The Administrator, AHCPR, has made a formal determination that this meeting will not be open to the public. This is necessary to protect the free exchange of views and avoid undue Interference with Committee and Department operations, and safeguard confidential proprietary information and personal information concerning individuals associated with the proposal that may be revealed during the sessions. This is in accordance with section 10(d) of the Federal Advisory Committee Act, 5 U.S.C. appendix 2, Department regulations, 45 CFR 11.5(a) (6), and procurement regulations, 48 CFR 315.604(d).

Anyone wishing to obtain information regarding this meeting should contact Karen Harris, Office of Management, Management Systems and Services Branch, Agency for Health Care Policy and Research, Executive Office Center, 2101 E. Jefferson Street, suite 601, Rockville, Maryland 20652, (301) 227–8441.

Dated: June B, 1992.

Linda K. Demlo,

Acting Administrator, AHCPR.

Centers for Disease Control

[Program Announcement Number 271]

Study of Human Health Consequences of Poly-Brominated Biphenyls (PBB) Contamination in Michigan; Availability of Funds for Fiscal Year 1992

Introduction

The Centers for Disease Control, the Nation's prevention agency, announces the availability of funds in Fiscal Year 1992 to continue a cooperative agreement with the Michigan Department of Public Health to study the human health consequences of exposure to poly-brominated biphenyls (PBB) on farms in Michigan, with particular emphasis on cancer incidence.

The Public Health Service (PHS) is committed to achieving the health promotion and disease prevention objectives of Healthy People 2000, a PHS-led national activity to reduce morbidity and mortality and improve the quality of life. This announcement is related to the priority area of Environmental Health. (For ordering a copy of Healthy People 2000, see the section Where to Obtain Additional Information.)

Authority

This program is authorized under section 301(a) of the Public Health Service Act (42 U.S.C. 241(a)), as amended.

Eligible Applicant

Assistance will be provided only to the Michigan Department of Public Health (MDPH) for this project. No other applications will be solicited.

The MDPH is the most appropriate and qualified agency to provide the services specified under this cooperative agreement because:

1. The MDPH has provided technical and management oversight and has collected data for the study of the PBB exposed cohort (4000 participants) in Michigan since 1976.

2. Funds available for this fiscal year are to be used to resurvey (recharacterize) the same cohort continuously studied for the past 15 years and to develop improved data retrieval procedures for the database. The MDPH is in a unique position to continue the collection of this information given the well established infrastructure already in place from this project.

3. The Michigan PBB project is currently moving from primarily field collection of data to scientific analysis and study of the collected data. To facilitate and effect the best transition, the MDPH is the only source which is able to meet the objectives of this longterm project in the desired time-frame.

Availability of Funds

Approximately \$370,000 will be available in Fiscal Year 1992 to support this project. It is expected the award will begin on July 1, 1992 and will be made for a 12-month budget period with a project period of 1 year.

Purpose

The purpose of this award is to provide funds to accelerate the data collection necessary for the recharacterization of the cohort that is currently underway. This will allow:

- Examination of the cause-specific mortality of the Michigan PBB cohort.
- 2. Examination of the site-specific cancer incidence of the PBB cohort.
- 3. Identification of risk factors for sitespecific cancer outcomes among the PBB cohort
- 4. Examination of agricultural chemical exposures and exposures unique to the Michigan PBB population.
- 5. Comparison of total birth defects to national rates.
- Comparison of reproductive outcomes of the PBB cohort to a control population.
- 7. Continuation of updating and maintenance of the PBB registry at a decreased level, but sufficient to allow research questions to be addressed using the database. Consideration will be given to establishing a surveillance system to collect cancer incidence information on the PBB cohort using methods similar to the Surveillance, Epidemiology, and End Results (SEER) program.

Program Requirements

In conducting activities to achieve the purpose of this program, the recipient shall be responsible for conducting activities under A., below and CDC shall be responsible for conducting activities under B., below:

A. Recipient Activities

- 1. Complete the recharacterization of the PBB cohort by applying a questionnaire compatible with that used at enrollment. This accelerated recharacterization will require the contractual employment of additional field staff.
- Identify and medically confirm reported deaths and cancers as well as hospitalizations, surgeries and diagnoses concerning benign and malignant tumors.
- Continue to identify pregnancies and enroll newborns into the cohort.

- 4. Develop working file packages, index of data files and manual for collaborative research use of the data. This will require the contractual employment of statistical technician services.
- Maintain and update the registry of 4000 participants using proven means to prevent losses to the cohort and identify and account for such losses if they occur.
- 6. Continue computer entry of collected field and laboratory data and assembly of working files for longitudinal characterization.
- Encourage and participate in the development of research proposals utilizing the PBB cohort and its data base.

B. CDC Activities

- 1. Provide technical and scientific consultation and assistance for the developmental and implementation aspects of the PBB cohort recharacterization and improvement of the data retrieval and analysis procedures.
- 2. Provide epidemiology and surveillance training/education materials and on-site assistance on data collection, computer entry, and analysis objectives and procedures.

 Provide guidance on program management and administrative matters related to the conduct of scientific aspects of the cooperative agreement.

 Collaborate in the definition and preparation of reports that will result from the cooperative agreement supported activities.

Evaluation Criteria

The application will be reviewed and evaluated according to the following criteria:

1. Understanding of the problem-35%

The applicant's understanding of the requirements, objectives, research intent, problems, complexities, and interactions required for the conduct of a successful program.

2. Technical Approach-35%

The adequacy of the description and plan to carry out the overall environmental surveillance data collection and research program as specified in the program announcement, including: (a) The specific field data collection activities and schedule of tasks and expected results; (b) the identification of the administrative, computer/data processing services necessary to conduct the program; and (c) the contractual and collaborative arrangements and laboratory services to

be obtained to ensure the completion of program as specified.

3. Program Personnel-30%

The extent to which the proposal has described: (a) The qualifications and commitment of the applicant professional and support staff; and (b) the allocation of time and effort of key program staff to agreed upon program activities.

4. Budget Justification and Adequacy of Facilities—(unscored)

The budget will be evaluated for the extent to which it is reasonable, clearly justified, and consistent with the intended use of cooperative agreement funds.

Other Requirements

Human Subjects

If the proposed project involves research on human subjects, the applicant must comply with the Department of Health and Human Services Regulations (45 CFR 46) regarding the protection of human subjects. Assurance must be provided that demonstrates that the project will be subject to initial and continuing review by an appropriate institutional review committee. The applicant will be responsible for providing such assurance in accordance with appropriate guidelines and form provided in the application kit.

Executive Order 12372 Review

The application is not subject to review under Executive Order 12372.

Catalog of Federal Domestic Assistance Number

The Catalog of Federal Domestic Assistance (CFDA) Number for this program is 93.283.

Application Submission and Deadline

The Michigan Department of Public Health must submit an original and two copies of the application PHS Form 5161–1 to Henry S. Cassell, Ill, Grants Management Officer, Grants Management Branch, Procurement and Grants Office, Centers for Disease Control, 255 East Paces Ferry Road, NE., room 300, Atlanta Georgia 30305, on or before June 14, 1992.

Where to Obtain Additional Information

If you are interested in obtaining additional information regarding this project, please refer to Announcement Number 271 and contact Lisa Tamaroff, Grants Management Specialist, Grants Management Branch, Procurement and Grants Office, Centers for Disease Control, 255 East Paces Ferry Road, NE.,

Mail Stop E-14, Atlanta, Georgia, 30305, (404) 842-6630. Programmatic technical assistance may be obtained from Lawrence E. Posey, Health Studies Branch, Division of Environmental Health, National Center for Environmental Health and Injury Control, Centers for Disease Control, 1600 Clifton Road, NE., Atlanta, Georgia 30333, (404) 488-4682.

A copy of Healthy People 2000 (Full Report, Stock No. 017–001–00474–0) or Healthy People 2000 (Summary Report, Stock No. 017–001–00473–1) referenced in the Introduction may be obtained through the Superintendent of Documents, Government Printing Office, Washington, DC 20402–9325 (Telephone (202) 783–3238).

Dated: June 8, 1992.

Robert L. Foster.

Acting Associate Director for Management and Operations, Centers for Disease Control. [FR Doc. 92–13834 Filed 6–11–92; 8:45 am] BILLING CODE 4160–18–M

Food and Drug Administration

[Docket No. 92E-0144]

Determination of Regulatory Review Period for Purposes of Patent Extension; Ismo(R)

AGENCY: Food and Drug Administration,

ACTION: Notice.

SUMMARY: The Food and Drug
Administration (FDA) has determined
the regulatory review period for Ismo®
and is publishing this notice of that
determination as required by law. FDA
has made the determination because of
the submission of an application to the
Commissioner of Patents and
Trademarks, Department of Commerce,
for the extension of a patent which
claims that human drug product.

ADDRESSES: Written comments and petitions should be directed to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1–23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Joel P. Sparks, Office of Health Affairs (HFY-20), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301-443-1382.

SUPPLEMENTARY INFORMATION: The Drug Price Competition and Patent Term Restoration Act of 1984 (Pub. L. 98–417) and the Generic Animal Drug and Patent Term Restoration Act (Pub. L. 100–670) generally provide that a patent may be extended for a period of up to 5 years so

long as the patented item (human drug product, animal drug product, medical device, food additive, or color additive) was subject to regulatory review by FDA before the item was marketed. Under these acts, a product's regulatory review period forms the basis for determining the amount of extension an applicant may receive.

A regulatory review period consists of two periods of time: a testing phase and an approval phase. For human drug products, the testing phase begins when the exemption to permit the clinical investigations of the drug becomes effective and runs until the approval phase begins. The approval phase starts with the initial submission of an application to market the human drug product and continues until FDA grants permission to market the drug product. Although only a portion of a regulatory review period may count toward the actual amount of extension that the Commissioner of Patents and Trademarks may award (for example, half the testing phase must be subtracted as well as any time that may have occurred before the patent was issued), FDA's determination of the length of a regulatory review period for a human drug product will include all of the testing phase and approval phase as specified in 35 U.S.C. 158(g)(1)(B).

FDA recently approved for marketing the human drug product Ismo(R). Ismo(R) (isosorbide mononitrate) is indicated for the prevention and control of stable angina pectoris. Subsequent to this approval, the Patent and Trademark Office received a patent term restoration application for Ismo® (U.S. Patent No. 4,431,829) from Boerhinger Mannheim, and the Patent and Trademark Office requested FDA's assistance in determining this patent's eligibility for patent term restoration. FDA, in a letter dated April 29, 1992, advised the Patent and Trademark Office that this human drug product had undergone a regulatory review period and that the approval of Ismo® represented the first commercial marketing of the product. Shortly thereafter, the Patent and Trademark Office requested that FDA determine the product's regulatory review period.

FDA has determined that the applicable regulatory review period for Ismo® is 2,878 days. Of this time, 1,157 days occurred during the testing phase of the regulatory review period, while 1,721 days occurred during the approval phase. These periods of time were derived from the following dates:

1. The date an exemption under section 505(i) of the Federal Food, Drug,

and Cosmetic Act became effective:
February 12, 1984. The applicant claims
February 7, 1984, as the date the
investigational new drug application
(IND) became effective. However, FDA
records indicate that the IND effective
date was February 12, 1984, which was
30 days after FDA receipt of the IND.

- 2. The date the application was initially submitted with respect to the human drug product under section 505(b) of the Federal Food, Drug, and Cosmetic Act: April 14, 1987. FDA has verified the applicant's claim that the new drug application (NDA) for Ismo® (NDA 19–091) was submitted on April 14, 1987.
- 3. The date the application was approved: December 30, 1991. FDA has verified the applicant's claim that NDA 19-091 was approved on December 30, 1991.

This determination of the regulatory review period establishes the maximum potential length of a patent extension. However, the U.S. Patent and Trademark Office applies several statutory limitations in its calculations of the actual period for patent extension. In its application for patent extension, this applicant seeks 2 years of patent term extension.

Anyone with knowledge that any of the dates as published is incorrect may, on or before August 11, 1992, submit to the Dockets Management Branch (address above) written comments and ask for a redetermination. Furthermore, any interested person may petition FDA, on or before December 9, 1992, for a determination regarding whether the applicant for extension acted with due diligence during the regulatory review period. To meet its burden, the petition must contain sufficient facts to merit an FDA investigation. (See H. Rept. 857, Part 1, 98th Cong., 2d sess., pp. 41-42, 1984.) Petitions should be in the format specified in 21 CFR 10.30.

Comments and petitions should be submitted to the Dockets Management Branch (address above) in three copies (except that individuals may submit single copies) and identified with the docket number found in brackets in the heading of this document. Comments and petitions may be seen in the Dockets Management Branch between 9 a.m. and 4 p.m., Monday through Friday.

Dated: June 5, 1992.

Stuart L. Nightingale,

Associate Commissioner for Health Affairs. [FR Doc. 92-13844 Filed 8-11-92; 8:45 am]
BILLING CODE 4160-01-F

Health Care Financing Administration

Public Information Collection Requirements Submitted to the Office of Management and Budget for Clearance

AGENCY: Health Care Financing Administration, HHS. The Health Care Financing Administration (HCFA). Department of Health and Human Services, has submitted to the Office of Management and Budget (OMB) the following proposal for the collection of information in compliance with the Paperwork Reduction Act (Pub. L. 98-511). The HCFA has requested expedited review by OMB. In keeping with the requirements for expedited reviews, we are including a copy of the forms and instructions. Comments may be sent to OMB at the address below for seven (7) days after the date of this

Type of Request: Revision; Title of Information Collection: Clinical Laboratory Improvement Amendments (CLIA) Application Forms; Form Numbers: HCFA-114 and 116; Use: The CLIA of 1988 require the Department of Health and Human Services (HHS) to establish certification requirements for any laboratory that performs tests on human specimens and to certify through the issuance of a certificate that those laboratories meet the established requirements. These forms, which replace Forms HCFA-109 and 3083, will be completed by entities performing laboratory testing on human specimens for health purposes and will initiate the certification process. Frequency: Biennially; Respondents: State/local governments, businesses/other for profit, Federal agencies/employees, nonprofit institutions, and small businesses or organizations; Estimated Number of Responses: 100,000; Average Hours per Response: 5.5; Total Estimated Burden Hours: 550,000. Additional Information or Comments: Written comments and recommendations for the proposed information collections should be sent directly to the following address: OMB Reports Management Branch, Attention: Allison Eydt, New Executive Office Building Room 3208, Washington, DC

Date: June 2, 1992.

William Toby, Jr.,

Acting Administrator, Health Care Financing Administration.

Supporting Statement for the CLIA Application Forms, HCFA-114 and HCFA-116

A. Background

The Clinical Laboratory Improvement Amendments of 1988 (CLIA), Public Law 100-578, was enacted on October 31, 1988. CLIA established a new section 353 of the Public Health Service Act to replace the existing section 353. The new section 353 requires the Department of Health and Human Services (HHS) to establish certification requirements for any laboratory that performs tests on human specimens, and to certify through the issuance of a certificate that those laboratories meet the requirements established by HHS. Also, the legislation contains certificate requirements and specifies circumstances that permit certificates of waiver to be issued. The law also includes requirements for approval of accreditation bodies and State licensure bodies, sanctions, judicial review, fees and disclosure of information to the public.

Section 6141 of the Omnibus Budget Reconciliation Act of 1989 (OBRA'89), Public Law 101–239, requires that laboratories participating in the Medicare program comply with CLIA requirements. Subject to specified exceptions, laboratories must have a current unrevoked and unsuspended certificate to be eligible for reimbursement in the Medicare or Medicaid programs or both.

Final CLIA regulations (with comment) were published in the Federal Register on February 28, 1992. While actual compliance surveys of laboratories will not begin until September of 1992, the process of issuing certificates will begin in the next few months. Entities that completed a HCFA 109, "Information to Implement CLIA'88," (this questionnaire was initially mailed in November 1991 in order to develop a data base of entities subject to CLIA) will be mailed a coupon for CLIA fee remittance. If the laboratory only conducts tests that are on the waived list it will be issued a certificate of waiver upon payment of the fee of \$100. If the laboratory conducts any tests that are not waived, it must obtain a registration certificate. Upon payment of the appropriate fee (which is dependent on testing specialties and annual testing volume) these laboratories will be issued a registration certificate. Certificates are valid for up to 2 years.

Laboratories issued a certificate of

waiver will not be subject to biennial surveys to determine compliance with CLIA requirements. Laboratories issued a registration certificate must obtain a regular certificate or certificate of accreditation (once accrediation programs are approved). These certificates will be issued based on a survey to determine compliance. Such surveys will be conducted by HCFA (or its agents) or the approved accreditation program. Costs for the surveys conducted by HCFA must be paid prior to the survey and are based on a specific fee schedule related to the number of testing specialties and volume of testing conducted.

The attached application forms will be mailed to laboratories issued registration certificates and to entities requesting to be regulated by HCFA who did not complete a HCFA-109. Information obtained on the application is needed to determine the applicable fee schedule, to assign appropriate user fees and to update information essential to the survey process. These application forms will also replace and consolidate the HCFA-109 as well as other HCFA forms that are used in the current survey process (e.g., HCFA-3083, Laboratory Personnel Qualification Appraisal).

HCFA is requesting the Office of Management and Budget (OMB) review and approval of the HCFA-114 and HCFA-116 application forms that laboratories will be required to complete in order to obtain CLIA certificates.

B. Justification

1. Need and Legal Basis

Legislative authority for this activity is found in section 353 of the Public Health Service Act. Section 353(b) specifies that the laboratory must submit an application in such form and manner as the Secretary shall prescribe that describes the characteristics of the laboratory and examinations and other procedures performed by the laboratory including—

—The number and types of laboratory and examinations and other procedures performed;

 The methodologies for the laboratory examinations and other procedures employed;

—The qualifications (educational background, training, and experience) of the personnel directing and supervising the laboratory and performing the laboratory examinations and other procedures; and

—Such other information as the Secretary may require to determine compliance with this section.

The application will consist of three separate forms (HCFA-116, "General Laboratory Information;" HCFA 114, "Personnel Information," copies attached; and the HCFA-115, "Testing Information," which will be developed (and separately submitted for OMB approval) once initial test categorization is completed by the Centers for Disease Control (CDC). We are planning in conjunction with CDC and the Food and Drug Administration, to develop a standard coding system for the tests. The format to collect this information will be developed once the initial categorization of tests/methodologies is completed by the CDC.

The approach of using separate forms to collect application information was used in the application process under CLIA'67 and worked well. It will enable us to revise or update information on one form without having to re-clear and reprint all three. The forms have been designed to address the statutory and regulatory requirements of the application process.

Information requested on these forms is essential for administering the CLIA program, including responding to inquiries regarding certification status and information regarding the size and scope of laboratory operations across the country and conducting the Congressionally mandated studies. Obtaining certain informatioin (i.e., locations of multiple sites, hours of operation and personnel qualifications) on the application forms wil also allow for the use of fewer resources and a more efficient method of preparing. scheduling and conducting surveys to assess compliance.

Following is a detailed justification for informtion requested on each form:

HCFA-116 Clinical laboratory information. This form captures basic identifying information of the laboratory and its operation. If the laboratory has completed a HCFA-109 and paid the applicable user fee, we intend to have certain information (laboratory name, address, etc.) pre-printed on the form or a pre-printed re-usable label, if the cost to do this is not prohibitive.

The information collected on this form will enable us to determine the appropriate certificate and compliance fees based on volume and scope of testing, schedule and conduct surveys in a timely and cost efficient manner and provide an easily accessible database of clinical laboratory identification data.

HCFA-114 Laboratory personnel report. Completion of this form will be

dependent on the level of testing performed. The statue requires that all laboratories, even those performing only waived tests, provide information concerning the qualifications (educational background, training and experience) of individuals involved in

laboratory testing. Since the qualifications for personnel are related to the complexity of the testing performed in the laboratory, the form has been designed to accommodate complexity of testing. For all personnel areas, with the exception of laboratory director, information collected on this form will be limited in the numbers of individual functioning in the various laboratory positions (for example, technical supervisor, clinical consultant, etc.). The laboratory must list the name of the laboratory director and may voluntarily provide the Social Security number. The informtion gathered for personnel also reflects levels of education, training and experience. The classifications correlate with the regulatory requirements and are structured so that the applicant can complete the form without having to continuously refer to the regulations.

This format for collecting personnel information will eliminate the massive paper flow that currently exists. In the existing certification process the laboratory submits resumes, and/or the existing personnel qualification form (HCFA-3083) for each individual functioning in the laboratory. The HCFA-3083 will no longer be used in the

CLIA survey process.
The HCFA-3083 was estimated to take .33 hour to complete for each individual. This form was completed only once by laboratory personnel, unless the individual wished to qualify for a different or higher position. In that case, the individual only completed the portion for the HCFA-3083 related to the new position. Failure to furnish the requested information could result in the facility not being certified or recertified for Medicare participation. Since interstate and interregional movement of laboratory personnel was common, the State Survey Agencies could exchange HCFA-3083 information so that personnel need not refile a HCFA-3083 when they moved to new areas. This information was not maintained in a computer database.

If we assume that this information is available on all personnel for the currently regulated laboratories and only newly regulated entities must complete this form for individuals in the laboratory it still is an overwhelming burden. Using the time estimate for completion of the current HCFA-3083, the low assumption for physician office

laboratories (POLs) from the Regulatory Impact Analysis and, assuming that 2 individuals in each POL are involved in laboratory testing, the additional burden would be as follows:

110,000 POLs×2 individuals×.33 hrs.=72,600 hrs for completion of HCFA3083

The format we propose would eliminate the HCFA-3083, minimize the information collection burden, and eliminate the excessive paper flow. while fulfilling the requirements of the law and inspector needs. This format will also facilitate availability of data for program evaluation purposes (i.e., conducting surveys, responding to Congressional and professional inquiries, etc.). It will also provide statistical information necessary for conducting the CLIA studies mandated by Congress on the correlation between personnel and accuracy and reliability of results of testing performed by the laboratory. The information from this application is vital to responding to such requests and required data needs. During the survey the surveyor will randomly select personnel files to verify the accuracy of the personnel information submitted. The information on the application is also validate by the signature of the director.

2. Information Users

The information collected will be used by HCFA to identify entities performing laboratory testing and to issue the appropriate certificates so that the entities comply with CLIA and appropriate fees are paid in a timely manner.

This information will also be part of the database used by carriers, intermediaries and the Medicaid program to ensure appropriate Medicare/Medicaid payment.

3. Improved Information Technology

This information collection does not lend itself to electronic transmission.

4. Duplication

These application forms do not duplicate any information currently collected. They contain information required by the statute and regulations and are essential to efficient operation of the program.

5. Similar Information

These application forms are the only standardized mechanism available to record data on entities applying for CLIA certification. The HCFA-109 contains a few of the same data elements but was developed as a questionnaire prior to publication of the final regulation. This form does not

reflect any requirements of the regulation, particularly as they relate to personnel and multiple sites of laboratories. The HCFA-109 will no longer be used once these application forms are approved and printed. In addition, existing forms used by laboratories for obtaining Medicare/interstate approval (HCFA-3083) will also become obsolete.

6. Small Business

These application forms will have an impact on small businesses that operate as laboratories which are regulated under CLIA. These forms have been designed to collect only the information necessary to meet and implement the CLIA statute and regulations. We have attempted to minimize the burden as much as possible.

7. Less Frequent Collection

These forms will be completed by all entities subject to CLIA. Those entities that completed a HCFA-109 and only do waived tests will not be requested to complete these forms until it is time to renew their certificates. Laboratories performing non-waived tests will be required to complete these forms, as well as any entity that did not complete a HCFA-109 prior to approval of these certification forms.

8. General Collection Guidelines

This information collection complies with all general guidelines in 5 CFR 1320.6.

9. Outside Consultation

We did not seek outside consultation on these forms since the information is necessary to meet the statutory and regulatory requirements of CLIA. We have attempted to design the forms to minimize the burden on the entity while at the same time obtaining information that is essential to the certification process.

10. Condfidentiality

We do not pledge confidentiality.

11. Sensitive Questions

There are no questions of sensitive nature associated with these forms.

12. Cost Estimates

Cost estimates are based on printing 210,000 sets of forms, with 200,000 being used as the basis for estimating costs and burden. While we realize the Regulatory Impact Analysis estimations ranged from a low of 180,000 laboratories subject CLIA to a high of 250,000, we have made this prudent

estimation based on the following factors:

-We do not know the number of entities that may decide to cease testing:

We do not know how many laboratories will qualify for one certificate for multiple locations;

We do not know the number of laboratories who have completed a HCFA-109 and require only a certificate of waiver:

This number should meet the immediate need based on the response to the HCFA-109 mailing and allow for a supply to be sent to all regional offices and State agencies for distribution to laboratories who did not complete a HCFA-109; and

-We may need to modify the form prior to the expiration of OMB approval based on our early experience during the initial implementation of CLIA.

If we find that we have underestimated the universe we will modify the burden statement and reprint the forms.

Federal. Congress provided the Secretary with the authority to establish a user fee system in order that the entire cost of administering the CLIA program be borne by the laboratories, thus making the CLIA program self-

supporting.

The following costs are associated with this information collection. These funds will be advanced from the administrative budget and will be reimbursed once fees are collected. As explained above, we are basing our costs on a printing of 210,000 sets of forms. Laboratoreis performing only waived tests will not initially need to complete this information if they completed a HCFA-109 and are in our data base. Utilizing the intermediate projections in the regulatory Impact

Analysis of HSQ-176-FC, we estimated that approximately 10,000 laoratories will meet the waived criteria, with 200,000 that will need to initially complete these application forms.

(HCFA 114-7 pages: HCFA 116-4 pages)

Printing	\$ 50,000
Mailing	130,000
Date Entry	750,000
Total Federal Cost	*\$930,000

' Since the CLIA certificate is valid for 2 years, actual annual cost is one-half this amount [\$465,000].

Respondent. The cost to each respondent for completion of the application forms has been calculated at the standard rate of \$10 per hour. As previously indicated, laboratories performing only waived tests will not need to complete this information if they completed a HCFA-109 and are in our data base. Utilizing the intermediate projections in the Regulatory Impact Analysis of HSQ-176-FC, we estimate that approximately 10,000 laboratories will meet the waived criteria, thus 200,000 will need to initally complete these application forms.

Based on the estimates in item 13 we have calculated the respondent cost estimates as follows:

HCFA-114 4.25 hour/laboratory × 200,000=\$8,500,000 HCFA-116 1.25 hour/laboratory $\times 200,000 = 2,500,000$ Total Respondent Cost \$11,000,000*

*Since the CLIA certificate is valid for 2 years, actual annual cost is one-half this amount (\$5,500,000).

13. Estimate of Burden

These forms contain information necessary to implement and maintain the CLIA program. The application forms are completed by entities which provide laboratory services as defined under CLIA.

The information contained on the HCFA-114 is information concerning the education, training, and experience of the laboratory director and personnel of the laboratory. This is based on the regulatory requirements. We anticipate it will take between 30 minutes to 8 hours to complete depending on the size of the laboratory.

The information contained on the HCFA-116 is basic information concerning the operation of the laboratory that is needed to assess the appropriate user fee and if applicable, conduct the survey. We anticipate it will take between thirty minutes to two hours to complete depending on the size of the laboratory.

Burden Computation:

HCFA-114-4.25 (average time) × 200,000 = 850,000 hours HCFA-116-1.25 (average time) X 200,000 = 250,000 hours Total Burden 1,100,000 hours*

Since the CLIA certificate is valid for 2 years, actual annual burden is one-half this amount. (550,000 hours)

14. Changes in Burden

This is a new collection of information required by CLIA. Forms previously used by laboratories for Medicare or interstate approval will no longer be used. In addition, Form HCFA-109 which was used to obtain preliminary information from CLJA laboratories will no longer be used upon approval of these forms.

15. Publication and Tabulation Dates

Not applicable.

BILLING CODE 4120-03-M

(A PARTMENT OF HEALTH AND HUMAN SERVICES

FORM APPROVED OMB NO 0938-

LABORATORY PERSONNEL REPORT

CLINICAL LABORATORY IMPROVEMENT AMENDMENTS OF 1988

Public reporting burden for this collection of information is estimated at average 30 minutes to 8 hours per response, including time for reviewing instructions, searching existing data sources, gathering and maintaining data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing the burden, to HCFA, Office of Financial Management, P.O. Box 26684, Baltimore, MD 21207; and to the Office of Management and Budget, Paperwork Reduction Project (OMB 0938-XXXX), Washington, D.C. 20503.

LABORATORY NAME CLIA IDENTIFICATION NUMBER LABORATORY ADDRESS (NUMBER AND STREET) CITY STATE ZIP CODE

PLEASE NOTE: The authority for the solicitation of the requested information is Section 353 of the Public Health Service Act (42 U.S.C. 263a). The principal purpose for collecting the names and Social Security numbers (SSN) of persons directing laboratory testing is to assure that requirements of CLIA are met. Your SSN is helpful for identification, but you are not required to indicate it if you do not desire to do so. HCFA will not be maintaining this information in a system of records.

WAIVED TESTING

Laboratories performing only waived tests do not have to meet CLIA personnel requirements, but must identify and submit to the Secretary information on individuals directing, supervising and performing laboratory testing as required by 353 (d)(2)(A)(i) of the PHSA.

If you perform ONLY walved tests, complete this page only. (If you perform walved and nonwalved tests or only nonwaived tests, do not complete this page.)

DIRECTOR

Instructions for completion: List the name, SSN and the appropriate codes (listed below) for education and laboratory training/experience for the primary director (i.e., individual responsible for overall performance of laboratory testing).

CODE	EDUCATION(ED)
01	MD/DO
02	PhD
03	MS/MA
04	BS/BA
05	Other (specify)

CODE	TRAINING/EXPERIENCE (T/E)
01	0-1 yr
02	1-2 yrs
03	2-4 yrs
04	Over 4 yrs

DIRECTOR'S NAME	Fig. 10		
- COLOTO HAME	SSN	ED CODE	T/E CODE

DIRECTOR QUALIFICATIONS - MODERATE AND HIGH COMPLEXITY TESTING

NOTE: A LABORATORY THAT PERFORMS BOTH MODERATE AND HIGH COMPLEXITY TESTING MUST HAVE A DIRECTOR WHO MEETS THE QUALIFICATIONS FOR HIGH COMPLEXITY TESTING.

Instructions: Listed below are the requirements that individuals serving as directors of laboratories performing moderate or high complexity testing must meet. Specific codes have been assigned to each possible way a director may meet the qualifications specified in the regulation. Please indicate the name, Social Security number and applicable code from the list below for the primary director of the laboratory. Select the highest applicable qualification code that relates to the highest level of testing performed in your laboratory. Only one individual may be listed as director. Note: The laboratory director must possess a current license as a laboratory director issued by the State in which the laboratory is located, if such licensing is required.

Example: An individual with a PhD in chemistry directs a laboratory performing only moderate testing. This individual has been serving as a director for 2 years. After completing the name and Social Security number, the appropriate qualification code to use would be MO3.2.

Health Resources and Services Administration

Grants To Modify State Trauma Care Plans

AGENCY: Health Resources and Services
Administration, HHS.

ACTION: Notice of availability of grant funds.

SUMMARY: The Health Resources and Services Administration announces that up to \$4 million is available in fiscal year 1992 for grants for assistance to States to develop, implement, and monitor modifications of the trauma care component of the State plan for the provision of emergency medical services. These grants are authorized by sections 1211 and 1232(c) of the Public Health Service Act, as amended. Funds are appropriated under Public Law 102–170.

DATES: To receive consideration, grant applications must be received by the close of business August 3, 1992. Applications will meet the deadline if they are either (1) received on or before the deadline date; or (2) postmarked on or before the deadline date and received in time for submission to the review committee. A legibly dated receipt from a commercial carrier or U.S. Postal Service will be accepted in lieu of a postmark. Private metered postmarks will not be accepted as proof of timely mailing. Hand delivered applications must be received by 5 pm August 3, 1992. Applications received after the deadline will be returned to the applicant.

FOR FURTHER INFORMATION CONTACT: Additional information relating to technical or program issues may be obtained from Mrs. Diane McMenamin, Trauma Implementation Activities. Bureau of Health Resources Development, Parklawn Building, room 11A-22, 5600 Fishers Lane, Rockville, Maryland 20857, 301-443-7577. Grant applications and additional information regarding business, administrative, or fiscal issues related to the awarding of grants under this Notice may be requested from the Grants Management Officer (GMO), Ms. Glenna Wilcom, Parklawn Building, room 13A-38, 5600 Fishers Lane, Rockville, Maryland 20857, 301-443-2280. Applicants for grants will use Form PHS 5161-1, approved under OMB Control Number 0937-0189. Completed applications should be sent to the GMO.

SUPPLEMENTARY INFORMATION:

Background and Objective

This program provides grant funds for States to develop, implement, and monitor modifications to the trauma care component of the State plan for the provision of emergency medical services (EMS).

The Public Health Service urges applicants to submit work plans that address specific objectives of Healthy People 2000. Potential applicants may obtain a copy of Healthy People 2000 (Full Report: Stock No. 017–001–00474–0) or Healthy People 2000 (Summary Report: Stock No. 017–001–00473–1) through the Superintendent of Documents, Government Printing Office, Washington, DC 20402–9325, 202–783–3238.

Purpose and Specifications of Grant Program

The principal purpose of this grant program is to ensure access to the highest possible quality of trauma care through modifications to the trauma care component of the plan. To accomplish this objective, grants will be awarded consistent with the statute as specified in this notice. As specified in the legislation, modifications should ensure that the plan:

1. Specifies that the modifications required by this legislation will be implemented by the principal State agency for EMS or the designee of such

2. Specifies any public or private entity that will designate trauma care regions and trauma centers in the State;

3. Contains standards and requirements for the designation of level I, II and III trauma centers, including standards and requirements for:

 The number and types of trauma patients the center must serve to ensure sufficient experience and expertise to be able to provide quality care;

Resources and equipment needed;
 and

Availability of rehabilitation services;

4. Contains standards and requirements for regional trauma care systems, including standards and guidelines (consistent with the provisions of section 1867 of the Social Security Act for medically directed triage and transportation of trauma patients) prior to care in designated trauma centers:

5. Contains standards and requirements for medically directed triage and transport of severely injured children to designated trauma centers with specified capabilities in the care of the pediatric trauma patient;

Specifies procedures for the evaluation of designated trauma centers and trauma care systems;

7. Provides for the establishment and collection of data from each designated

trauma center in the State to a central data reporting and analysis system:

 To identify number of severely injured trauma patients within regional trauma care systems;

 To identify the cause of injury and any factors contributing to the injury;

 To identify the nature and severity finiury:

 To monitor trauma patient care, including prehospital, in each designated trauma center for purposes of evaluating the diagnosis, treatment, and treatment outcome;

 To identify uncompensated trauma care expenditures for each year by each designated trauma center;

 To identify petients transferred within a regional trauma system, including reasons for transfer;

8. Provides for the use of procedures by paramedics and EMS technicians to assess severity of injury:

9. Provides appropriate transportation and transfer policies to ensure the delivery of patients to designated trauma centers and other facilities within and outside of the jurisdiction, including policies to ensure that only individuals appropriately identified as trauma patients are transferred to designated trauma centers, and provides periodic reviews of the transfers and the auditing of such transfers that are determined to be appropriate;

10. Conducts public education activities concerning injury prevention and obtaining access to trauma care;

 Provides for coordination between States with common standard metropolitan statistical areas.

Funds Available

Up to \$4 million is available for this program. Grants will be awarded competitively. There will be approximately 20–26 grants awarded at an average amount of \$150,000 to \$175,000. The maximum size of an award will be limited to \$250,000. The grant period will be 12 months from the date of award.

Eligible Applicants

Eligible applicants are the 50 States, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, and the Commonwealth of the Northern Mariana Islands.

Technical Assistance

The Health Resources and Services Administration (HRSA) intends to sponsor several technical assistance sessions on the intent and format of the grant application. Because of limited State funds for travel to a workshop, the HRSA will conduct several telephone conference calls with approximately 10 potential State applicants assigned to each call. These calls will be conducted after application packages have been mailed and States have had an opportunity to review the official Application Guidance. To obtain instructions and sign up for one of these technicalassistance conference calls, applicants should contact Mrs. Doreen Brandes on (301) 443–7577.

Application Evaluation Criteria

Grant applications will be evaluated by an objective review committee according to the following criteria:

- Adequacy of the description of the gap in EMS/trauma system components and of data presented in the needs assessment to support that the applicant is among those States that have the greatest need to develop, implement, and monitor trauma care systems;
- Adequacy of documentation to support that the applicant is among those States that demonstrate the greatest commitment to establishing and maintaining such systems;
- 3. Completeness of the current State EMS plan and of anticipated modifications to ensure adequate availability of complementary components necessary to support the trauma care plan;
- 4. Adequacy of the rationale that the modifications proposed for development, implementation, or monitoring follow a rational sequence of EMS and trauma care planning activities, support the commitment to a continuum of care, and will improve the quality of trauma care provided;
- Appropriateness and adequacy of the work plan, methodologies, and schedule for organizing and completing the project within the 1-year timeframe;
- 6. Preparation of application and proposed activities and workplan demonstrate coordination and consultation with, and commitment of, the medical, surgical, and nursing specialty groups, hospital associations, State and local EMS directors, concerned advocates and other interested parties;
- Reasonableness of the proposed budget and the cost efficiency of the project relative to service vs. administrative costs; and
- 8. Proposal demonstrates an understanding of the problems in the State associated with developing, implementing, and monitoring a trauma care system and proposes effective measures to minimize these problems.

Allowable Costs

The basis for determining the allowability and allocability of costs charged to PHS grants is set forth in 45 CFR part 74, subpart Q and 45 CFR 92.22 for State and local governments.

Other Award Information

A successful applicant under this notice will submit reports in accordance with the provisions of the general regulations which apply under 45 CFR part 74, subpart J, and 45 CFR 92.40 for State and local governments. Interim progress reports and a final report will be required of grantees.

Executive Order 12372

This grant program to modify the trauma care component of the State plan for EMS has been determined to be a program which is not subject to the provisions of Executive Order 12372 concerning intergovernmental review of Federal programs.

The OMB Catalog of Federal Domestic Assistance Number for this program is 93.953.

Dated: May 8, 1992.

John H. Kelso.

Grants To Improve Emergency Medical Services and Trauma Care in Rural Areas

AGENCY: Health Resources and Services Administration, HHS.

ACTION: Notice of availability of grant funds.

SUMMARY: The Health Resources and Services Administration announces that up to \$500,000 is available in fiscal year 1992 for grants to public and private nonprofit entities for the purpose of carrying out research and demonstration projects with respect to improving the availability and quality of emergency medical services and trauma care in rural areas. These grants are authorized by section 1204 of the Public Health Service Act, as amended. Funds are appropriated under Public Law 102-170. DATES: To receive consideration, grant applications must be received by the close of business August 10, 1992. Applications will meet the deadline if they are either: (1) Received on or before the deadline date; or (2) postmarked on or before the deadline date and received in time for submission to the review committee. A legibly dated receipt from a commercial carrier or U.S. Postal Service will be accepted in lieu of a postmark. Private metered postmarks

will not be accepted as proof of timely mailing. Hand delivered applications must be received by 5 p.m. August 10, 1992. Applications received after the deadline will be returned to the applicant.

FOR FURTHER INFORMATION CONTACT: Additional information relating to technical or program issues may be obtained from Mrs. Diane McMenamin, **Bureau of Health Resources** Development, Parklawn Building, room 11A-22, 5600 Fishers Lane, Rockville, Maryland 20857, 301-443-7577. Grant applications and additional information regarding business, administrative, or fiscal issues related to the awarding of grants under this Notice may be requested from the Grants Management Officer (GMO), Ms. Glenna Wilcom, Parklawn Building, room 13A-38, 5600 Fishers Lane, Rockville, Maryland 20857. 301-443-2280. Applicants for grants will use Form PHS 5161-1, approved under OMB Control Number 0937-0189.

SUPPLEMENTARY INFORMATION:

Background and Objectives

to the GMO.

The program to Improve Trauma Care in Rural Areas provides assistance to public and private nonprofit organizations for the purpose of carrying out research and demonstration projects to improve the availability and quality of emergency medical services (EMS) and trauma care in rural areas by:

Completed applications should be sent

- Developing innovative uses of communications technologies and the use of new communications technology;
- 2. Developing model curricula for training EMS personnel, including first responders, emergency medical technicians, emergency nurses and physicians, and paramedics—
- a. In the assessment, stabilization, treatment, preparation for transport, and resuscitation of seriously injured patients, with special attention to problems that arise during long transports and to methods of minimizing delays in transport to the appropriate facility; and
- b. In the management of the operation of the EMS system;
- 3. Making training for original certification, and continuing education, in the provision and management of EMS more accessible to emergency medical personnel in rural areas through telecommunications, home studies, providing teachers and training at locations accessible to such personnel, and other methods;
- 4. Developing innovative protocols and agreements to increase access to

prehospital care and equipment necessary for the transportation of seriously injured patients to the appropriate facilities; and

5. Evaluating the effectiveness of protocols with respect to EMS and

systems.

The Public Health Service urges applicants to submit workplans that address specific objectives of Healthy People 2000. Potential applicants may obtain a copy of Healthy People 2000 (Full Report: Stock No. 017-001-00474-0) or Healthy People 2000 (Summary Report: Stock No. 017-001-00473-1) through the Superintendent of Documents, Government Printing Office, Washington, DC 20402-9325, 202-783-3238.

Program Priorities

In making grants, special consideration will be given to an applicant that will provide services under this program in any rural area identified by a State for which:

1. There is no system of access to EMS through the telephone number 911;

2. There is no basic life-support system; or

3. There is no advanced life-support

system.

Special consideration means that approved applications providing services in such rural areas will be funded before approved applications providing services in other rural areas. In order to receive special consideration under this legislative provision, it is the responsibility of the applicant to include with the application a certification by the State EMS Office that the proposed services or study of such services will be provided in rural areas identified as meeting one or more of the three factors listed above. The definition of basic or advanced life-support systems will be determined by the State and must be consistent with the definition generally recognized and used by the State.

Availability of Funds

Up to \$500,000 is available for this program. Approximately 2–5 grants will be funded ranging from \$100,000 to \$250,000. The grant period will be 12 months from the date of award.

Eligible Applicants

Any public or private nonprofit entity whose application has as its primary objective improving the availability and quality of EMS in rural areas may apply. The applicant entity is not required to reside in a rural area. The applicant must, however, provide services and otherwise perform a research and demonstration activity in a rural area(s).

In order to meet the rural requirement, an area must be located outside a Metropolitan Statistical Area (MSA) as defined by the Office of Management and Budget. A list of the cities and counties that are designated as being within a MSA will be included with the application. Thus, if the city or county name does not appear on this list, the area would meet the definition of rural as used in this program.

Application Evaluation Criteria

Grant applications will be evaluated by an objective review committee according to the following:

1. Applicant's demonstrated experience and qualifications to complete the project proposed and to function as the lead agency in performing research and demonstration projects related to improving availability and quality of EMS in rural areas;

 Adequacy of documentation in support of the need and justification for the research and demonstration project, including innovative and creative

proposals:

3. Appropriateness and adequacy of the work plan, methodologies, and schedule for organizing and completing the project within the 1 year timeframe, including adequate commitment and participation of the affected rural area if applicant is not located in a rural area;

 Extent to which the proposed project would be capable of replication in other rural areas with similar needs and characteristics, including cost-

effectiveness;

5. Coordination with the State EMS Office and the extent to which the proposed project demonstrates coordination and consistency with the State EMS and trauma care system in place or in the planning phase;

 Reasonableness of the budget proposed and the cost efficiency of the project relative to service vs.

administrative costs.

7. Proposal demonstrates an understanding of the problems with rural EMS and trauma care as they relate to this study and proposes effective measures to minimize these problems.

Allowable Costs

The basis for determining the allowability and allocability of costs charged to PHS grants is set forth in 45 CFR part 74, subpart Q. The four separate sets of cost principles prescribed for recipients of grants for public and private nonprofit entities are: OMB Circular A-87 for State and local governments; OMB Circular A-21 for institutions of higher education; 45 CFR

part 74, Appendix E for hospitals; and OMB Circular A-122 for nonprofit organizations.

Executive Order 12372

Grants awarded under this notice are subject to the provisions of Executive Order 12372, which sets up a system for State and local government review of proposed Federal assistance applications. Applicants (other than federally recognized Indian tribes should contact their State Single Point of Contact (SPOC) as early as possible to alert them to the prospective applications and receive any necessary instructions on the State process. For proposed projects serving more than one State, the applicant is advised to contact the SPOC of each affected State. A current list of SPOCS is included in the application kit. The SPOC has 60 days after the application deadline date to submit its review comments. The granting agency does not guarantee to 'accommodate or explain" for State process recommendations it receives after that date.

The OMB Catalog of Federal Domestic Assistance Number for this program is 93.952.

Dated: May 8, 1992.

John H. Kelso,

Acting Administrator.

BILLING CODE 4160-15-M

Social Security Administration

Privacy Act of 1974; Computer Matching Programs

AGENCY: Social Security Administration (SSA), Department of Health and Human Services (HHS).

ACTION: Publication of Notice of Computer Matching to Comply with Public Law (Pub. L.) 100–503, the Computer Matching and Privacy Protection Act of 1988.

SUMMARY: We are publishing notices of two of the computer matching programs that SSA conducts that are subject to the requirements of Pub. L. 100–503. The purpose of this publication is to meet the reporting and publication requirements of Pub. L. 100–503.

DATES: We filed a report of SSA's matching programs that are subject to Pub. L. 100–503 with the Committee on Governmental Affairs of the Senate and the Committee on Government Operations of the House of Representatives and Office of Information and Regulatory Affairs, Office of Management and Budget on June 14, 1989. The matching programs

are effective as indicated in each of the notices that appear in this publication below.

ADDRESSES: Interested parties may comment on this notice by writing to the Associate Commissioner for Program and Integrity Reviews, 860 Altmeyer, 6401 Security Boulevard, Baltimore, MD 21235. All comments received will be available for public inspection at this address.

FOR FURTHER INFORMATION CONTACT: The Associate Commissioner for Program and Integrity Reviews at the address above.

SUPPLEMENTARY INFORMATION:

A. General

Pub. L. 100–503, the Computer
Matching and Privacy Protection Act of
1988, amended the Privacy Act (5 U.S.C.
552a) by adding certain protections for
individuals applying for and receiving
Federal benefits. The law regulates the
use of computer matching by Federal
agencies when records in a system of
records are matched with other Federal,
State, and local government records.
The amendments require Federal
agencies involved in computer matching
programs to:

(1) Negotiate written agreements with source agencies;

(2) Provide notification to applicants and beneficiaries that their records are subject to matching.

(3) Verify match findings before reducing, suspending or terminating an individual's benefits or payments:

(4) Furnish detailed reports to Congress; and

(5) Establish a Data Integrity Board (DIB) that must approve match agreements.

B. SSA Computer Matches Subject to Pub. L. 100-503

We have taken action to ensure that all of SSA's computer matching programs which were being conducted prior to enactment of Pub. L. 100–503 comply with the requirements of the law. Included below is a brief description of two matches that SSA will be conducting as of July 1, 1992 or later. Also included in this publication are detailed notices of each of the matches.

 SSA State/Local Federal Exchange (SAFE).

Purpose: To enable SSA to determine eligibility for, and entitlement to Social Security title II Retirement, Survivors, and Disability Insurance (RSDI) benefits and Supplemental Security Income (SSI) payments. Also, to disclose information to Federal, State and local government agencies as required or permitted by

Federal law for their administration of income-maintenance programs and health-maintenance programs.

(2) SSA Matching with State Prison Records.

Purpose: To identify certain prisoners receiving title II RSDI and/or title XVI SSI payments who may be ineligible to receive payments.

Dated: June 5, 1992.

Gwendolyn S. King,

Commissioner of Social Security.

Notice of Computer Matching Program, Social Security Administration (SSA) Matching With State/Local Records in the State and Federal Exchange (SAFE) Program

A. Participating Agencies

SSA and State/local governmental agencies.

B. Purpose of the Matching Program

The SAFE match has a two-fold purpose as follows:

(1) SSA is authorized by section 1137(a) of the Social Security Act (the Act) to obtain information from States and the Internal Revenue Service that may affect an individual's—

 Eligibility for, or amount of, payment under the title XVI Supplemental Security Income (SSI) program, and
 Continuing entitlement to, or amount

of, benefits under the title II Retirement, Survivors, or Disability Insurance (RSDI) programs.

(2) SSA provides information to Federal, State, and local agencies as follows:

(a) Social Security benefit information and/or SSI program information is released to Federal, State, and local agencies for determining eligibility for, or the amount of, payment or continuing entitlement or eligibility to benefits/payments under State/locally-administered income-maintenance programs (e.g., Aid to Families with Dependent Children, general assistance, and Medicaid); and to verify Social Security numbers of applicants for, and recipients of such programs; and

(b) Internal Revenue Service tax information is released for:

—State and local agencies for administering certain procertain programs pursuant to 26 U.S.C. 6103(1)(7) (i.e. Aid to Families with Dependent Children under Part A of title IV of the Act, Medicaid under title XIX of the Act, unemployment compensation under section 3304 of the Internal Revenue Code, the food stamp program under the Food Stamp Act of 1977, and any State program

under a plan approved under title I, X, XIV, or XVI of the Act); and

—State and local child support enforcement agencies for administering the child support enforcement program pursuant to 26 U.S.C. 6103(1)(8).

Generally, SSA is the matching agency under the SAFE matching program. However, in some cases, SSA may furnish information to a Federal or State agency which will conduct a matching operation.

C. Authority for Conducting the Matching Program

Sections 205, 1137, and 1631(e)(1)(B) of the Act (42 U.S.C. 405, 1320b-7, and 1383(e)(1)(B) and 26 U.S.C. 6103(l) (7) and (8), and 5 U.S.C. 552a.

D. Categories of Records and Individuals Covered by the Match

The SSA records are payment data pertaining to applicants for, and recipients of title II RSDI benefits and title XVI SSI payments. The RSDI records are maintained in the Master Beneficiary Record system (last published in the Federal Register (FR) on April 1, 1992, pages 12322, 12326-12329); the SSI records are maintained in the Supplemental Security Income Record (last published in the FR on April 9, 1992, pages 12322, 12329–12331). The State and/or local files include records of benefit payments such as State pensions, workers' compensation, general assistance, wage record, and tax files. The IRS tax information consists of net earnings from self-employment (as defined in 28 U.S.C. 1402), wages (as defined in 26 U.S.C. 3121(a) or 3401(a)). and payments of retirement income reported to SSA pursuant to 26 U.S.C. 6103 (1)(1) or (1)(5). This information is maintained in the SSA Earnings Recording and Self-Employment Income System (last published in the FR on September 18, 1991, page 47220).

E. Inclusive Dates of the Matching Program

The matching program will begin 30 days after publication in the FR or 30 days after agreements by the parties participating in the match have been submitted to Congress and the Office of Management and Budget, whichever is later. The matching program will continue for 18 months from the beginning date and may be extended for an additional 12 months thereafter.

F. Address for Receipt of Public Comments or Inquiries

Individuals wishing to comment on this matching program should submit comments to the Associate Commissioner for Program and Integrity Reviews, 860 Altmeyer, 6401 Security Boulevard, Baltimore, Maryland 21235.

Notice of Computer Matching Program, Social Security Administration (SSA) Matching with State Prison Records

A. Participating Agencies

SSA and the State prison systems.

B. Purpose of the Matching Program

The purpose of this matching program is to obtain data from State prison systems to identify individuals who are subject to:

(1) Title II Retirement, Survivors, and Disability Insurance (RSDI) prisoner benefit suspensions under section 202(x) of the Social Security Act (the Act); and

(2) Title XVI Supplementary Security Income (SSI) eligibility restrictions to individuals in public institutions pursuant to section 1611(e)(1)(A) of the Act.

C. Authority for Conducting the Match

Sections 202(x), 1611(e)(1)(A) and 1631(f) of the Act [42 U.S.C. 402(x), 1382(e)(1)(A) and 1383(f)].

D. Categories of Records and Individuals Covered by the Match

SSA will match identifying information received from Statemaintained prison records data with data in the Master Beneficiary Record (MBR) (last published in the Federal Register (FR) on April 9, 1992, pages 12326-12329) and the Supplementary Security Income Record (SSR) (last published in the FR on April 9, 1992 at pages 12322, 12329-12331). The SSA MBR and SSR contain identifying and payment information about individuals applying for benefits/payments under the title II and title XVI programs. The State records contain information about prisoner incarceration such as the prisoner's name, Social Security number, date of birth, sex, date of confinement, place of confinement, and length of sentence (used to determine felony and nonfelony convictions).

E. Inclusive Dates of the Match

The matching program will begin 30 days after publication in the FR or 30 days after agreements by the parties participating in the match have been submitted to Congress and the Office of Management and Budget, whichever is later. The matching program will continue for 18 months from the beginning date and may be extended for an additional 12 months thereafter.

F. Address for Receipt of Public Comments or Inquiries

Individuals wishing to comment on this matching program should submit comments to the Associate Commissioner for Program and Integrity Reviews, 860 Altmeyer, 6401 Security Blvd., Baltimore, MD 21235.

DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT

Office of the Assistant Secretary for Community Planning and Development

[Docket No. N-92-1917; FR-2934-N-82]

Federal Property Suitable as Facilities To Assist the Homeless

AGENCY: Office of the Assistant Secretary for Community Planning and Development, HUD.

ACTION: Notice.

SUMMARY: This Notice identifies unutilized, underutilized, excess, and surplus Federal property reviewed by HUD for suitability for possible use to assist the homeless.

ADDRESSES: For further information, contact James N. Forsberg, room 7262, Department of Housing and Urban Development, 451 Seventh Street SW., Washington, DC 20410; telephone (202) 708–4300; TDD number for the hearing-and speech-impaired (202) 708–2565 (these telephone numbers are not toll-free), or call the toll-free Title V information line at 1–800–927–7588.

SUPPLEMENTARY INFORMATION: In accordance with 56 FR 23789 (May 24, 1991) and section 501 of the Stewart B. McKinney Homeless Assistance Act (42 U.S.C. 11411), as amended, HUD is publishing this Notice to identify Federal buildings and other real property that HUD has reviewed for suitability for use to assist the homeless. The properties were reviewed using information provided to HUD by Federal landholding agencies regarding unutilized and underutilized buildings and real property controlled by such agencies or by GSA regarding its inventory of excess or surplus Federal property. This Notice is also published in order to comply with the December 12, 1988 Court Order in National Coalition for the Homeless v. Veterans Adminsitration, No. 88-2503-OG (D.D.C.).

Properties reviewed are listed in this Notice according to the following categories: Suitable/available, suitable/ unavailable, suitable/to be excess, and unsuitable. The properties listed in the three suitable categories have been reviewed by the landholding agencies, and each agency has transmitted to HUD: (1) Its intention to make the property available for use to assist the homeless, (2) its intention to declare the property excess to the agency's needs, or (3) a statement of the reasons that the property cannot be declared excess or made available for use as facilities to assist the homeless.

Properties listed as suitable/available will be available exclusively for homeless use for a period of 60 days from the date of this Notice. Homeless assistance providers interested in any such property should send a written expression of interest to HHS, addressed to Judy Breitman, Division of Health Facilities Planning, U.S. Public Health Service, HHS, room 17A-10, 5600 Fishers Lane, Rockville, MD 20857; (301) 443-2265. (This is not a toll-free number.) HHS will mail to the interested provider an application packet, which will include instruction for completing the application. In order to maximize the opportunity to utilize a suitable property, providers should submit their written expressions of interest as soon as possible. For complete details concerning the processing of applications, the reader is encouraged to refer to the interim rule governing this program, 56 FR 23789 (May 24, 1991).

For properties listed as suitable/to be excess, that property may, if subsequently accepted as excess by GSA, be made available for use by the homeless in accordance with applicable law, subject to screening for other Federal use. At the appropriate time, HUD will publish the property in a Notice showing it as either suitable/available or suitable/unavailable.

For properties listed as suitable/ unavailable, the landholding agency has decided that the property cannot be declared excess or made available for use to assist the homeless, and the property will not be available.

Properties listed as unsuitable will not be made available for any other purpose for 20 days from the date of this Notice. Homeless assistance providers interested in a review by HUD of the determination of unsuitability should call the toll free information line at 1–800–927–7588 for detailed instructions or write a letter to James N. Forsberg at the address listed at the beginning of this Notice. Included in the request for review should be the property address (including zip code), the date of publication in the Federal Register, the

landholding agency, and the property number.

For more information regarding particular properties identified in this Notice (i.e., acreage, floor plan, existing sanitary facilities, exact street address), providers should contact the appropriate landholding agencies at the following addresses: U.S. Army: Robert Conte, Dept. of Army, Military Facilities, DAEN-ZCI-P; rm. 1E671, Pentagon, Washington, DC 20310-2600; (703) 593-4583; GSA: Ronald Rice, Federal Property Resources Services, GSA, 18th and F Streets NW., Washington, DC 20405; (202) 501-0067; Dept. of Veterans Affairs: Douglas Shinn, Management Analyst, Dept. of Veterans Affairs, room 414 Lafayette Bldg., 811 Vermont Ave. NW., Washington, DC 20420; (202) 233-8474; Dept. of Transportation: Ronald D. Keefer, Director, Administrtive Services & Property Management, DOT, 400 Seventh St., SW., room 10319, Washington, DC 20590; (202) 366-4246; (These are not toll-free numbers).

Dated: June 5, 1992. Paul Roitman Bardack,

Deputy Assistant Secretary for Economic Development.

[FR Doc. 92-13711 Filed 6-11-92; 8:45 am]

Office of the Inspector General

[Docket No. N-92-3452; FR-3260-N-01]

Privacy Act of 1974; Proposed Amendment to a System of Records and New Systems of Records

AGENCY: Office of Inspector General, HUD.

ACTION: Notification of a proposed amendment to an existing system of records and notice of three new systems of records.

summary: Pursuant to the provisions of the Privacy Act of 1974 (5 U.S.C. 552a), the Office of Inspector General is giving notice that it proposes to: (1) Amend an existing system of records entitled "Investigation Files," which was last published on March 20, 1984 (49 FR 10373); and (2) establish three new systems of records entitled "Hotline Complaint Files of the Office of Inspector General," "Name Indices System of the Office of Inspector General," and "Independent Auditor Monitoring Files of the Office of Inspector General."

shall become effective without further notice on July 13, 1992, unless comments are received on or before that date which would result in a contrary determination. Comment Due Date: July 13, 1992.

ADDRESSES: Interested persons are invited to submit comments regarding this rule to the Rules Docket Clerk. Office of General Counsel, room 10276, Department of Housing and Urban Development, 451 Seventh Street, SW., Washington, DC 20410-0500. Communications should refer to the above docket number and title. An original and four copies of comments should be submitted. Facsimile (FAX) comments are not acceptable. A copy of each communication submitted will be available for public inspection and copying between 7:30 a.m. and 5:30 p.m. weekdays at the above address.

Telephone Number (202) 708–2350.
(These are not toll free numbers.)

SUPPLEMENTARY INFORMATION: The Inspector General has determined that the existing "Investigation Files" system notice is in need of updating and revision to more accurately reflect current OIG practices regarding the maintenance of law enforcement investigative information. The system notice is being amended to change the name of the system to "Investigative Files of the Office of Inspector General," which more precisely reflects its coverage and distinguishes it from other OIG systems of records.

The categories of Individuals covered by the system are intended to identify only those individuals about whom records are currently indexed and retrieved-i.e., investigative subjects, complainants, and certain key witnesses. Information about HUD investigators is not indexed and retrieved by their names; thus, they are no longer a category of individuals covered by this system. In addition, the new system notice contains only those routine uses that are currently used by the OIG. Some of these are new routine uses. Other routine uses, such as the Department-wide routine uses that were incorporated by reference into the previous "Investigation Files" system notice, are no longer needed and have been deleted. Finally, the exemption portion of the system notice has been revised to more precisely state the scope of the applicable exemptions.

The Inspector General has also undertaken an internal review of its compliance with the Privacy Act and has determined that three additional systems of records notices are necessary in order to account for information maintained about individuals that is not included within its investigative files system of records. These new OIG systems of records are entitled "Hotline Complaint Files of the Office of Inspector General," "Name Indices System of the Office of Inspector General," and "Independent Auditor Monitoring Files of the Office of Inspector General."

The OIG's four systems of records notices are printed below. A report of the Inspector General's intention to amend the "Investigation Files" system notice, and to establish the three other systems, has been submitted to the Committee on Government Operations of the House of Representatives, the Committee on Governmental Affairs of the Senate, and the Office of Management and Budget ("OMB") pursuant to paragraph 4b of Appendix I to OMB Circular No. A-130, "Federal Agency Responsibilities for Maintaining Records About Individuals," dated December 12, 1985 (50 FR 52730, December 24, 1985).

Dated: June 5, 1992. John J. Connors, Deputy Inspector General.

HUD/OIG-1

SYSTEM NAME:

Investigative Files of the Office of Inspector General.

SYSTEM LOCATION:

Headquarters.

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Individuals covered consist of: (1) HUD program participants and HUD employees who are subjects of OIG inquiries or investigations; and (2) complainants and key witnesses where necessary for future retrieval.

CATEGORIES OF RECORDS IN THE SYSTEM:

Records consist of investigatory material compiled for law enforcement purposes, and include initial complaints filed against subjects or other information relating to potential violations of law, reports of investigation, findings of HUD officials, and recommendations and dispositions to be made.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

The Inspector General Act of 1978, 5 U.S.C. App., authorizes the Inspector General to conduct, supervise and coordinate investigations relating to the programs and operations of HUD.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

- 1. In the event that records indicate a violation or potential violation of law, whether criminal, civil or regulatory in nature, the relevant records may be disclosed to the appropriate federal, state or local agency charged with the responsibility for investigating or prosecuting such violation or enforcing or implementing such statute, rule or regulation.
- 2. Records may be disclosed to a congressional office in response to an inquiry from that congressional office made at the request of the individual who is the subject of the records.
- 3. Records may be disclosed to HUD contractors, Public Housing Authorities or management agents of HUD-assisted housing projects, in order to assist such entities in taking action to recover money or property, where such recovery serves to promote the integrity of the programs or operations of HUD.
- 4. Records may be disclosed during the course of an administrative proceeding where HUD is a party to the litigation and the disclosure is relevant and reasonably necessary to adjudicate the matter.
- Records may be disclosed to any source, either private or governmental, to the extent necessary to elicit information relevant to an OIG investigation.

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM;

STORAGE:

Records are stored manually in file jackets and electronically in office automation equipment.

RETRIEVABILITY:

Records may be retrieved by manual or computer search of indices containing the name of the individual to whom the record pertains.

SAFEGUARDS:

Records are maintained in locked file cabinets or in metal file cabinets in secured rooms or premises with access limited to those persons whose official duties require access. Computer terminals are secured in controlled areas which are locked when unoccupied. Access to automated records is limited to authorized personnel who must use a password system to gain access.

RETENTION AND DISPOSAL:

Retention and disposal is in accordance with General Records Schedule 22 (Inspector General Records), published by the National Archives and Records Administration.

SYSTEM MANAGER(S) AND ADDRESS:

Assistant Inspector General, Office of Management and Policy, Office of the Inspector General, Department of Housing and Urban Development, 451 Seventh Street, SW., Washington, DC 20410.

NOTIFICATION PROCEDURE:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for notification of whether the system contains records pertaining to that individual.

RECORD ACCESS PROCEDURES:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for access to records pertaining to that individual. The procedures for requesting access to records appear in 24 CFR parts 16 and 2003.

CONTESTING RECORD PROCEDURES:

Records are generally exempt from Privacy Act amendment or correction. However, the System Manager will give consideration to a request from an individual for amendment or correction of records pertaining to that individual. The procedures for requesting

amendment or correction of records appear in 24 CFR part 16.

RECORD SOURCE CATEGORIES:

The OIG collects information from a wide variety of sources, including from HUD, law enforcement agencies, program participants, subject individuals, complainants, witnesses and other nongovernmental sources.

EXEMPTIONS FROM CERTAIN PROVISIONS OF THE ACT:

This system of records, to the extent that it consists of information compiled for the purpose of criminal investigations, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2), (e)(1), (e)(2) and (e)(3) of the Privacy Act pursuant to 5 U.S.C. 552a(j)(2). In addition, this system of records, to the extent that it consists of other investigatory material compiled for law enforcement purposes, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2) and (e)(1) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(2). Finally, this system of records, to the extent that it consists of investigatory material compiled for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment or Federal contracts, the release of which would reveal the identity of a source who furnished information to the Government under an express promise that the identity of the source would be held in confidence, has been exempted from the requirements of subsection (d)(1) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(5). Rules have been promulgated in accordance with the requirements of 5 U.S.C. 553(b), (c) and (e) and have been published in the Federal Register.

HUD/OIG-2

SYSTEM NAME:

Hotline Complaint Files of the Office of Inspector General.

SYSTEM LOCATION:

Headquarters

CATEGORIES OF INDIVIDUALS COVERED BY THE SYSTEM:

Individuals covered consist of: (1)
HUD program participants and HUD
employees who are subjects of hotline
complaints alleging possible violations
of law, rules or regulations,
mismanagement, gross waste of funds,
abuse of authority or a substantial and
specific danger to the public health and
safety; and (2) HUD employees and
members of the general public who are
complainants.

CATEGORIES OF RECORDS IN THE SYSTEM:

Records consist of all forms and documentation generated by the complaint, including recommended and final disposition of the matter.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

The Inspector General Act of 1978, 5
U.S.C. App., authorizes the Inspector
General to conduct, supervise and
coordinate activities that promote
economy and efficiency in the programs
and operations of HUD, and to receive
and investigate complaints concerning
possible violations of law, rules, or
regulations, or mismanagement, gross
waste of funds, abuse of authority or a
substantial and specific danger to the
public health or safety.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

- 1. In the event that records indicate a violation or potential violation of law, whether criminal, civil or regulatory in nature, the relevant records may be disclosed to the appropriate federal, state or local agency charged with the responsibility for investigating or prosecuting such violation or enforcing or implementing such statute, rule or regulation.
- Records may be disclosed to a congressional office in response to an inquiry from that congressional office made at the request of the individual who is the subject of the records.
- 3. Records may be disclosed to HUD contractors, Public Housing Authorities or management agents of HUD-assisted housing projects, in order to assist such entities in taking action to recover money or property, where such recovery serves to promote the integrity of the programs or operations of HUD.
- 4. Records may be disclosed during the course of an administrative proceeding where HUD is a party to the litigation and the disclosure is relevant and reasonably necessary to adjudicate the matter.
- Records may be disclosed to any source, either private or governmental, to the extent necessary to elicit information relevant to an OIG hotline complaint.

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM:

STORAGE:

Records are stored manually in file jackets and electronically in office automation equipment.

RETRIEVABILITY:

Records may be retrieved by manual or computer search of indices containing the name of the individual to whom the record pertains.

SAFEGUARDS:

Records are maintained in locked file cabinets or in metal file cabinets in secured rooms or premises with access limited to those persons whose official duties require access. Computer terminals are secured in controlled areas which are locked when unoccupied. Access to automated records is limited to authorized personnel who must use a password system to gain access.

RETENTION AND DISPOSAL:

Retention and disposal is in accordance with General Records Schedule 22 (Inspector General Records), published by the National Archives and Records Administration.

SYSTEM MANAGER(S) AND ADDRESS:

Assistant Inspector General, Office of Management and Policy, Office of the Inspector General, Department of Housing and Urban Development, 451 Seventh Street, SW., Washington, DC 20410.

NOTIFICATION PROCEDURE:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for notification of whether the system contains records pertaining to that individual.

RECORD ACCESS PROCEDURES:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for access to records pertaining to that individual. The procedures for requesting access to records appear in 24 CFR parts 16 and 2003.

CONTESTING RECORD PROCEDURES:

Records are generally exempt from Privacy Act amendment or correction. However, the System Manager will give consideration to a request from an individual for amendment or correction of records pertaining to that individual. The procedures for requesting amendment or correction of records appear in 24 CFR part 16.

RECORD SOURCE CATEGORIES:

The OIG collects information from a wide variety of sources, including from HUD, the General Accounting Office, other federal agencies, program

participants, subject individuals, complainants, witnesses and other nongovernmental sources.

EXEMPTIONS FROM CERTAIN PROVISIONS OF THE ACT:

This system of records, to the extent that it consists of information compiled for the purpose of criminal investigations, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2), (e)(1), (e)(2) and (e)(3) of the Privacy Act pursuant to 5 U.S.C. 552a(j)(2). In addition, this system of records, to the extent that it consists of other investigatory material compiled for law enforcement purposes, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2) and (e)(1) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(2). Finally, this system of records, to the extent that it consists of investigatory material compiled for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment or Federal contracts, the release of which would reveal the identity of a source who furnished information to the Government under an express promise that the identity of the source would be held in confidence, has been exempted from the requirements of subsection (d)(1) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(5). Rules have been promulgated in accordance with the requirements of 5 U.S.C. 553(b), (c) and (e) and have been published in the Federal Register.

HUD/OIG-3

SYSTEM NAME:

Name Indices System of the Office of Inspector General.

SYSTEM LOCATION:

Headquarters.

CATEGORIES OF INDIVIDUALS COVERED BY THE

Individuals covered consist of HUD program participants and HUD employees who have had some significant association with an OIG investigation, audit report, or hotline complaint.

CATEGORIES OF RECORDS IN THE SYSTEM:

Records are contained in a computerized central reference system and can consist of one or more of the following items: Individual's name; alias or associated name; period covered by the audit; date of birth; report date; city and state where the individual is located; social security number or employer identification number; and the date the case was closed. This information is cross-referenced to an

underlying OIG investigation, audit report, hotline complaint file number, or a departmental suspension/debarment or Mortgagee Review Board action.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

The Inspector General Act of 1978, 5 U.S.C. App., authorizes the Inspector General to conduct, supervise and coordinate audits and investigations related to the programs and operations of HUD, to engage in other activities that promote economy and efficiency in the programs and operations of HUD, and to receive and investigate complaints concerning possible violations of law, rules, or regulations, or mismanagement, gross waste of funds, abuse of authority or a substantial and specific danger to the public health or safety.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

None. Records in this system are only disclosed to officers and employees of HUD who have a need for such records in the performance of their official duties. However, records contained in other OIG systems of records may be disclosed pursuant to the routine uses that are applicable to those systems.

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM:

STORAGE

Records are stored electronically in office automation equipment, and on Microfiche.

RETRIEVABILITY:

Records may be retrieved through computer search by the name of the individual to whom the record pertains.

SAFEGUARDS:

Computer terminals are secured in controlled areas which are locked when unoccupied. Access to records is limited to authorized personnel who must use a password system to gain access.

RETENTION AND DISPOSAL:

Retention and disposal is in accordance with Records Disposition Schedule 3 (Administrative Records), Item No. 84, Appendix 3, HUD Handbook 2225.3 Rev-1.

SYSTEM MANAGER(S) AND ADDRESS:

Assistant Inspector General, Office of Management and Policy, Office of the Inspector General, Department of Housing and Urban Development, 451 Seventh Street, SW., Washington, DC 20410.

NOTIFICATION PROCEDURE:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for notification of whether the system contains records pertaining to that individual.

RECORD ACCESS PROCEDURES:

Records are generally exempt from Privacy Act access. However, the System Manager will give consideration to a request from an individual for access to records pertaining to that individual. The procedures for requesting access to records appear in 24 CFR parts 16 and 2003.

CONTESTING RECORD PROCEDURES:

Records are generally exempt from Privacy Act amendment or correction. However, the System Manager will give consideration to a request from an individual for amendment or correction of records pertaining to that individual. The procedures for requesting amendment or correction of records appear in 24 CFR part 16.

RECORD SOURCE CATEGORIES:

The OIG collects information from a wide variety of sources, including from HUD, the General Accounting Office, other federal agencies, program participants, subject individuals, complainants, witnesses and other nongovernmental sources.

EXEMPTIONS FROM CERTAIN PROVISIONS OF THE ACT:

This system of records, to the extent that it consists of information compiled for the purpose of criminal investigations, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2), (e)(1), (e)(2) and (e)(3) of the Privacy Act pursuant to 5 U.S.C. 552a(j)(2). In addition, this system of records, to the extent that it consists of other investigatory material compiled for law enforcement purposes, has been exempted from the requirements of subsections (c)(3), (d)(1), (d)(2) and (e)(1) of the Privacy Act pursuant to 5 U.S.C. 552a(k)(2). Finally, this system of records, to the extent that it consists of investigatory material compiled for the purpose of determining suitability, eligibility, or qualifications for Federal civilian employment or Federal contracts, the release of which would reveal the identity of a source who furnished information to the Government under an express promise that the identity of the source would be held in confidence, has been exempted from the requirements of subsection (d)(1) of the Privacy Act pursuant to 5

U.S.C. 552a(k)(5). Rules have been promulgated in accordance with the requirements of 5 U.S.C. 553(b), (c) and (e) and have been published in the Federal Register.

HUD/OIG-4

SYSTEM NAME:

Independent Auditor Monitoring Files of the Office of Inspector General.

SYSTEM LOCATION:

Cherry Hill, New Jersey.

CATEGORIES OF INDIVIDUALS COVERED BY THE

Individuals covered are non-federal independent auditors who have conducted audits of recipients of Federal funds received under HUD's programs. An independent auditor is: (a) A licensed certified public accountant or a person working for a licensed certified public accountant licensed on or before December 31, 1970, or a person working for a public accounting firm licensed on or before December 31, 1970.

CATEGORIES OF RECORDS IN THE SYSTEM:

Records consist of materials generated in connection with quality control reviews of the working papers of independent auditors, including standardized checklists for evaluating an independent auditor's work performance.

AUTHORITY FOR MAINTENANCE OF THE SYSTEM:

The Inspector General Act of 1978, 5 U.S.C. App., requires the Inspector General to assure that any work performed by non-federal auditors complies with the auditing standards established by the Comptroller General of the United States for audits of federal establishments, organizations, programs, activities and functions.

ROUTINE USES OF RECORDS MAINTAINED IN THE SYSTEM, INCLUDING CATEGORIES OF USERS AND THE PURPOSES OF SUCH USES:

1. In the event that records indicate a violation or potential violation of law, whether criminal, civil or regulatory in nature, the relevant records may be disclosed to the appropriate federal, state or local agency charged with the responsibility for investigating or prosecuting such violation or enforcing or implementing such statute, rule or regulation.

2. In the event that records indicate pervasively unreliable or seriously deficient work by an independent auditor, the relevant records may be disclosed to an appropriate State board of accountancy for possible administrative or disciplinary sanctions

such as license revocation. These referrals will be made only after the independent auditor has been notified that the OIG is contemplating disclosure of its findings to an appropriate state board of accountancy, and the independent accountant has been provided with an opportunity to respond in writing to the OIG's findings.

3. In the event that records indicate pervasively unreliable or seriously deficient work by an independent auditor, the relevant records may be disclosed to an auditee who is a HUD program participant, such as a Public Housing Authority, in order to assist such auditee in evaluating its contractual relationship with the independent auditor. These referrals will be made only after the independent auditor has been notified that the OIG is contemplating disclosure of its findings to the auditee, and the independent accountant has been provided with an opportunity to respond in writing to the OIG's findings.

4. Records may be disclosed to a congressional office in response to an inquiry from that congressional office made at the request of the individual who is the subject of the records.

5. Records may be disclosed during the course of an administrative proceeding where HUD is a party to the litigation and the disclosure is relevant and reasonably necessary to adjudicate the matter.

POLICIES AND PRACTICES FOR STORING, RETRIEVING, ACCESSING, RETAINING, AND DISPOSING OF RECORDS IN THE SYSTEM:

STORAGE:

Records are stored manually in file jackets and electronically in office automation equipment.

RETRIEVABILITY:

Records may be retrieved by manual or computer search of indices containing the name of the individual to whom the record pertains.

SAFEGUARDS:

Records are maintained in locked file cabinets or in metal file cabinets in secured rooms or premises with access limited to those persons whose official duties require access. Computer terminals are secured in controlled areas which are locked when unoccupied. Access to automated records is limited to authorized personnel who must use a password system to gain access.

RETENTION AND DISPOSAL:

Retention and disposal is in accordance with General Records Schedule 22 (Inspector General Records), published by the National Archives and Records Administration.

SYSTEM MANAGER(S) AND ADDRESSES:

Assistant Inspector General, Office of Management and Policy, Office of the Inspector General, Department of Housing and Urban Development, 451 Seventh Street, SW., Washington, DC 20410.

NOTIFICATION PROCEDURE:

The System Manager will accept inquiries from an individual seeking notification of whether the system contains records pertaining to that individual.

RECORD ACCESS PROCEDURES:

The procedures for requesting access to records appear in 24 CFR parts 16 and 2003.

CONTESTING RECORD PROCEDURES:

The procedures for requesting amendment or correction of records appear in 24 CFR part 16.

RECORD SOURCE CATEGORIES:

The OIG collects information from the subject independent auditor, HUD, auditees, program participants, complainants and other nongovernmental sources.

EXEMPTIONS FROM CERTAIN PROVISIONS OF THE ACT:

None.

DEPARTMENT OF THE INTERIOR

Bureau of Land Management

[CA-060-02-4130-09]

Proposed Amendment to the Mining Plan of Operation for Open Pit Mining, Baltic Mine, Kern County, CA; Correction

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice of Availability of Draft Baltic Mine Plan of Operation Environmental Impact Statement; Correction.

SUMMARY: In notice document 92–11978 beginning on page 22820 in the issue of Friday, May 29, 1992, make the following corrections:

On page 22820, in the third column, final paragraph, the date for the public meeting to be held in Johannesburg, California, is given as June 30, 1992, at 7 p.m. That date is incorrect. The correct

date for the public meeting is Monday, June 29, 1992 at 7 p.m.

Lee Delaney,

Area Manager.

[FR Doc. 92-13833 Filed 6-11-92; 8:45 am]

[NV-930-92-4212-13; N-53583]

Realty Actions, Sales, Leases, etc.: Nevada

June 4, 1992.

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice; Issurance of Land Exchange Conveyance Document, Nevada.

summary: This notice identifies Federal and non-Federal lands involved in a recently completed exchange transaction. With the exception of oil and gas, the mineral estate in the Federal lands was conveyed with the surface estate. As to the non-Federal lands, the United States acquired only those minerals owned by the proponent.

EFFECTIVE DATE: July 13, 1992.

FOR FURTHER INFORMATION CONTACT: Mary Clark, Nevada State Office, Bureau of Land Management, P.O. Box 12000, Reno, NV 89520, (702) 785–6530.

SUPPLEMENTARY INFORMATION: On March 19, 1992, the United States issued Patent No. 27-92-0013 to Tropicana Durango Ltd. I, a Limited Partnership, for the following described land pursuant to section 206 of the Act of October 31, 1976 (43 U.S.C. 1716):

Mount Diablo Meridian, Nevada

T. 21 S., R. 60 E.,

Sec. 20, E½NE¼SE¼SW¼, E½SW¼N E¼SE¼, E½E½NW¼SE¼, SW¼NW¼SE¼, W½NW¼SW¼SE¼; Sec. 29, SE¼NW¼NE¼, E½SE¼S W¼NE¼, E½SW¼SE¼NE¼, W½SE¼SE¼NE¼, E½NW¼NE¼SE¼.

The area described contains 65 acres in Clark County, Nevada.

In exchange for those lends, the United States acquired the following described land from the above-named party:

Mount Diablo Meridian, Nevada

T. 21 S., R. 59 E., Sec. 6, Parcel C. T. 14 S., R. 69 E., Sec. 28, SE4SW4, SW4,SE4; Sec. 32, SE4NE4; Sec. 33, W½NW4NE4, NE4NW4, W½NW4.

The area described contains 299 acres in Clark County, Nevada. Title to the non-Federal land was accepted on March 19, 1992.

The value of the Federal lands exceeded the value non-Federal lands

by \$45,000.00. An equalization payment in that amount was paid to the United States by the exchange proponent.

This exchange resulted in the United States acquiring 39 acres of land for inclusion in the Red Rock Canyon National Conservation Area (RRCNCA) and 260 acres in the Virgin River area.

In accordance with Public Law 101–621, dated November 16, 1990, the RRCNCA lands are withdrawn from all forms of entry, appropriation, or disposal under the public land laws, from location, entry and patent under the mining laws, and from operation under the mineral leasing and geothermal leasing laws, and all amendments thereto.

Because of their high value for cultural resources, riparian and desert tortoise habitat, the Virgin River lands will not be opened to the operation of the public land laws, or the mining and mineral leasing laws.

Marla B. Bohl,

Chief, Branch of Lands and Minerals Operations.

[FR Doc. 92-13803 Filed 6-11-92; 8:45 am] BILLING CODE 4310-HC-M

[NV-930-92-4212-13; N-50567]

Realty Actions; Sales, Leases, etc: Nevada

June 2, 1992.

AGENCY: Bureau of Land Management, Interior.

ACTION: Notice; Issuance of Land Exchange Conveyance Document and Order Providing for Opening of Land, Nevada

summary: This notice identifies Federal and non-Federal land involved in a recently completed exchange transaction. The mineral estate in the Federal and non-Federal land was conveyed simultaneously with the surface estate.

EFFECTIVE DATE: July 13, 1992.

FOR FURTHER INFORMATION CONTACT: Mary Clark, Nevada State Office, Bureau of Land Management, P.O. Box 12000, Reno, NV 89520, (702) 785–6530.

SUPPLEMENTARY INFORMATION: On May 29, 1992, the United States issued Patent No. 27-92-0019 to Newmont Gold Company for the following described land pursuant to section 206 of the Act of October 21, 1976 (43 U.S.C. 1716):

Mount Diablo Meridian, Nevada

T. 34 N., R. 51 E., Sec. 2, lots 2, 3, 4, E\s\W\4\NW\4, SE\4\NW\4.

The area described contains 183.48 acres in Eureka County, Nevada.

In exchange for that land, the United States acquired the following described land from the above-named party:

Mount Diablo Meridian, Nevada

T. 37 N., R. 55 E.,

Sec. 27, NE4, NW 4SE4, E4SE4.

The area described contains 280 acres in Elko County, Nevada. Title to the non-Federal land was accepted on May 19, 1992.

The value of the Federal land exceeded the value of the non-Federal land by \$6,700.00. An equalization payment in that amount was made to the United States by Newmont Gold Company.

The purpose of the exchange was for the United States to acquire non-Federal land with high values for mule deer and antelope summer range, sage grouse nesting and brood rearing habitat, habitat for nongame birds and mammals, and watershed for Dorsey Creek which supports Lahontan cutthroat trout, a Federally listed threatened species.

Initially, the following described Federal land was being considered as part of the subject exchange transaction; however, an acreage adjustment was necessary and said land was deleted from the exchange proposal:

Mount Diablo Meridian, Nevada

T. 34 N., R. 51 E.

Sec. 2, W%SW%NW%, W%SW%.

The area described contains 100 acres in Eureka County, Nevada.

At 10 a.m. on July 13, 1992, the land acquired by the United States and the land deleted from the exchange proposal will be open to the operation of the public land laws generally, subject to valid existing rights, the provisions of existing withdrawals, and the requirements of applicable law.

All valid applications received at or prior to 10 a.m. on July 13, 1992, shall be considered as simultaneously filed at that time. Those received thereafter shall be considered in the order of filing.

At 10 a.m. on July 13, 1992, the land acquired by the United States and the land deleted from the exchange proposal will be open to location under the United States mining laws, and to applications/offers under the mineral leasing laws, the material sale laws, and the Geothermal Steam Act.

Appropriation of the land under the general mining laws prior to the date and time of restoration is unauthorized. Any such attempted appropriation, including attempted adverse possession under 30 U.S.C. 38, shall vest no rights against the United States. Acts required to establish a location and to initiate a right to possession are governed by

State law where not in conflict with Federal law. The Bureau of Land Management will not intervene in disputes between rival locators over possessory rights since Congress has provided for such determinations in local courts.

Billy R. Templeton,

State Director, Nevada.

[FR Doc. 92-13804 Filed 6-11-92; 8:45 am] BILLING CODE 4310-HC-M

[NV-930-92-4212-14; N-45233]

Realty Action: Non-Competitive Sale of Public Lands in Clark County, NV

The following described public land in the town of Mesquite, Clark County, Nevada, has been determined to be suitable for sale utilizing noncompetitive procedures under the Act of October 27, 1986; 100 Stat. 3061 (Pub. L. 99–548).

Mount Diablo Meridian, Nevada

T. 13 S., R. 70 E.,

Sec. 13: N½NE¼, SW¼NE¼, NW¼SE¼ T. 13 S., R. 71 E.,

Sec. 3: Lots 6 through 12, SW1/4NW1/4, W1/2SW1/4

Sec. 4: Lots 5 and 12, SE¼NE¼, E½SE¼

Sec. 7: S1/2

Sec. 8: NE 4/NE 4

Sec. 9: NW 4NW 4 Sec. 18: Lots 5 through 7, NW 4NE 4

Comprising 1232.46 acres of public land.

These lands are being offered as a direct sale to the City of Mesquite as a result of Public Law 99-548, which directs the Secretary of the Interior to sell certain lands to allow for community expansion. The lands will be sold at not less than fair market value as determined by appraisal. A deposit of fifteen (15) percent of the appraised fair market value must be paid to the Bureau of Land Management, Las Vegas District Office, no later than thirty (30) days from sale offering. The balance of the full purchase price shall be paid within 180 days of the City's posting of sale deposit.

The subject land is not needed for any federal purposes. The sale is compatible with the Clark County land use plan. The sale of the described land would be in the public interest.

In the event of a sale, conveyance of the available mineral interests will occur simultaneously with the sale of the land. Acceptance of a direct sale offer will constitute an application for conveyance of those mineral interests. The applicant will be required to pay a \$50.00 non-returnable filing fee for conveyance of the available mineral interests.

Lands to be transferred from the United States will be subject to the following easements, reservations and exceptions:

1. Excepting and reserving to the United States of America a right-of-way for ditches and canals constructed pursuant to the Act of August 30, 1890 [43 U.S.C. 945].2.

2. All oil, gas, potassium, sodium, sand and gravel mineral deposits are reserved to the United States, together with the right to prospect for, mine and extract these minerals.

and will be subject to:

1. Those rights for highway purposes which have been granted to the Nevada Department of Transportation by right-of-way number N-125 under the Act of August 27, 1958 (23 U.S.C. 317).

2. Those rights for airport purposes which have been granted to the City of Mesquite by lease number N-43266 under the Act of May 24, 1928; 45 Stat.

0728; 49 U.S.C. 211–214.
3. Those rights for detention basin purposes which have been granted to the City of Mesquite by right-of-way number N-47155 under the Act of October 21, 1976; 90 Stat. 2776; 43 U.S.C. 1761.

4. Those rights for a sanitary landfill which have been granted to the City of Mesquite by lease number New-00616 under the act of June 14, 1926; 44 Stat. 0741; 43 U.S.C. 869.

5. Those rights for a sewage treatment facility which have been granted to the Clark County Sanitation District by lease number N-37133 under the Act of June 14, 1926; 44 Stat. 0741; 43 U.S.C. 869.

Publication of this notice in the Federal Register will segregate the public lands described above from all forms of appropriation under the public land laws, including the general mining laws for a period of 270 days from date of publication.

For a period of 45 days from date of first publication, interested parties may submit comments or request information from the District Manager, Bureau of Land Management, P.O. Box 26569, Las Vegas, Nevada 89126.

Dated: June 1, 1992

Ben Collins,

District Manager.

BILLING CODE 4310-HC-M

National Park Service

Maine Acadian Culture Preservation Commission; Meeting

Notice is hereby given in accordance with the Federal Advisory Committee Act (Pub. L. 92–463, 86 Stat. 770, 5 U.S.C.

app. 1 & 10), that the first meeting of the Maine Acadian Culture Preservation Commission will be held Thursday, June 25, 1992.

The Committee was established pursuant to Public Law 101–543. The purpose of the Committee is to consult with the Secretary of the Interior and to advise the Secretary with respect to the development and implementation of an interpretive program of Acadian culture in the State of Maine and the selection of sites for interpretation and preservation by means of cooperative agreements.

The meeting will convene at 7 p.m. at the Wisdom Junior/Senior High School on Route 162 in St. Agatha, Aroostook County, Maine. Maine Route 162 intersects U.S. Route One at Frenchville, Maine. The agenda for the first meeting is as follows:

1. Overview of the role of the Maine Acadian Culture Preservation Commission and swearing-in of Commission members;

2. Overview of the National Park Service activities conducted and planned pursuant to the Maine Acadian Culture Preservation Act;

3. Proposed agenda, place and date of the next Commission meeting;

4. Opportunity for Public Comment.
The meeting is open to the public.
Interested persons may make oral or
written presentations to the Commission
or file written statements. Such requests
should be made to the Superintendent at
least seven days prior to the meeting.

Further information concerning these meetings may be obtained from the Superintendent, Acadia National Park, P.O. Box 177, Bar Harbor, Maine 04609, telephone: [207] 288–5472.

Dated: May 26, 1992.

John J. Burchill,

Acting Regional Director.

BILLING CODE 4310-70-M

INTERNATIONAL TRADE COMMISSION

[Investigation No. 701-TA-313 (Final)]

Portable Seismographs From Canada

AGENCY: United States International Trade Commission.

ACTION: Institution and scheduling of a final countervailing duty investigation.

SUMMARY: The Commission hereby gives notice of the institution of final countervailing duty investigation No. 701–TA-313 (Final) under section 705(b) of the Tariff Act of 1930 (19 U.S.C.

1671d(b)) (the Act) to determine whether an industry in the United States is materially injured, or is threatened with material injury, or the establishment of an industry in the United States is materially retarded, by reason of imports from Canada of portable seismographs, provided for in subheading 9015.80.60 of the Harmonized Tariff Schedule of the United States.

For further information concerning the conduct of this investigation, hearing procedures, and rules of general application, consult the Commission's Rules of Practice and Procedure, part 201, subparts A through E (19 CFR part 201), and part 207, subparts A and C (19 CFR part 207).

EFFECTIVE DATE: May 13, 1992.

FOR FURTHER INFORMATION CONTACT:
Larry Reavis (202–205–3185), Office of
Investigations, U.S. International Trade
Commission, 500 E Street SW.,
Washington, DC 20436. Hearingimpaired persons can obtain information
on this matter by contacting the
Commission's TDD terminal on 202–205–
1810. Persons with mobility impairments
who will need special assistance in
gaining access to the Commission
should contact the Office of the
Secretary at 202–205–2000.

SUPPLEMENTARY INFORMATION:

Background

This investigation is being instituted as a result of an affirmative preliminary determination by the Department of Commerce that certain benefits which constitute subsidies within the meaning of section 703 of the Act (19 U.S.C. 1671b) are being provided to manufacturers, producers, or exporters in Canada of portable seismographs. The investigation was requested in a petition filed on February 12, 1992, by GeoSonics Inc., Warrendale, PA.

Participation in the Investigation and Public Service List

Persons wishing to participate in the investigation as parties must file an entry of appearance with the Secretary to the Commission, as provided in section 201.11 of the Commission's rules, not later than twenty-one (21) days after publication of this notice in the Federal Register. The Secretary will prepare a public service list containing the names and addresses of all persons, or their representatives, who are parties to this investigation upon the expiration of the period for filing entries of appearance.

Limited Disclosure of Business Proprietary Information (BPI) Under an Administrative Protective Order (APO) and BPI Service List

Pursuant to § 207.7(a) of the Commission's rules, the Secretary will make BPI gathered in this final investigation available to authorized applicants under the APO issued in the investigation, provided that the application is made not later than twenty-one (21) days after the publication of this notice in the Federal Register. A separate service list will be maintained by the Secretary for those parties authorized to receive BPI under the APO.

Staff Report

The prehearing staff report in this investigation will be placed in the nonpublic record on July 10, 1992, and a public version will be issued thereafter, pursuant to § 207.21 of the Commission's rules.

Hearing

The Commission will hold a hearing in connection with this investigation beginning at 9:30 a.m. on July 23, 1992, at the U.S. International Trade Commission Building. Requests to appear at the hearing should be filed in writing with the Secretary to the Commission on or before Jule 10. A nonparty who has testimony that may aid the Commission's deliberations may request permission to present a short statement at the hearing. All parties and nonparties desiring to appear at the hearing and make oral presentations should attend a prehearing conference to be held at 9:30 a.m. on July 15, 1992, at the U.S. International Trade Commission Building. Oral testimony and written materials to be submitted at the public hearing are governed by §§ 201.6(b)(2), 201.13(f), and 207.23(b) of the Commission's rules.

Written Submissions

Each party is encouraged to submit a prehearing brief to the Commission. Prehearing briefs must conform with the provisions of § 207.22 of the Commission's rules; the deadline for filing is July 17, 1992. Parties may also file written testimony in connection with their presentation at the hearing, as provided in § 207.23(b) of the Commission's rules, and posthearing briefs, which must conform with the provisions of § 207.24 of the Commission's rules. The deadline for filing posthearing briefs is July 31, 1992; witness testimony must be filed no later than three (3) days before the hearing. In addition, any person who has not

entered an appearance as a party to the investigation may submit a written statement of information pertinent to the subject of the investigation on or before July 31, 1992. All written submissions must conform with the provisions of § 201.8 of the Commission's rules; any submissions that contain BPI must also conform with the requirements of § § 201.6, 207.3, and 207.7 of the Commission's rules.

In accordance with §§ 201.16(c) and 207.3 of the rules, each document filed by a party to the investigation must be served on all other parties to the investigation (as identified by either the public of BPI service list), and a certificate of service must be timely filed. The Secretary will not accept a document for filing without a certificate of service.

Authority: This investigation is being conducted under authority of the Tariff Act of 1930, title VII. This notice is published pursuant to § 207.20 of the Commission's rules.

Issued: June 8,1992.

By order of the Commission.

Kenneth R. Mason,

Secretary.

[FR Doc. 92-13826 Filed 6-11-92; 8:45 am] BILLING CODE 7020-02-M

INTERSTATE COMMERCE COMMISSION

[Finance Docket No. 32080]

Norfolk and Western Railway Co., Trackage Rights Exemption; Eigin, Jollet and Eastern Railway Co.

Norfolk and Western Railway Company (NW) has filed a notice of exemption under 49 CFR 1180.2(d)(7) for its acquisition from Elgin, Joliet and Eastern Railway Company (EJE) of overhead trackage rights over EJE's approximately 255-foot line of railroad in Chicago, Cook County, IL, between a junction with NW's line at or near milepost 506.22 and private trackage formerly owned by U.S. Steel Supply Company (USS). NW will use the trackage rights to gain access to shippers located on the former USS trackage. The transaction is to be consummated on June 17, 1992.

Any comments must be filed with the Commission and served on: James L. Howe III, Norfolk and Western Railway Company, Three Commerical Place, Norfolk, VA 23510–2191.

As a condition to the use of this exemption, any employees adversely affected by the transaction will be protected under *Norfolk and Western*

Ry. Co.—Trackage Rights—BN, 354, I.C.C. 605 (1978), as modified in Mendocino Coast Ry., Inc.—Lease and Operate, 360 I.C.C. 653 (1980).

If the notice contains false or misleading information, the exemption is void *ab initio*. Petitions to reopen and revoke the exemption under 49 U.S.C. 10505(d) may be filed at any time. The filing of a petition to reopen will not stay the effectiveness of the exemption.

Decided: June 5, 1992.

By the Commission, Joseph H. Dettmar, Acting Director, Office of Proceedings. Sidney L. Strickland, Jr.,

Secretary.

[FR Doc. 92-13875 Filed 6-11-92; 8:45 am]

DEPARTMENT OF JUSTICE

Lodging Consent Decree for Claims Under Section 107(a) of the Comprehensive Environmental Response, Compensation, and Liability Act

Notice is hereby given that on June 2, 1992, a proposed consent decree in United States v. SKRL Die Casting, et al., Civil Action No. 5:90 CV 609, was lodged with the United States District Court for the Northern District of Ohio. The proposed consent decree resolves claims asserted by the United States under Section 107 of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 ("CERCLA"). as amended, 42 U.S.C. 9607, for recovery of response costs incurred by the United States with respect to the Petroleum & Power Maintenance Site ("PPM Site") located in Louisville, Ohio. The complaint in this action alleged that defendants SKRL Die Casting, Chrysler Motors Corporation, Pittsburg & Midway Coal Mining Company and USX Corporation were liable under CERCLA because they generated hazardous substances and arranged for the disposal or treatment of these substances at the PPM Site.

Under the terms of the proposed consent decress, the four defendants will pay the United States \$230,000 within thirty days of entry of the decree for reimbursement of response costs incurred in connection with the PPM Site. The proposed consent decree also resolves contribution claims asserted by three defendants under section 113 of CERCLA against the United States

Navy.

The Department of Justice will receive comments relating to the proposed consent decree for a period of thirty days from the date of this publication. Comments should be addressed to the

Assistant Attorney General of the Environment and Natural Resources Division, Department of Justice, P.O. Box 7611, Ben Franklin Station, Washington, DC 20044, and should refer to *United States v. SKRL Die Casting, et al.*, D.J. Ref. No. 90–11–3 599.

The proposed consent decree may be examined at the Region V Office of the U.S. Environmental Protection Agency, 230 South Dearborn Street, Chicago, Illinois 60604. Copies of the proposed consent decree may also be obtained in person or by mail from the Environmental Enforcement Section Document Center, 601 Pennsylvania Ave., NW., Box 1097, Washington, DC 20004 [[202) 347–7829]. Any request for a copy of the decree must be accompanied by a check in the amount of \$3.25 (13 pages at 25 cents per page reproduction cost) payable to "Consent Decree Library."

John C. Cruden,

Section Chief, Environmental Enforcement Section, Environment and Natural Resources Division.

[FR Doc. 92-13741 Filed 6-11-92; 8:45 am] BILLING CODE 4410-01-M

Drug Enforcement Administration

George T. Zahorian, III, D.O.; Revocation of Registration

On March 19, 1992, the Deputy Assistant Administrator, Office of Diversion Control, Drug Enforcement Administration (DEA), issued an Order to Show Cause to George T. Zahorian, III, D.O., of 845 Sir Thomas Court, Suite 4, Harrisburg, Pennsylvania 17109, proposing to revoke his DEA Certificate of Registration, AZ7037004, and to deny any pending applications for registration as a practitioner under 21 U.S.C. 823(f). The proposed action was predicated on Dr. Zahorian's lack of authorization to handle controlled substances in the Commonwealth of Pennsylvania. 21 U.S.C. 824(a)(3). The Order to Show Cause also alleged that Dr. Zahorian's continued registration would be inconsistent with the public interest as that term is used in 21 U.S.C. 823(f) and 21 U.S.C. 824(a)(4) and that Dr. Zahorian had been convicted of felonies relating to controlled substances, as that term is used in 21 U.S.C. 824(a)(2), in the United States District Court for the Middle District of Pennsylvania on June 27,

The Order to Show Cause was sent to Dr. Zahorian by registered mail. More than thirty days have passed since the Order to Show Cause was received by Dr. Zahorian and the Drug Enforcement Administration has received no

response thereto. Pursuant to 21 CFR 1301.54(a) and 1301.54(d), George T. Zahorian, III, D.O., is deemed to have waived his opportunity for a hearing. Accordingly, the Administrator now enters his final order in this matter without a hearing and based on the investigative file. 21 CFR. 1301.57.

The Administrator finds that Dr. Zahorian's medical license was suspended by the Commonwealth of Pennsylvania, Department of State, Bureau of Professional and Occupational Affairs, State Board of Osteopathic Medicine effective January 2, 1992. This suspension was based upon felony convictions in the United States District Court for the Middle District of Pennsylvania of four (4) counts of intentionally and knowingly distributing controlled substances, to-wit: Tylenol with codeine #3, Tylenol with codeine #4, Valium and Vicodin. Consequently, Dr. Zahorian is no longer authorized to prescribe, dispense, administer or otherwise handle controlled substances in any schedule in the Commonwealth of Pennsylvania.

The Administrator concludes that the DEA does not have the statutory authority under the Controlled Substances Act to issue or maintain a registration if the applicant or registrant is without state authority to handle controlled substances. See 21 U.S.C. 823(f). The Administrator and his predecessors have consistently so held. See Howard J.Reuben, M.D., 52 FR 8375 (1987); Ramon Pla, M.D., Docket No. 86-54, 51 FR 41168 (1986); Dale D. Shahan, D.D.S., Docket No. 85-57, 51 FR 23481 (1986); and cases cited therein. Since Dr. Zahorian lacks state authorization to handle controlled substances, it is not necessary for the Administrator to decide the issue of whether Dr. Zahorian's continued registration is inconsistent with the public interest at this time or whether his registration should be revoked based upon the aforementioned felony convictions in the United States District Court for the Middle District of Pennsylvania.

No evidence of explanation or mitigating circumstances has been offered by Dr. Zahorian. Therefore, the Administrator concludes that Dr. Zahorian's DEA Certificate of Registration must be revoked.

Accordingtly, the Administrator of the Drug Enforcement Administration, pursuant to the authority vested in him by 21 U.S.C. 823 and 824 and 28 CFR 0.100(b), hereby orders that DEA Certificate of Registration, AZ7037004, previously issued to George T. Zahorian, III, D.O., be, and it hereby is, revoked, and any pending applications for the

renewal of such registration, be, and they hereby are, denied. This order is effective June 12, 1992.

Dated: June 8, 1992.

Robert C. Bonner,

Administrator of Drug Enforcement.

BILLING CODE 4410-09-M

DEPARTMENT OF LABOR

Labor Advisory Committee for Trade Negotiations and Trade Policy; Meeting

Pursusnt to the provisions of the Federal Advisory Committee Act (Pub. L. 92–463 as amended), notice is hereby given of a meeting of the Labor Advisory Committee for Trade Negotiations and Trade Policy.

Date, time and place; July 8, 1992, 10 a.m.– 12 noon, rm. S–4215 A&B, Department of Labor Building. 200 Constitution Avenue, NW., Washington, DC 20210.

Purpose: To discuss trade negotiations and trade policy of the United States.

This meeting will be closed under the authority of section 10(d) of the Federal Advisory Committee Act and 5 U.S.C. 552(c)(1). The Committee will hear and discuss sensitive and confidential matters concerning U.S. trade negotiations and trade policy.

For further information, contact: Fernand Lavallee, Director, Trade Advisory Group, Phone: (202) 523–2752.

Signed at Washington, DC this 5th day of June 1992.

Robert Bostick,

Acting Deputy Under Secretary, International Affairs.

[FR Doc. 92-13878 Filed 6-11-92; 8:45 am] BILLING CODE 4510-28-M

Employment Standards Administration Wage and Hour Division

Minimum Wages for Federal and Federally Assisted Construction; General Wage Determination Decisions

General wage determination decisions of the Secretary of Labor are issued in accordance with applicable law and are based on the information obtained by the Department of Labor from its study of local wage conditions and data made available from other sources. They specify the basic hourly wage rates and fringe benefits which are determined to be prevailing for the described classes of laborers and mechanics employed on construction projects of a similar character and in the localities specified therein.

The determinations in these decisions of prevailing rates and fringe benefits have been made in accordance with 29 CFR part 1, by authority of the Secretary of Labor pursuant to the provisions of the Davis-Bacon Act of March 3, 1931, as amended (46 Stat. 1494, as amended, 40 U.S.C. 276a) and of other Federal statutes referred to in 29 CFR part 1, appendix, as well as such additional statutes as may from time to time be enacted containing provisions for the payment of wages determined to be prevailing by the Secretary of Labor in accordance with the Davis-Bacon Act. The prevailing rates and fringe benefits determined in these decisions shall, in accordance with the provisions of the foregoing statutes, constitute the minimum wages payable on Federal and federally assisted construction projects to laborers and mechanics of the specified classes engaged on contract work of the character and in the localities described therein.

Good cause is hereby found for not utilizing notice and public comment procedure thereon prior to the issuance of these determinations as prescribed in 5 U.S.C. 553 and not providing for delay in the effective date as prescribed in that section, because the necessity to issue current construction industry wage determinations frequently and in large volume causes procedures to be impractical and contrary to the public interest.

General wage determination decisions, and modifications and supersedeas decisions thereto, contain no expiration dates and are effective from their date of notice in the Federal Register, or on the date written notice is received by the agency, whichever is earlier. These decisions are to be used in accordance with the provisions of 29 CFR parts 1 and 5. Accordingly, the applicable decision, together with any modifications issued, must be made a part of every contract for performance of the described work within the geographic area indicated as required by an applicable Federal prevailing wage law and 29 CFR part 5. The wage rates and fringe benefits, notice of which is published herein, and which are contained in the Government Printing Office (GPO) document entitled "General Wage Determination's Issued Under The Davis-Bacon And Related Acts," shall be the minimum paid by contractors and subcontractors to

laborers and mechanics.

Any person, organization, or governmental agency having an interest in the rates determined as prevailing is encouraged to submit wage rate and fringe benefit information for consideration by the Department.

Further information and selfexplanatory forms for the purpose of submitting this data may be obtained by writing to the U.S. Department of Labor, Employment Standards Administration, Wage and Hour Division, Division of Wage Determinations, 200 Constitution Avenue, NW., room S-3014, Washington, DC 20210.

New General Wage Determination Decisions

The numbers of the decisions added to the Government Printing Office document entitled "General Wage Determinations Issued Under the Davis-Bacon and Related Acts" are listed by Volume, State, and page numbers(s).

General Wage Determination Publication

General wage determinations issued under the Davis-Bacon and related Acts, including those noted above, may be found in the Government Printing Office (GPO) document entitled "General

Wage Determinations Issued Under the Davis-Bacon And Related Acts". This publication is available at each of the 50 Regional Government Depository Libraries and many of the 1,400 Government Depository Libraries across the county. Subscriptions may be purchased from:

Superintendent of Documents U.S. Government Printing Office Washington, DC 20402 (202) 763–3238

When ordering subscription(s), be sure to specify the State(s) of interest, since subscriptions may be ordered for any or all of the three separate volumes, arranged by State. Subscriptions include an annual edition (issued on or about January 1) which includes all current general wage determinations for the States covered by each volume. Throughout the remainder of the year, regular weekly updates will be distributed to subscribers.

Signed at Washington, DC this 5th Day of June 1992.

Alan L. Moss,

Director, Division of Wage Determinations. [FR Doc. 92–13674 Filed 6–11–92; 8:45 am] BILLING CODE 4510-27-M

Employment and Training Administration

Determinations Regarding Eligibility To Apply for Worker Adjustment Assistance

In accordance with section 223 of the Trade Act of 1974 (19 U.S.C. 2273) the Department of Labor herein presents summaries of determinations regarding eligibility to apply for adjustment assistance issued during the period of May 1992.

In order for an affirmative determination to be made and a certification of eligibility to apply for adjustment assistance to be issued, each of the group eligibility requirements of section 222 of the Act must be met.

- (1) That a significant number or proportion of the workers in the workers' firm, or an appropriate subdivision thereof, have become totally or partially separated,
- (2) That sales or production, or both, of the firm or subdivision have decreased absolutely, and
- (3) That increases of imports of articles like or directly competitive with articles produced by the firm or appropriate subdivision have contributed importantly to the separations, or threat thereof, and to the absolute decline in sales or production.

Negative Determinations

In each of the following cases the investigation revealed that criterion (3) has not been met. A survey of customers indicated that increased imports did not contribute importantly to worker separations at the firm.

- TA-W-27,065; Chromalloy Technologies Turbine Engine Support (TES) Div., Essexville, MI
- TA-W-26,946; National Semiconductor Corp., South Portland, ME
- TA-W-26,980; Moog, Inc., East Aurora, NY
- TA-W-27,063; Ruffin Drilling Co., Roswell, NM

In the following cases, the investigation revealed that the criteria for eligibility has not been met for the reasons specified.

TA-W-27,142; Garlington Trucking, Inc., Bloomfield, NM

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,020; Oilfield Testers, Inc., Morgan City, LA

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,040; Vector Seismic Data Processing, Inc., Denver, CO

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,057; Petroleum Management, Inc., Corpus Christi, TX

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,004; Luebke Corp., Brookfield, WI

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,080; TA-W-27,081; Oiltech Associated Services & Integrated Supplies, Inc., Oilfield Distribution Co., Houston, TX and Oilfield Distribution Co., Inc., Beeville, TX

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,076; Salant Corp., New York, NY

Increased imports did not contribute importantly to worker separations at the firm.

TA-W-27,059; & TA-W-27,060; Triangle Wire and Cable, Edison, NJ and New Brunswick, NJ

U.S. imports of electric wire and cable decreased absolutely in 1991.

TA-W-27,029; Joe N. Van Auken, CBL, Inc., Oklahoma City, OK

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,032; Tesoro Petroleum Corp., Headquarters, San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,033; Tesoro Alaska Petroleum Co., San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,034; Tesoro Refining, Marketing & Crude Supply Co., San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,035; Interior Fuels, San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,036; Tesoro Northstore Co., San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,037; Tesoro Petroleum Distributing Co., San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the

relevant period as required for certification.

TA-W-27,038; Tesoro Exploration & Production Co., San Antonio, TX

The investigation revealed that criterion (2) has not been met. Sales or production did not decline during the relevant period as required for certification.

TA-W-27,078; Columbia Gas Development Corp., Houston, TX

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,107; KP Exploration, Inc., Houston, TX

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

TA-W-27,091; Phillips Petroleum Co., Bartlesville, OK

The workers' firm does not produce an article as required for certification under section 222 of the Trade Act of 1974.

[TA-W-26,858]

Ensco, Inc., Ensco Drilling Co., Broussard, LA; Amended Certification Regarding Eligibility To Apply for Worker Adjustment Assistance

In accordance with section 223 of the Trade Act of 1974 (19 U.S.C. 2273) the Department of Labor issued a Certification of Eligibility to Apply for Worker Adjustment Assistance on May 6, 1992, applicable to the workers at the subject firm. The certification notice was published in the Federal Register on May 22, 1992 (57 FR 21828).

May 22, 1992 (57 FR 21828).

At the request of the Texas and
Louisiana State Agencies, the
Department reviewed the certification
for workers of Ensco Drilling Company

in Broussard, Louisiana. The investigation findings show that the Ensco Drilling Company claimants' wages are being reported under Ensco, Inc., in Dallas, Texas. Accordingly, the Department is correcting the certification to properly reflect the correct worker group.

The amended notice applicable to TA-W-26,858 is hereby issued as follows:

All workers of Ensco Drilling Company, Broussard, Louisiana, a subsidiary of Ensco, Inc., who became totally or partially separated from employment on or after February 1, 1991 are eligible to apply for adjustment assistance under Section 223 of the Trade Act of 1974.

Signed in Washington, DC, this 5th day of June 1992.

Marvin M. Fooks,

Director, Office of Trade Adjustment Assistance.

[FR Doc. 93-13880 Filed 6-11-92; 8:45 am] BILLING CODE 4510-30-M

[TA-W-26,970]

Freeport-McMoran Inc., Freeport-McMoran Oil & Gas Co., New Orleans, LA; Amended Certification Regarding Eligibility To Apply for Worker Adjustment Assistance

In accordance with Section 223 of the Trade Act of 1974 (19 U.S.C. 2273) the Department of Labor issued a Certification of Eligibility to Apply for Worker Adjustment Assistance on May 8, 1992, applicable to the workers at the subject firm. The certification notice was published in the Federal Register on May 28, 1992 (57 FR 22493).

At the request of the Texas and Louisiana State Agencies the Department reviewed the certification for workers of Freeport-McMoran Oil & Gas Company in New Orleans, Louisiana. The investigation findings show that Freeport-McMoran Oil & Gas Company claimants wages are being reported under Freeport-McMoran, Inc. Accordingly, the Department is correcting the certification to properly reflect the correct worker group.

The amended notice applicable to TA-W-26,970 is hereby issued as follows:

All workers of Freeport-McMoran Oil & Gas Company, New Orleans, Louisiana, a subsidiary of Freeport-McMoran, Inc. who became totally or partially separated from employment on or after February 24, 1991 are eligible to apply for adjustment assistance under section 223 of the Trade Act of 1974.

Signed in Washington, DC, this 4th day of June 1992.

Marvin M. Fooks,

Director, Office of Trade Adjustment Assistance.

[TA-W-26, 861]

Gerber Childrenswear, Inc., Pelzer, SC; Revised Determination on Reconsideration

On June 2, 1992, the Department issued an Affirmative Determination Regarding Application for Reconsideration for former workers engaged in employment related to the production of diapers at the subject firm. This notice will soon be published in the Federal Register.

A company official claimed that the closing down of the weaving operations for diapers at Pelzer was the direct result of the company purchasing imported woven fabric for cloth diapers

from offshore suppliers.

Investigation findings show that the subject plant produced all of its woven diaper fabric 1991. The findings also show that worker separations in the cloth weaving operation for diapers began in early 1991 and all production related to cloth weaving at Pelzer ceased on March 31, 1992.

On reconsideration, new information was obtained showing that Gerber Childrenswear made the decision to import woven diaper fabric in January, 1992 and that the company is currently importing woven diaper fabric from offshore suppliers.

Company imports of woven diaper fabric have adversely affected the preweaving operations of opening, picking, carding, roving, spinning, spooling, warping and bleaching of the diaper yarn at Pelzer, South Carolina.

Conclusion

After careful consideration of the new facts obtained on reconsideration, it is concluded that Gerber Childrenswear's workers in Pelzer, South Carolina were adversely affected by increased imports of articles like or directly competitive with woven cloth diaper material produced at Gerber Childrenswear Pelzer, South Carolina. In accordance with the provisions of the Act, I make the following revised certification for the Gerber Childrenswear workers in Pelzer, South Carolina.

All workers of Gerber Childrenswear, Inc., in Pelzer, South Carolina who became totally or partially separated from employment on or after February 7, 1991 and before June 1, 1992 are eligible to apply for adjustment assistance under section 223 of the Trade Act of 1974.

Signed at Washington, DC, this 4th day of June 1992.

Robert O. Deslongchamps,

Director, Office of Legislation of Actuarial Services, Unemployment Insurance Service. [FR Doc. 92–13882 Filed 6–11–92; 8:45 am] BILLING CODE 4510-30-M

[TA-W-25, 501]

Komatsu Dresser, Inc., Galion, OH; Negative Determination on Remand

By order dated April 24, 1992, the United States Court of International Trade (USCIT) in Former Employees of Komatsu Dresser v. Secretary of Labor (USCIT) (91–08–00559) remanded this case to the Department for further investigation.

The initial investigation found that the workers at Komatsu Dresser in Galion produce construction machinery—compactors (rollers) cranes, graders, excavators, planners and hydraulic cylinders. Further, sales and production of all products increased in fiscal year (FY) 1990 compared to FY 1989 at Galion except for rollers and graders.

The Department's negative determination was based on the fact that the "contributed importantly" test of the Group Eligibility Requirements of the Trade Act was not met. The "contributed importantly" test is generally demonstrated through a survey of the workers' firm's customers. The Department's survey of Komatsu's major customers showed that they did not import rollers or graders in 1989 or in 1990.

On remand, the Department contacted the petitioning union official for more information on the imported components which the former workers allege to have caused the worker separations at Galion. The union official responded that he didn't have any more information at this time.

Findings on remand show that the components (moldboards, tandem mounting sleeves, final drive housings, axle weldments, sprockets and excavator parts) are used internally for assembly of construction equipment at Galion and do not have a market outside the plant.

There were no significant imports of components previously produced at Galion during the investigation period. The remand findings further show that moldboards, tandem mounting sleeves and final drive housings, all motor grader components, were outsourced to

domestic or foreign vendors after the Department's negative determination. Axle weldments had been outsourced to Brazil in 1985 but in 1991, during the investigation period, Galion resumed axle weldment production again. The few axle weldments purchased from Brazil in 1991 did not cause any worker separations at Galion. In fact, the resumption of axle weldment production at Galion created more work at the Galion plant.

Excavator parts and sprockets have always been purchased items for the Galion plant and were not made in Galion during the relevant period. Hydraulic cylinders, less than five percent of Galion's sales, were produced mainly for export to Canada.

The union's submission to the USCIT shows invoices and memos on component imports dated, for the most part, after the Department's investigation and negative decision, e.g., the invoices from CGL Manufacturing in Guelph, Ontario (October 6, 1991) and Canada Ingot Mould (August 1991); fax letters from Norinco in China (May 30, 1991 and May 28, 1991); Komatsu inter office memos (May 14, 1991 and May 20, 1991) and a Komatsu letter to NIC International Trade Corporation (May 31, 1991).

Those invoices dated within the time period of the Department's investigation involve component parts that were not produced at Galion and were purchased from either Japan or Brazil—e.g., the January 22, 1991 invoice for excavator components from Japan and a packing list dated October 19, 1990 from Komatsu in Brazil showing shipments of axle weldments whose production had resumed at Galion in 1991, and sprockets. None of the invoices concern components that were previously produced at Galion.

The findings show that imports of moldboards, tandem mounting sleeves and final drive housings occurred after the Department's investigation. Even if the imports occurred during the investigation period, the number of worker separations from outsourcing was not significant, (Suppl. Rec. p. 3).

If imports of components are now causing significant worker separations, then the Department would entertain a new petition from the adversely affected workers.

Other findings or remand from the company and its customers reveal that demand for construction machinery has been weak for the past two years because of the recession and the credit crunch resulting from the S&L debacle.

Conclusion

After reconsideration, I affirm the original notice of negative determination to apply for adjustment assistance to former workers of Komatsu Dresser, Inc., in Galion, Ohio.

Signed at Washington, DC, this 5th day of June 1992.

Stephen A. Wandner,

Deputy Director, Office of Legislation & Actuarial Services, Unemployment Insurance Service.

[FR Doc. 92-13883 Filed 6-11-92; 8:45 am] BILLING CODE 4510-30-M

Investigations Regarding Certifications of Eligibility To Apply for Worker Adjustment Assistance

Petitions have been filed with the Secretary of Labor under section 221(a) of the Trade Act of 1974 ("the Act") and are identified in the Appendix to this notice. Upon receipt of these petitions, the Director of the Office of Trade Adjustment Assistance, Employment and Training Administration, has instituted investigations pursuant to section 221(a) of the Act.

The purpose of each of the investigations is to determine whether the workers are eligible to apply for adjustment assistance under title II, chapter 2, of the Act. The investigations will further relate, as appropriate, to the determination of the date on which total or partial separations began or threatened to begin and the subdivision of the firm involved.

The petitioners or any other persons showing a substantial interest in the subject matter of the investigations may request a public hearing, provided such request is filed in writing with the Director, Office of Trade Adjustment Assistance, at the address shown below, not later than June 22, 1992.

Interested persons are invited to submit written comments regarding the subject matter of the investigations to the Director, Office of Trade Adjustment Assistance, at the address shown below, not later than June 22, 1992.

The petitions filed in this case are available for inspection at the Office of the Director, Office of Trade Adjustment Assistance, Employment and Training Administration, U.S. Department of Labor, 200 Constitution Avenue, NW., Washington, DC 20210.

Signed at Washington, DC this 1st day of June 1992.

Marvin M. Fooks,

Director, Office of Trade Adjustment Assistance.

In accordance with the Paperwork Reduction Act and OMB Guidelines, the National Science Foundation is posting two notices of information collections that will affect the public. Interested persons are invited to submit comments by June 30, 1992. Comments may be submitted to:

(A) Agency Clearance Officer. Herman G. Fleming, Division of Personnel and Management, National Science Foundation, Washington, DC 20550, or by telephone (202) 357–7335, and to:

(b) OMB Desk Officer. Office of Information and Regulatory Affairs, Attn: Dan Chenok, Desk Officer, OMB, 722 Jackson Place, room 3208, NEOB, Washington, DC 20503.

Title: Higher Education Survey #18, Survey on Alcohol and Drug Programs at Higher Education Institutions.

Affected Public: Non-Profit Institutions.

Respondents/Reporting Burden: 567 respondents, One hour per response.

Abstract: This and other HES panel surveys are responsible for a variety of policy issues. This survey measures to the extent to which insitutions have implemented new or strengthened existing prevention policies and prevention programs in response to the Drug Free School and Community Act Amendments of 1989.

Dated: June 9, 1992.

Herman G. Fleming,

NSF Reports Clearance Officer.

BILLING CODE 7555–01–M

NUCLEAR REGULATORY COMMISSION

Documents Containing Reporting or Recordkeeping Requirements; Office of Management and Budget Review

AGENCY: U.S. Nuclear Regulatory Commission.

ACTION: Notice of the Office of Management and Budget review of information collection.

SUMMARY: The Nuclear Regulatory Commission (NRC) has recently submitted to the Office of Management and Budget (OMB) for review the following proposal for the collection of information under the provisions of the Paperwork Reduction Act (44 U.S.C. chapter 35).

1. Type of submission, new, revision, or extension: Revision.

2. The title of information collection: Elimination of Record Keeping Requirements Associated with the Interim Final Rule, 10 CFR parts 30 and 35.

The form number if applicable: Not applicable.

4. How often the collection is required: This rulemaking proposes to

eliminate the recordkeeping requirements previously approved for documenting departures from the elution and preparation instructions for diagnostic radiopharmaceuticals or from the package insert instructions regarding use or route of administration for therapeutic radiopharmaceuticals..

5. Who will be required or asked to report: This rulemaking would eliminate the recordkeeping burden for medical use and commercial nuclear pharmacy material licensees who make departures from the preparation and elution instructions for diagnostic radiopharmaceuticals or from the package insert instructions regarding indications for use or route of administration for therapeutic radiopharmaceuticals.

6. Estimate of the number of responses: Each departure is a response. It is estimated that annually this rulemaking would eliminate the recordkeeping burden for 23,000 diagnostic radiopharmaceuticals departures and 100 therapeutic radiopharmaceutical departures...

7. An estimate of the total number of hours needed to complete the requirement or request: The average burden reduction per response is: An estimated 6 minutes for each medical use licensee that elutes generators and prepares diagnostic radiopharmaceuticals when making the original written directive for a specific departure; 3 minutes for each medical use licensee that elutes generators and prepares diagnostic radiopharmaceuticals, when making a departure, when the directive references the original written directive; 5 minutes for each medical use licensee that orders its diagnostic radiopharmaceuticals from a commercial nuclear pharmacy when making the original written directive for a specific departure; 1 minute for each medical use licensee that orders its diagnostic radiopharmaceuticals from a commercial nuclear pharmacy when making a departure for subsequent departures, which references the original written directive; 1 minute for commercial nuclear pharmacy licensees; and 6 minutes for medical use licensees using therapeutic radiopharmaceuticals. The total annual burden reduction for the industry is 1,058 hours for the diagnostic radiopharmaceuticals and 10 hours for therapeutic

radiopharmaceuticals.
8. An indication of whether section 3504(h), Public Law 96–511 applies:
Applicable.

9. Abstract: The proposed rule amends 10 CFR part 30.34, 35.200, and 35.300 to eliminate the recordkeeping requirements that document medical use or commercial nuclear pharmacy licensees' departure from the manufacturers' instructions for preparation of diagnostic radiopharmaceuticals using generators and reagent kits, or medical use licensees' departure from the package insert instruction regarding indications for use or route of administration when a written directive is made for the departure by a physician-authorized user.

Copies of the submittal may be inspected or obtained for a fee from the NRC Public Document Room, 2120 L Street NW., Lower Level, Washington, DC.

Comments and questions can be directed by mail to the OMB reviewer: Ronald Minsk, Paperwork Reduction Project (3150–0010 and 0017), Office of Management and Budget, Washington, DC 20503.

Comments can also be communicated to OMB by telephone at (202) 395–3085. The NRC Clearance Officer is Brenda Jo. Shelton, (301) 492–8132. Dated at Bethesda, Maryland, this 4th day of June 1992.

For the U.S. Nuclear Regulatory Commission.

George H. Messenger,

Acting Designated Senior Official for Information Resources Management.

[FR Doc. 92–13896 Filed 6–11–92; 8:45 am]
BILLING CODE 7590–01–M

Nomination of New Members of the Advisory Committee on the Medical Uses of Isotopes

AGENCY: U.S. Nuclear Regulatory Commission.

ACTION: Call for nominations.

SUMMARY: The U.S. Nuclear Regulatory Commission (NRC) is inviting nominations of individuals for its Advisory Committee on the Medical Uses of Isotopes (ACMUI) who are qualified in the following areas: Medical research, hospital administration, radiation oncology, nuclear cardiology, medical physics, and radiopharmacy.

DATES: Nominations are due on or before August 11, 1992.

ADDRESSES: Submit nominations to: Secretary of the Commission, ATTN: Advisory Committee Management Officer, U.S. Nuclear Regulatory Commission, Washington, DC 20555.

FOR FURTHER INFORMATION CONTACT: Larry W. Camper, Office of Nuclear Material Safety and Safeguards, U.S. Nuclear Regulatory Commission, Washington, DC 20555, telephone: 301-504-3417.

SUPPLEMENTARY INFORMATION: The ACMUI advises NRC on policy and technical issues that arise in regulating the medical use of byproduct material for diagnosis and therapy.

Responsibilities include providing guidance and comments on changes in NRC rules, regulations, and guides concerning medical use; evaluating certain non-routine uses of byproduct material for medical use; and providing technical assistance in licensing, inspection, and enforcement cases.

Committee member possess the medical and technical skills needed to address evolving issues. The ACMUI currently consists of two physician specialists in therapeutic radiology, with experience in teletherapy and brachytherapy; three physician specialists in nuclear medicine, with backgrounds in radiology, internal medicine, and cardiology; a nuclear medicine technologist; a radiopharmacist; two specialists in medical physics; a patient's rights and care advocate; an individual with experience in State regulation of radioisotopes; and a representative from the Food and Drug Administration. Because issues in the medical use of byproduct material are becoming increasingly complex, NRC has chosen to expand the ACMUI to include individuals who can provide NRC with a broader base of information and advice on complex regulatory issues affecting the medical uses of byproduct radioactive materials.

NRC is soliciting nominations of persons who are qualified in the following areas: Medical research, with expertise in the medical use of monoclonal antibodies; hospital administration or management; radiation oncology with experience in teletherapy, brachytherapy, and/or stereotactic radiotherapy; radiopharmacy; nuclear cardiology; and medical physics. Persons having the aforementioned qualifications are encouraged to apply.

All new committee members will serve a 2 year term, with possible reappointment to two additional 2-year terms.

Nominees must include resumes describing their educational and professional qualifications, and provide their current addresses and telephone numbers.

Nominees must be United States citizens and be able to devote approximately 80 hours per year to committee business. Members will be compensated and reimbursed for travel

(including per diem in lieu of subsistence), secretarial, and correspondence expenses.

Dated: Rockville, MD this 8th day of June, 1992.

For the Nuclear Regulatory Commission. John C. Hoyle,

Advisory Committee Management Officer. [FR Doc. 92–13895 Filed 6–11–92; 8:45 am] BILLING CODE 7590-01-M

[Docket No. 30-06402; License No. 42-02964-01 EA 91-121]

Western Atlas International, Inc., Houston, TX; Order Imposing Civil Monetary Penalty

1

Western Atlas International, Inc. (Licensee) is the holder of Materials License No. 42–02964–01 issued by the Nuclear Regulatory Commission (NRC or Commission). The license authorizes the Licensee to possess a variety of radioactive byproduct materials for use in well tracer studies and well logging activities in accordance with the conditions specified therein.

II

An inspection of the Licensee's activities was conducted on September 6-7 and September 11, 1991, to review the circumstances surrounding a September 5, 1991 incident involving the loss of a cesium-137 sealed source being transported with other sources from Yukon, Oklahoma to Houston, Texas. The results of this inspection indicated that the Licensee had not conducted its activities in full compliance with NRC requirements. A written Notice of Violation and Proposed Imposition of Civil Penalty (Notice) was served upon the Licensee by letter dated December 20, 1991. The Notice stated the nature of the violations, the provisions of the NRC's requirements that the Licensee had violated, and the amount of the civil penalty proposed for the violations. The Licensee responded to the Notice in letters dated January 24, 1992. In response, the Licensee admitted the violations that resulted in the proposed civil penalty, but requested mitigation of the penalty.

III

After consideration of the Licensee's response and the statements of fact, explanation, and argument for mitigation contained therein, the NRC Staff has determined, as set forth in the Appendix to this Order, that the violations occurred as stated and that the \$10,000 penalty proposed for the

violations designated in the Notice should be imposed.

In view of the foregoing and pursuant to Section 234 of the Atomic Energy Act of 1954, as amended (Act), 42 U.S.C. 2282, and 10 CFR 2.205, It Is Hereby Ordered That:

The Licensee pay a civil penalty in the amount of \$10,000 within 30 days of the date of this Order, by check, draft, or money order, or electronic transfer, payable to the Treasurer of the United States and mailed to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, Attn: Document Control Desk, Washington, DC 20555.

The Licensee may request a hearing within 30 days of the date of this Order. A request for a hearing should be clearly marked as a "Request for an Enforcement Hearing" and shall be addressed to the Director, Office of Enforcement, U.S. Nuclear Regulatory Commission, ATTN: Document Control Desk, Washington, DC 20555. Copies also shall be sent to the Assistant General Counsel for Hearings and Enforcement at the same address and to the Regional Administrator, NRC Region IV, 611 Ryan Plaza Drive, suite 400, Arlington, Texas 76011.

If a hearing is requested, the Commission will issue an Order designating the time and place of the hearing. If the Licensee fails to request a hearing within 30 days of the date of this Order, the provisions of this Order shall be effective without further proceedings. If payment has not been made by that time, the matter may be referred to the Attorney General for collection.

In the event the Licensee requests a hearing as provided above, the issues to be considered at such hearing shall be: Whether on the basis of the violations, which were admitted by the Licensee, this Order should be sustained.

Dated at Rockville, Maryland this 5th day of June 1992.

For the Nuclear Regulatory Commission. Hugh L. Thompson, Jr.,

Deputy Executive Director for Nuclear Materials Safety, Safeguards and Operations Support.

Appendix—Evaluation and Conclusions

On December 20, 1991, a Notice of Violation and Proposed Imposition of Civil Penalty (Notice) was issued for violations identified during an NRC inspection. Western Atlas International, Inc. (WAII or Licensee) responded to the Notice on January 24, 1992. The Licensee admitted the violations which resulted in the proposed civil penalty but requested mitigation of the penalty. The

NRC's evaluation and conclusions regarding the Licensee's requests are as follows:

Restatement of Violations (Part I of Notice, Violations Assessed a Civil Penalty)

A. 10 CFR 71.5(a) requires that each licensee who transports licensed radioactive material outside of the confines of its plant or other place of use, or who delivers licensed material to a carrier for transport, shall comply with the applicable requirements of the regulations appropriate to the mode of transport of the United States Department of Transportation (DOT) in 49 CFR parts 170 through 189.

49 CFR 177.842(d) requires that packages of radioactive material must be so blocked and braced that they cannot change position during conditions normally incident to

transportation.

Contrary to the above, on September 5. 1991, the licensee did not adequately block and brace a package containing licensed material to prevent the movement and subsequent accidental loss of that package from the transport vehicle. Specifically, a transport package containing a two curie cesium 137 sealed source was not sufficiently blocked and braced on the transport vehicle to prevent the accidental loss of the package under conditions normally incident to transportation while en route from Yukon. Oklahoma to Houston, Texas.

B. 10 CFR 71.5(a) requires that each licensee who transports licensed radioactive material outside of the confines of its plant or other place of use, or who delivers licensed material to a carrier for transport, shall comply with the applicable requirements of the regulations appropriate to the mode of transport of the United States Department of Transportation (DOT) in 49 CFR parts 170 through 189.

49 CFR 173.475 requires, in part, that prior to each shipment of radioactive material, the licensee ensure that the transport package is in unimpaired condition and that each closure device is properly installed and

secured and free of defects.

Contrary to the above, on September 5, 1991, the licensee did not ensure that the transport package's closure device was properly installed and secured and free of defects. Specifically, the safety pin designed to secure the locking bar of the transportation package's closure device was not installed prior to the package's use in transporting a two curie cesium 137 sealed source. Subsequently, the closure device became dislodged during transport which allowed the sealed source to become separated from the transport package when the package was lost from the transport vehicle while en route from Yukon, Oklahoma to Houston, Texas.

Collecively, this is a Severity Level I problem. Cumulative Civil Penalty-\$10,000 (assessed equally between the two

violations).

Summary of Licensee's Response and Request for Mitigation

The Licensee admitted the violations which resulted in the proposed civil penalty but requested mitigation of the penalty from \$10,000 to either the basic \$2,000 (referring to the normal base value alluded to on Page 3 of

NRC's December 20, 1991, Notice) or to something closer to \$2,000. The Licensee based its request for mitigation on its arguments that:

(1) The amount of the civil penalty should not have been increased based on "prior notice" where the WAII Senior Safety Engineer performed an inspection in advance of the shipment of radioactive sources and instructed a district manager to take certain actions prior to shipping the sources.

(2) WAII does not need additional punishment to get its attention, as indicated by the fact that it terminated the employment of the district manager who, according to WAII, intentionally did not follow instructions which could have mitigated the consequences of the event; and by the fact that it took corrective actions to preclude recurrence, including modifications to its carrier vehicles.

(3) The penalty against WAII should reflect what actually occurred, not what could have occurred based on speculation.

(4) The penalty should reflect the past good record of WAII.

NRC Evaluation of Licensee's Response

(1) Prior Notice

NRC's December 20, 1991, letter stated . . it was determined that any mitigation based on your good past performance was offset by your prior notice regarding the defects in the shipping container's closure mechanism." NRC's Enforcement Policy (Section V.B.) permits increasing a civil penalty by as much as 100% in cases where the licensee had prior knowledge of a potential problem as a result of a licensee review, and failed to take effective corrective

WAII questions whether this factor should be applied when, as it argues in this case, an inspection is performed by the licensee in advance of an activity and responsible individuals ignore instructions to take steps to preclude violations. "It would appear," WAII said in its reply, "that the NRC prefers WAII had not made the preliminary inspection so that any loss would have been simply inadvertent or without knowledge . . . Failing to do so should be a factor which increases the penalty, not the reverse. . . ."

It is expected that licensees conduct appropriate audits to assure that regulatory requirements are being met. Licensees who fail to perform such audits do so at their peril since they risk escalated enforcement action for NRC-identified violations. Therefore, NRC does not accept the contention that licensee management will not conduct audits to identify safety issues because of fear of enforcement action. Such an attitude is inconsistent with the safety ethic expected of

The NRC Enforcement Policy provides that meticulous attention to detail is expected from licensees in order to assure adequate protection of the public health and safety. The preliminary inspection performed by the Licensee's Senior Safety Engineer exemplifies this approach. The issue in this case is not that the civil penalty is being escalated for performing an audit, but rather that the penalty is being escalated because there was

not adequate follow up by management consistent with the safety significance of the problem that the audit uncovered.

As a result of the preliminary inspection, Licensee management had knowledge of a problem with significant health and safety implications; but subsequently, the District Manager, a Licensee official, failed to address the issue. The NRC Enforcement Policy defines a "licensee official" as a first line supervisor or above. Had the failure occurred on the part of a non-management employee, the outcome of the enforcement action would have been different.

The Licensee further seeks to distance itself from the failure of its employee by stating that "specific remedial instructions were given which were ignored by a District Manager who had no history of ignoring such instructions." NRC is not in a position to comment on whether the District Manager had a history of ignoring instructions. It is not clear why, in the absence of a history of not following instructions, he would do so here. Nevertheless, the use of inadequately prepared shipping containers is a serious matter that should have had further follow up to assure that the problem was corrected. Considering that the District Manager failed to follow through by executing the instructions of the Senior Safety Engineer, and that the Senior Safety Engineer failed to follow up with the District Manager to assure that the instructions were executed, it is clear that Licensee management, with the knowledge available, could have taken reasonable action that would have prevented the violation from occurring. As a result of the failure to follow through on the part of Licensee management, a violation occurred that involved the potential for very significant radiation exposure, and one member of the public did receive an exposure to his fingers of 3.5 to 5.5 rem.

Under these circumstances, the NRC Staff believes that it acted appropriately in balancing mitigation for prior good performance (in this case, 100% mitigation) against escalation for prior notice (in this case), 100% escalation. The Licensee has provided no basis for any additional mitigation.

2. Incentives to Take Corrective Action

The Licensee argues that the civil penalty is not necessary to cause it to take its responsibilities seriously and to take corrective actions. NRC licensees are always expected to take their responsibilities seriously and take appropriate corrective action. Additional action would be taken if a licensee argued otherwise. Civil penalties are assessed to deter future noncompliance on the part of all licensees and to emphasize the need for lasting corrective action. The deterrent effect is achieved when licensees, in order to avoid civil penalties, take prompt and effective action in advance of any potential violation so that the violation does not occur and the NRC does not have to become involved. Thus, the NRC Staff does not believe that the Licensee's argument warrants reconsideration of the civil penalty.

3. Actual vs. Hypothetical Consequences

The Licensee argues that the penalty should reflect what actually occurred, not

what could have occurred. However, the NRC Enforcement Policy takes into account both actual and potential safety consequences. In this case, the NRC Staff, after consulting the Commission, assigned the highest possible severity level to the violations because they resulted in actual unnecessary radiation exposures to emergency response personnel and had a potential for much higher exposures to these individuals and to other members of the public. The regulations that were violated are designed to prevent licensed radioactive sources from posing this type of hazard. The entire system of containment-consisting of the source container itself and the securing of the container to the vehicle-failed due to these violations. As the Commission stated in X-Ray Engineering, "* * * our statutory obligation to protect the public health and safety is not subject to the condition precedent that actual injuries occur." 1 AEC 553, 555 (1960).

The Licensee also raises an issue as to whether the emergency response personnel acted reasonably and were adequately trained. However, the responsibility to adequately control licensed material so as to assure the protection of the public health and safety rests with the Licensee and not with emergency response personnel or other members of the general public. Moreover, any person could have stopped on the roadway and picked up the source. Only luck prevented that scenario, with its resulting adverse health and safety consequences, from happening.

Thus, the NRC Staff does not find that the Licensee's argument warrants reconsideration of the civil penalty.

4. Compliance History

The Licensee argues that the civil penalty should reflect the good past record of WAII. As discussed above, in proposing the penalty, NRC did take the Licensee's past performance into account and concluded that mitigation of the base penalty value was appropriate based on prior good performance. However, this mitigation was offset by the escalation of the base penalty value on the prior notice factor.

NRC Conclusion

The NRC Staff concludes that the Licensee has not provided an adequate basis for mitigation of the civil penalty. Consequently, the proposed civil penalty in the amount of \$10,000 should be imposed.

[FR Doc. 92-13897 Filed 6-11-92; 8:45 am] BILLING CODE 7590-01-M

OFFICE OF THE UNITED STATES TRADE REPRESENTATIVE

[Docket No. 301-63A]

Proposed Determination of Action Concerning the European Community's Oilseeds Subsidy Regime; Request for Public Comment and Public Hearing

AGENCY: Office of the United States Trade Representative.

ACTION: Notice of proposed determination of action pursuant to sections 301(a) and 306(b) of the Trade Act of 1974, as amended (Trade Act); request for public comment pursuant to section 306(c) of the Trade Act; and notice of public hearing concerning the proposed action.

SUMMARY: Rights and benefits of the United States under the General Agreement on Tariffs and Trade (GATT) continue to be denied by subsidies on oilseeds granted by the European Community (EC). Accordingly, the United States Trade Representative (USTR or Trade Representative) intends to take action, subject to the direction, if any, of the President, as required by section 301(a), to enforce U.S. rights or to obtain the elimination of the EC's subsidies on oilseeds. Specifically, the Trade Representative proposes to increase duties affecting \$1 billion in imports of EC goods into the United States, which is an amount equivalent in value to the burden or restriction imposed upon U.S. commerce by the EC's oilseed subsidies. The Trade Representative also seeks public comment and will hold a public hearing on July 13-14, 1992, concerning the proposed action.

DATES: Written comments from interested persons are due on or before July 10, 1992; requests to testify at the public hearings are due on or before June 24, 1992; written testimony is due on or before July 6, 1992; the public hearing will be held on July 13, 1992, and will continue on July 14, 1992, if necessary; and rebuttal briefs are due on or before July 17, 1992.

FOR FURTHER INFORMATION CONTACT: Marilyn Moore, Senior Economist (202) 395–5006; Bennett Harman, Director for European Community Affairs (202) 395– 3074; or Daniel Brinza, Senior Advisor and Special Counsel for Natural Resources (202) 395–7305, Office of the United States Trade Representative.

SUPPLEMENTARY INFORMATION: On December 16, 1987, the American Soybean Association filed a petition pursuant to section 302 of the Trade Act alleging, among other things, that the EC's acts, policies, and practices concerning oilseeds were denying rights of the United States under the GATT and were imposing a burden or restriction upon U.S. commerce. On January 5, 1988, the Trade Representative initiated in investigation of these practices.

After extensive consultations failed to resolve the dispute, the United States requested the GATT Council of Representatives (GATT Council) to establish a dispute settlement panel, in accordance with section 303(a)(2) of the Trade Act. The GATT panel found in 1989 that EC subsidies to oilseed producers and processors deny U.S. exporters the benefits of duty-free access to the EC market that were guaranteed to the United States in a 1962 trade agreement.

On January 25, 1990, the GATT
Council adopted the panel report by
consensus, and the EC representative
confirmed the EC's intention to comply
with the panel's recommendations. The
EC advised that the necessary measures
would be effective by the 1991 crop

year

On January 31, 1990, USTR determined, consistent with the GATT panel's conclusions, that the EC's production and processing subsidies on oilseeds deny rights of the United States under a trade agreement within the meaning of section 301(a)(1)(A) of the Trade Act, and that EC production subsidies deny benefits to the United States within the meaning of section 301(a)(1)(B)(i). Because the EC had agreed to take satisfactory measures within the meaning of section 301(a)(2)(B)(i) to comply with its GATT obligations, USTR determined pursuant to section 304(a)(1)(B) that the appropriate action at that time was to conclude the investigation, monitor the EC's compliance pursuant to section 306(a), and take further action if the EC failed to implement the panel report satisfactorily by the 1991 crop year.

On May 24, 1991, the EC advised that it would implement the GATT panel's recommendations by October 31, 1991, and that the reforms would apply to all oilseeds harvested during calendar year 1992 and thereafter. The EC proposed a new subsidies regime that purported to comply with the GATT panel's

recommendations.

After reviewing the new regime, the United States proposed that the GATT panel be reconvened to consider whether the EC had implemented the panel's findings. On March 16, 1992, the reconvened panel formally released its "follow-up" report, which confirmed that the EC is continuing to impair its duty-free tariff bindings on oilseeds. The reconvened panel recommended that the EC move expeditiously to modify its new support system. At the GATT Council meeting on April 30, 1992, the EC indicated that it is not now prepared to make the required changes.

Proposed Determination and Action

If, on the basis of monitoring, the Trade Representative considers that the

EC is not satisfactorily implementing its commitment to comply with the panel's recommendations, section 306(b) of the Trade Act requires the Trade Representative to determine what further action the Trade Representative shall take under section 301(a). Section 301(a) requires the Trade Representative to take action, subject to the specific direction, if any, of the President, to enforce U.S. GATT rights or to obtain the elimination of the act, policy, or practice at issue. Section 301(c) specifically authorizes the Trade Representative to suspend or withdraw the benefits of trade agreement concessions and to impose duties or other import restrictions upon the products of a foreign country for such time as the Trade Representative determines appropriate.

The USTR considers that the EC has failed to implement satisfactorily its commitment to comply with the original GATT panel report or to take any steps to implement the recommendations contained in the panel's "follow-up" report. Accordingly, the Trade Representative proposes, pursuant to sections 301(a) and 301(c), to impose increased duties affecting \$1 billion of EC imports into the United States, which is an amount equivalent to the burden or restriction imposed upon U.S. commerce by the EC's oilseed subsidies. The products upon which the increased duties will be imposed will be drawn from the list of products set forth in the

Annex to this notice.

Public Comment

USTR invites all interested persons to provide written comments concerning the proposed action. Specifically, interested persons may provide comments regarding (1) the appropriateness of imposing increased duties upon the products listed in the Annex to this notice; (2) the levels at which U.S. customs duties should be set for particular items; and (3) the degree to which increased duties might have an adverse effect upon U.S. consumers of the products listed in the Annex.

Comments must be filed in accordance with the requirements set forth in 15 CFR 2006.8(b), and are due no later than July 10, 1992. Comments must be in English and provided in 20 copies to: Chairman, Section 301 Committee, room 223, Office of the United States Trade Representative, 600 17th Street, NW., Washington, DC 20506.

Comments will be placed in a file (Docket 301-63A) open to public inspection pursuant to 15 CFR 2006.13, except for confidential business information exempt from public

inspection in accordance with 15 CFR 2006.15. Confidential business information submitted in accordance with 15 CFR 2006.15 must be clearly marked "Business Confidential" in a contrasting color ink at the top of each page on each of the 20 copies, and must be accompanied by a nonconfidential summary of the confidential information. The nonconfidential summary shall be placed in the docket that is open to public inspection.

Public Hearing

A public hearing concerning the proposed action will be held on July 13, 1992, commencing at 10 a.m. and continuing on July 14, 1992, if necessary. The hearing will be held at the International Trade Commission, Courtroom A, room 100, 500 E Street, SW., Washington, DC 20436.

Interested persons wishing to testify orally must provide a written request to do so by noon on June 24, 1992, to Chairman, Section 301 Committee, room 223, Office of the United States Trade Representative, 600 17th Street, NW., Washington, DC 20506. In their request, they must provide the following information (1) Name, address, telephone nunber, and firm or affiliation; and (2) a summary of their presentation. After consideration of a request to present oral testimony at the public hearing, the chairman will notify the applicant of the time of his or her testimony, if the request conforms to the requirements of 15 CFR 2006.8(a).

Additionally, person presenting oral testimony must submit 20 copies of their complete written testimony, in English, by noon on July 6, 1992, to the Chairman, Section 301 Committee at the address listed above. All written submissions msut be filed in accordance with 15 CFR 2006.8.

Testimony, both written and oral, shall be limited to the following subjects: (1) The appropriateness of imposing increased duties upon the products listed in the Annex to this notice; (2) the levels at which U.S. customs duties should be set for particular items; and (3) the degree to which increased duties might have an adverse effect upon U.S. consumers of the products listed in the Annex. Remarks at the hearing will be limited to five minutes.

In order to allow each party an opportunity to respond to information provided at the hearing by other parties, USTR will entertain rebuttal briefs filed

by any party, in accordance with 15 CFR 2006.8(c) by noon on July 17, 1992.
Jeanne E. Davidson,

Chairman, Section 301 Committee.

[Docket No. 301-89]

Termination of Section 302 Investigation: Intellectual Property Acts, Policies, and Practices on Taiwan, and Revocation of Priority Foreign Country Designation

AGENCY: Office of the United States Trade Representative.

ACTION: Notice of termination of investigation pursuant to section 302(b)

of the Trade Act of 1974, as amended (Trade Act); monitoring under section 306(a) of the Trade Act; and revocation of "priority foreign country" identification pursuant to section 182(c)(1)(A) of the Trade Act.

SUMMARY: Pursuant to section 304(a)(1)(A)(ii) of the Trade Act, 19 U.S.C. 2414(a)(1)(A)(ii), the United States Trade Representative (USTR) has decided that the acts, policies and practices of the authorities on Taiwan concerning the protection and enforcement of intellectual property rights are unreasonable and burden or restrict U.S. Commerce. The authorities on Taiwan, however, will take specific measures to improve the level of protection of intellectual property rights and the enforcement of those rights. Thus, pursuant to section 301(b), 19 U.S.C. 2411(b), the USTR has determined that the appropriate action in this case is to terminate the investigation and monitor implementation of these measures pursuant to section 306(a), 19 U.S.C. 2416. Because expeditious action was required in reaching an agreement to resolve the issues raised in this case, the USTR made her determinations prior to the receipt of the public comments that are to be submitted by July 6, 1992. (57 FR 23605) The USTR will review these comments upon receipt.

In view of the specific measures set forth in the Agreement, the USTR has decided to revoke the identification of Taiwan as a "priority foreign country" under section 182 of the Trade Act, 19 U.S.C. 2242.

DATES: This investigation was terminated and the identification of Taiwan as a "priority foreign country" revoked effective June 5, 1992.

FOR FURTHER INFORMATION CONTACT: Laura Kneale Anderson, Director for Taiwan (202) 395–6813; Emery Simon, Deputy Assistant USTR for Intellectual Property (202) 395–6864; or Catherine Field, Associate General Counsel (202) 395–3432, Office of the United States Trade Representative.

SUPPLEMENTARY INFORMATION: On May 29, 1992, pursuant to section 302(b)(2)(A) of the Trade Act, the USTR initiated an investigation of those acts, policies and practices of the authorities on Taiwan that were the basis for identification of Taiwan as a "priority foreign country" under section 182(a) of the Trade Act. In identifying Taiwan as a "priority foreign country," the USTR noted deficiencies in that trading partner's intellectual property acts, policies, and practices with respect to: (1) effective enforcement of intellectual property rights, in particular, the grant of effective remedies against infringement of copyright and trademarks; (2) the high level of exports worldwide of goods from Taiwan that infringe intellectual property rights; and (3) the level of protection provided under laws and agreements for owners of U.S. patents, copyrights, trade secrets, layout designs of integrated circuits, and industrial designs. The USTR has determined pursuant to section 304(a) of the Trade Act. 19 U.S.C. 2414(a), that these acts,

policies and practices are unreasonable within the meaning of section 301(d)(3)(B)(II) and burden or restrict U.S. commerce.

On June 5, 1992, representatives of the authorities on Taiwan and representatives of the authorities in the United States reached an agreement on providing improved levels of protection for patents, copyrights, trade secrets, layout designs of integrated circuits and industrial designs. The Agreement also provides detailed commitments on the enforcement of intellectual property rights, including commitments on the prevention of exports of infringing goods from Taiwan and a commitment to obtain effective remedies against infringement of intellectual property rights. Based on this Agreement to eliminate the unreasonable acts, policies, and practices, and in the expectation that the commitments contained in the Agreement will be fully implemented, the USTR has decided that the appropriate action in this case is to terminate this investigation. In addition, pursuant to section 182(c)(1)(A) of the Trade Act, the USTR has decided that the information in the Agreement warrants revocation of the identification of Taiwan as a "priority foreign country."

The USTR will monitor compliance with this trade agreement pursuant to section 306 of the Trade Act, and if, on the basis of this monitoring, the USTR considers that the authorities on Taiwan are not satisfactorily implementing the Agreement, the USTR will determine what further action to take under section 301(a) of the Trade Act.

Jeanne E. Davidson,

Chairman, Section 301 Committee.

SECURITIES AND EXCHANGE COMMISSION

[Rel. No. IC-18757; 811-2882]

Municipal Cash Reserve Management, Inc.; Application for Deregistration

June 4, 1992.

AGENCY: Securities and Exchange Commission ("SEC").

ACTION: Notice of Application for Deregistration Under the Investment Company Act of 1940 ("Act").

APPLICANT: Municipal Cash Reserve Management, Inc.

RELEVANT ACT SECTION: Section 8(f).

summary of application: Applicant seeks an order declaring that it has ceased to be an investment company.

FILING DATE: The application on Form N-8F was filed on January 14, 1992, and amended on May 13, 1992.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicant with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 pm. on June 29, 1992, and should be accompanied by proof of service on the applicant, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons may request notification of a hearing by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicant, Two World Trade Center, New York, NY 10048.

FOR FURTHER INFORMATION CONTACT: Barry A. Mendelson, Staff Attorney, at (202) 504–2284, or C. David Messman, Branch Chief, at (202) 272–3018 (Division of Investment Management, Office of Investment Company Regulation).

supplementary information: The following is a summary of the application. The complete application may be obtained for a fee at the SEC's Public Reference Branch.

Applicant's Representations

1. Applicant is an open-end diversified management investment company organized as a Maryland corporation. On November 2, 1978, applicant registered under the Act and filed a registration statement under the Securities Act of 1933. The registration statement became effective on November 2, 1979, and applicant's initial public offering commenced immediately thereafter.

2. On August 5, 1988, applicant's board of directors approved an Agreement and Plan of Reorganization ("Plan") providing for the transfer of applicant's assets to Shearson Daily Tax-Free Dividend Inc. ("Successor Fund") in exchange for shares of the Successor Fund and the assumption by the Successor Fund of certain stated liabilities of applicant. The Successor Fund's board of directors approved the Plan on July 21, 1988. On or about September 19, 1988, proxy materials relating to the Plan were mailed to applicant's shareholders, who approved the Plan at a special meeting held on November 22, 1988.

3. On December 2, 1988, pursuant to the Plan, each shareholder of applicant became a shareholder of the Successor Fund, receiving shares of that fund having an aggregate net asset value equal to the aggregate net asset value of his or her investment in applicant. The net asset value of applicant as of December 2, 1988 was \$1,184,348,846.

4. The expenses incident to the reorganization, consisting of accounting, printing, administrative, and legal expenses, totaled \$246,267.64. These expenses were borne by applicant (\$90,570.85), the Successor Fund (\$26,772.28), and Shearson Lehman Brothers Inc., applicant's investment adviser (\$128,924.51). Applicant is aware that such expenses, in the aggregate, are in excess of those incurred in most other reorganizations. Applicant represents that the primary reason for the elevated level of expenses was the number of accounts involved in the reorganization, i.e., 87,085. The amount expended, per account, in the reorganization was \$2.83. Applicant submits that, on a per account basis, the expenses incurred were not in excess of those reasonably incurred in other reorganizations.

5. Articles of Transfer were filed on December 2, 1988, and Articles of Dissolution will be filed, on behalf of applicant with the Maryland State Department of Assessments and Taxation to effect the dissolution of applicant as a Maryland corporation.

6. Applicant has no shareholders, assets, or liabilities, and is not a party to

any litigation or administrative proceeding. Applicant is not presently engaged in, nor does it propose to engage in, any business activities other than those necessary for the winding up of its affairs.

For the Commission, by the Division of Investment Management, under delegated authority.

Margaret H. McFarland,

Deputy Secretary.

[Rel. No. IC-18758; 812-7808]

PaineWebber America Fund, et al.; Notice of Application

June 4, 1992.

AGENCY: Securities and Exchange Commission ("SEC").

ACTION: Notice of Application for Exemption under the Investment Company Act of 1940 (the "Act").

APPLICANTS: PaineWebber America Fund, PaineWebber Atlas Fund, PaineWebber Mutual Fund Trust, PaineWebber Regional Financial Growth Fund, Inc., PaineWebber Managed Investments Trust. PaineWebber Investment Series. PaineWebber Managed Assets Trust, PaineWebber Managed Municipal Trust, PaineWebber Master Series, Inc., PaineWebber Municipal Series. PaineWebber Olympus Fund, and each portfolio thereof and any future portfolios thereof that will issue multiple classes of shares which are identical in all material respects to the classes described herein, and any other openend management investment companies established or acquired in the future that are in the same "group of investment companies" as that term is defined in rule 11a-3 under the Act and which issue multiple classes of shares that are identical in all material respects to the classes described herein (the "Funds"); PaineWebber Incorporated ("PaineWebber"); and Mitchell Hutchins Asset Management Inc. ("Mitchell Hutchins").

RELEVANT ACT SECTIONS: Order requested under section 6(c) of the Act for exemptions from sections 18(f), 18(g), 18(i), 22(c), and 22(d) of the Act and rule 22c-1 thereunder.

SUMMARY OF APPLICATION: Applicants seek to amend a prior order (i) to permit the Funds to sell a fourth class of securities pursuant to a multiple distribution arrangement (the "Flexible Pricing System"), and (ii) to permit the Funds to impose a contingent deferred sales charge ("CDSC") on redemptions

within one year of purchase for shares that were sold pursuant to a complete front-end sales load waiver applicable to large purchases.

FILING DATES: The application was filed on October 22, 1991 and amended on April 23, 1992.

HEARING OR NOTIFICATION OF HEARING: An order granting the application will be issued unless the SEC orders a hearing. Interested persons may request a hearing by writing to the SEC's Secretary and serving applicants with a copy of the request, personally or by mail. Hearing requests should be received by the SEC by 5:30 pm. on June 29, 1992, and should be accompanied by proof of service on the applicants, in the form of an affidavit or, for lawyers, a certificate of service. Hearing requests should state the nature of the writer's interest, the reason for the request, and the issues contested. Persons who wish to be notified of a hearing may request notification by writing to the SEC's Secretary.

ADDRESSES: Secretary, SEC, 450 Fifth Street, NW., Washington, DC 20549. Applicants, 1285 Avenue of the Americas, New York, New York 10019.

FOR FURTHER INFORMATION CONTACT: James E. Anderson, Law Clerk, at (202) 272–7027, or C. David Messman, Branch Chief, at (202) 272–3018 (Division of Investment Management, Office of Investment Company Regulation).

SUPPLEMENTARY INFORMATION: The following is a summary of the application. The complete application may be obtained for a fee from the SEC's Public Reference Branch.

Applicants' Representations:

1. Each of the Funds is an open-end management investment company registered under the Act. Several of the Funds consist of multiple investment portfolios, each of which has separate objectives, policies, and segregated assets. Each Fund is organized as a Massachusetts business trust, except Paine Webber Master Series, Inc. and Paine Webber Regional Financial Growth Fund Inc., which are Maryland corporations.

2. Each Fund has entered into or will enter into an investment advisory and administration agreement with Mitchell Hutchins. Each Fund has entered into or will enter into a distribution agreement with Mitchell Hutchins. Mitchell Hutchins, in turn, has an exclusive dealer arrangement with respect to each Fund with PaineWebber. As used herein, the term "Manager" refers to Mitchell Hutchins in its role as investment adviser of the Funds and the

term "Distributor" refers to both
Mitchell Hutchins and PaineWebber in
their respective roles as distributor and
exclusive dealer of the Funds. Mitchell
Hutchins is registered as an investment
adviser under the Investment Advisers
Act of 1940. Mitchell Hutchins and
PaineWebber are each registered as
broker-dealers under the Securities

Exchange Act of 1934.

3. Class A shares of the Funds are offered to investors at their current net asset value plus a front-end sales load. The Funds, on behalf of the Class A shares, also pay fees to Mitchell Hutchins under rule 12b-1 plans. Class B shares of the Funds are currently offered to the public at their current net asset value per share without imposing a sales load at the time of purchase. The Funds, on behalf of the Class B shares, pay the Distributor fees pursuant to rule 12b-1 plans., These fees are imposed for a period of six years following the purchase of Class B shares, at which time such shares convert automatically to Class A shares. In addition, an investor's proceeds from a redemption of the Funds' Class B shares made within a specified period of time after purchase may be subject to a CDSC which is paid to Mitchell Hutchins. The CDSC is imposed pursuant to the exemptive relief previously granted to the Funds by the SEC (the "Prior Order"),1 which allows the Funds to issue and, sell three classes of securities. Several Funds currently offer Class C shares to certain benefit plans and unit investment trusts without imposing either a front-end sales load. CDSC or a continuing service or

distribution fee. 4. Applicants propose to amend the Prior Order to allow each of the Funds to offer a fourth class of shares subject to a distribution fee for an indefinite period, at an annual rate of up to 0.75% of each Fund's average daily net assets, and an ongoing service fee, currently expected to be charged at an annual rate of up to 0.25% of average daily net assets ("Class D shares"). The Class D shares will not be subject to either a front-end sales load or a CDSC. The Funds' public shareholders will approve the rule 12b-1 plan. The Funds reserve the right to impose such fees at such higher rates as may be determined. The public offering price of the Class D shares will be the current net asset value of such shares. The distribution and servicing fees imposed by the Funds under the Flexible Pricing System will comply with the amendment to the

6. Investment executives or sales personnel selling shares of the Funds may be compensated at different levels or in a different manner for sales of the different shares. Applicants believe that it is impossible to generalize as to which class will provide the investment executive with the higher levels of compensation. Each Fund's prospectus will reflect that investment executives may receive different levels of compensation for selling different shares. The Distributor will adopt guidelines as to when each class of shares may be sold to particular investors.

7. Each Fund's prospectus will disclose the respective expenses. performance data, distribution arrangements, services, fees, sales loads, and exchange privileges applicable to each class of shares sold through the prospectus. Class A, Class B, and Class D shares will be offered and sold through a single prospectus. The shareholder reports of each Fund will disclose the respective expenses and performance data applicable to each class of shares. The shareholder reports will contain, in the statements of assets and liabilities and the statement of operations, information related to the Fund as a whole generally and not on a per class basis. Each Fund's per share data, however, will be prepared on a per class basis with respect to all classes of

shares of such Fund. To the extent any advertisement or sales literature describe the expenses and/or performance data applicable to Class A, Class B, or Class D shares, it will disclose the expenses and/or performance data applicable to each of those classes.

8. If a shareholder owns both Class A and Class B shares, but not Class D shares, of a Fund, the shareholder's redemption request would be satisfied by redeeming the shareholder's Class A shares, unless the shareholder has made a specific election to redeem Class B shares. Redemption requests placed by shareholders who own Class A, Class B, and Class D shares of a Fund would be satisfied first by redeeming the shareholder's Class D shares, unless the shareholder has made a specific election to redeem the Class A or Class B shares first. If a shareholder owns both Class B and Class D shares, but not Class A shares, of a Fund, the shareholder's redemption request would be satisfied first by redeeming the shareholder's Class D shares, unless the shareholder has made a specific election to redeem Class B shares.

9. The gross income and all expenses of the outstanding shares of a Fund, except for the expenses specifically attributable to a particular class of shares ("Class Expenses"), will be allocated among the classes of shares of the Fund on the basis of their relative net assets.2 Because of the ongoing distribution fee and potentially higher Class Expenses (specifically, as a result of a higher transfer agency fee) paid by the holders of Class B shares and the ongoing distribution fee paid by holders of Class D shares, the net income attributable to and the dividends payable on both Class B and Class D shares would be lower than the net income attributable and dividends payable on Class A shares. In addition, because the Class C shares will not bear any rule 12b-1 fee and because it is anticipated that the transfer agency fees may be lower than those attributed to the other shares, the net income attributable to the dividends payable on Class C shares would be higher than the net income attributable to and the dividends payable on the other classes of shares.

Rules of Fair Practice promulgated by the National Association of Securities Dealers, Inc. ("NASD") that would subject "asset-based" distribution charges, including rule 12b-1 fees, to regulation as sales loads under those rules, if such amendment is approved by the SEC.

^{5.} Applicants believe the Flexible Pricing System permits investors to choose the method of purchasing shares that is most beneficial given the length of time the investor expects to hold his or her shares and other relevant circumstances. Investors who would qualify for a significant front-end sales load discount may prefer Class A, thus avoiding the CDSC and six years of distribution fees applicable to Class B, or the distribution fees imposed on Class D for an infinite period. Investors whose orders would not qualify for the front-end sales load discount, and who intend to remain invested in a Fund for more than the CDSC period, may prefer to choose Class B shares. Investors whose orders would not qualify for the front-end sales load discount, and who are uncertain as to their holding period or expect it to be shorter than the CDSC period, may prefer to purchase Class D shares.

Investment Company Act Release Nos. 18084 (April 9, 1991) (notice) and 18126 (May 1, 1991) (order)

^{*} The Prior Order provided that each class of shares could beat any rule 12b-1 fees or transfer agency costs solely attributable to that class, and such other incremental expenses, subsequently identified as properly allocated to one class, which shall be approved by order of the SEC. Set forth in condition 1 below is a complete list of Class Expenses that would be permitted by the requested order.

10. Another difference among the Class A, Class B, Class C, and Class D shares will be the exchange privileges applicable to the shares. Currently, Class B shares of a Fund are exchangeable only for Class B shares of the other Funds, including Class B shares of PaineWebber Money Market Fund, a series of PaineWebber Master Series, Inc. which is a money market fund with a rule 12b-1 fee. Class A shares of a Fund are exchangeable only for Class A shares of the other Funds and shares of certain money market funds sponsored by the Manager, including Class A shares of PaineWebber Money Market Fund.3 At present, the Class C shares of a Fund are not exchangeable; however, if the Class C shares become exchangeable, they will be exchangeable only for Class C shares of the other Funds and shares of certain money market funds. including Class C shares of PaineWebber Money Market Fund. Class D shares of a Fund likewise will be exchangeable only for Class D shares of the other Funds and Class D shares of PaineWebber Money Market Fund.

11. Applicants also request an amendment to the Prior Order to permit the Funds to assess a CDSC on redemptions of Class A shares sold pursuant to a complete front-end sales load waiver applicable to large purchases, if such shares are redeemed within one year of purchase. Currently, the front-end sales load is waived for sales of Class A shares where the amount of purchase exceeds \$1,000,000, although this amount may be changed in the future. The CDSC would be imposed only on such Class A shares issued on or after the date the amended order requested hereby is granted. The CDSC applicable to these Class A shares would be calculated in the same manner as the CDSC with respect to the Class B shares described in the Prior Order. However, the amount of the CDSC will be limited to 1% of the investor's aggregate purchase payments.

Applicants' Legal Conclusions

1. Applicants request an exemptive order to the extent that the proposed issuance and sale of Class A, Class B, Class C, and Class D shares representing interests in the Funds might be deemed: (a) To result in the issuance

3 Other money market fund shares that are initially purchased for cash are not exchangeable; rather, such money market fund shares must be redeemed and the redemption proceeds used to purchase Class A, Class B, or Class D shares. PaineWebber Money Market Fund will be the only money market fund whose shares will be exchangeable with shares of the Funds without imposition of any sales charge

of a "senior security" within the meaning of section 18(g) of the Act and thus be prohibited by section 18(f)(1) of the Act; and (b) to violate the equal voting provisions of section 18(i) of the Act.

2. Section 18 is intended to prevent investment companies from issuing excessive amounts of senior securities and thereby increasing unduly the speculative character of their junior securities, or from operating without adequate assets or reserves. The Flexible Pricing System does not raise any of the legislative concerns that section 18 of the Act was designed to ameliorate. Under the Flexible Pricing System, mutuality of risk will be preserved with respect to each class of shares in a Fund. The flexible pricing system does not involve borrowings and does not affect the Funds' existing assets. Investors will not be given misleading impressions as to the safety or risk of any class of shares, and the nature of any class of shares will not be rendered speculative. The Funds' capital structures will not induce any group of shareholders to invest in risky securities to the detriment of any other group of shareholders, nor will it enable insiders to manipulate expenses and profits among the various classes of shares of a Fund.

3. The rights and privileges of each class of shares are substantially identical, and the possibility of conflicting interests is remote. The interests of the various classes with respect to distribution and/or service fees are protected by the required annual review of such fees by the Directors/Trustees.

4. The proposed allocation of expenses and voting rights relating to the rule 12b-1 plans in the manner described above is equitable and would not discriminate against any group of shareholders.

5. Under the proposed Flexible Pricing System, an investor will be able to choose the method of purchasing shares that is most beneficial given the amount of his or her purchase, the length of time that the investor expects to hold his or her purchase, and other relevant circumstances. The proposed arrangement would permit the Funds to facilitate both the distribution of their securities and provide investors with a broader choice as to method of purchasing shares without assuming excessive accounting and bookkeeping costs or unneccesary investment risks.

Applicants' Conditions

An order granting the requested exemptions will be subject to the

following conditions set forth in the application:

Conditions Relating to the Flexible Pricing System

1. Each class of shares will represent interests in the same portfolio of investments of a Fund and be identical in all respects, except as set forth below. The only differences among various classes of shares of the same Fund will relate solely to: (a) The impact of the respective rule 12b-1 plan payments made by each of the Class A shares, Class B shares, or Class D shares of a Fund, or, in the case of the Class C shares, the absence of any such distribution or service fees, and any Class Expenses that may be imposed upon a particular class of shares and which are limited to (i) transfer agency fees attributable to a specific class of shares, (ii) printing and postage expenses related to preparing and distributing materials such as shareholder reports, prospectuses and proxies to current shareholders of a specific class, (iii) blue sky registration fees incurred by a class of shares, (iv) SEC registration fees incurred by a class of shares, (v) the expenses of administrative personnel and services as required to support the shareholders of a specific class, (vi) litigation or other legal expenses relating solely to one class of shares, (vii) Directors/Trustees' fees incurred as a result of issues relating to one class of shares, and (viii) any other incremental expenses subsequently identified that should be properly allocated to one class which shall be approved by the SEC pursuant to an amended order; (b) voting rights on matters which pertain to rule 12b-1 plans; (c) the different exchange privileges of the various classes of shares as described in the prospectuses (and as more fully described in the statement of additional information) of the Funds; (d) the conversion feature applicable only to the Class B shares; and (e) the designation of each class of shares of a Fund.

2. The Directors/Trustees of each of the Funds, including a majority of the independent Directors/Trustees, shall have approved the Flexible Pricing System, and the amendments thereto, prior to the implementation or amendment of the Flexible Pricing System by a particular Fund. The minutes of the meetings of the Directors/Trustees of each of the Funds regarding the deliberations of the Directors/Trustees with respect to the approvals necessary to implement or amend the Flexible Pricing System will reflect in detail the reasons for

determining that the Flexible Pricing System or the amendment thereof is in the best interests of both the Funds and their respective shareholders.

3. The initial determination of the Class Expenses, if any, that will be allocated to a particular class of a Fund and any subsequent changes thereto will be reviewed and approved by a vote of the Directors/Trustees including a majority of the independent Directors/ Trustees. Any person authorized to direct the allocation and disposition of the monies paid or payable by a Fund to meet Class Expenses shall provide to the Directors/Trustees, and the Directors/Trustees shall review, at least quarterly, a written report of the

amounts so expended and the purposes

for which such expenditures were made. 4. On an ongoing basis, the Directors/ Trustees of the Funds, pursuant to their fiduciary responsibilities under the Act and otherwise, will monitor each Fund for the existence of any material conflicts among the interests of the various classes of shares. The Directors/ Trustees, including a majority of the independent Directors/Trustees, shall take such action as is reasonably necessary to eliminate any such conflicts that may develop. The Manager and the Distributor will be responsible for reporting any potential or existing conflicts to the Directors/ Trustees. If a conflict arises, the Manager and the Distributor at their own costs will remedy such conflict up to and including establishing a new registered management investment company.

5. Any rule 12b-1 plan adopted or amended to permit the assessment of a rule 12b-1 fee on any class of shares which has not had its rule 12b-1 plan approved by the public shareholders of that class will be submitted to the public shareholders of such class for approval at the next meeting of shareholders after the initial issuance of the class of shares. Such meeting is to be held within 16 months of the date that the registration statement relating to such class first becomes effective or, if applicable, the date that the amendment to the registration statement necessary to offer such class of shares first

becomes effective.

6. The Directors/Trustees of the Funds will receive quarterly and annual statements complying with paragraph (b)(3)(ii) of rule 12b-1, as it may be amended from time to time. In the statements, only distribution expenditures properly attributable to the sale of a class of shares will be used to support the rule 12b-1 fee charged to shareholders of such class of shares. Expenditures not related to the sale of a

specific class of shares will not be presented to the Directors/Trustees to support rule 12b-1 fees charged to shareholders of such class of shares. The statements, including the allocations upon which they are based, will be subject to the review and approval of the independent Directors/ Trustees in the exercise of their fiduciary duties.

7. Dividends paid by a Fund with respect to each class of shares, to the extent any dividends are paid, will be calculated in the same manner, at the same time, on the same day and will be in the same amount, except that fee payments made under the rule 12b-1 plans relating to the Class A. Class B and Class D shares, respectively, will be borne exclusively by each such class and except that any Class Expenses may be borne by the applicable class of

shares. 8. The methodology and procedures for calculating the net asset value and dividends/distributions of the various classes and the proper allocation of income and expenses among such classes will be reviewed by an expert (the "Independent Examiner"). The Independent Examiner has supplemented its prior report to the applicants and such supplement was filed with the SEC as an exhibit to the application, stating that such methodology and procedures are adequate to ensure that such calculations and allocations will be made in an appropriate manner, subject to the conditions and limitations in that report. On an ongoing basis, the Independent Examiner, or an appropriate substitute Independent Examiner, will monitor the manner in which the calculations and allocations are being made and, based upon such review, will render at least annually a report to the Funds that the calculations and allocations are being made properly. The reports of the Independent Examiner shall be filed as part of the periodic reports filed with the SEC pursuant to section 30(a) and 30(b)(1) of the Act. The work papers of the Independent Examiner with respect to such reports, following request by the Funds which the Funds agree to make, will be available for inspection by the SEC staff upon the written request for such work papers by a senior member of the Division of Investment Management or of a Regional Office of the SEC, limited to the Directors, an Associate Director, the Chief Accountant, the Chief Financial Analyst, an Assistant Director, and any Regional Administrators or Associate and

Assistant Administrators. The initial

report of the Independent Examiner is a

"Special Purpose" report on the "Design of a System and Certain Compliance Tests" as defined and described in the Statement of Accounting Standards No. 44 of the American Institute of Certified Public Accounts, as it may be amended from time to time, or in similar auditing standards as may be adopted by the AICPA from time to time.

9. Applicants have adequate facilities in place to ensure implementation of the methodology and procedures for calculating the net asset value and dividends/distributions among the various classes of shares and the proper allocation of income and expenses among such classes of shares and this representation has been concurred with by the Independent Examiner in the initial report referred to in condition (8) above and will be concurred with by the Independent Examiner, or an appropriate substitute Independent Examiner, on an ongoing basis at least annually in the ongoing reports referred to in condition (8) above. Applicants agree to take immediate corrective action if the Independent Examiner, or appropriate substitute Independent Examiner, does not so concur in the ongoing reports.

10. The prospectuses of the Funds relating to Class A, Class B and Class D shares will include a statement to the effect that an investment executive may receive different levels of compensation for selling one particular class of shares

over another in a Fund.

11. The Distributor will adopt compliance standards as to when Class A, Class B, Class C, and Class D shares may appropriately be sold to particular investors. Applicants will require all persons selling shares of the Funds to agree to conform to these standards. Applicants' compliance standards will require all investors eligible to purchase Class C shares of a Fund offering such shares to invest in Class C, rather than Class A. Class B. or Class D shares of such Fund.

12. The conditions pursuant to which the exemptive order is granted and the duties and responsibilities of the Directors/Trustees of the Funds with respect to the Flexible Pricing System will be set forth in guidelines which will be furnished to the Directors/Trustees as part of the materials setting forth the duties and responsibilities of the Directors/Trustees.

13. Each Fund will disclose in its prospectus the respective expenses, performance data, distribution arrangements, services, fees, sales loads, deferred sales loads, and exchange privileges applicable to each class of shares offered through the

prospectus. Class A, Class B, and Class D shares will be offered and sold through a single prospectus. If Class C shares of a Fund are offered solely via a separate prospectus, the prospectus for the Class A, Class B, and Class D shares of that Fund All identify the existence of the Class C shares of the Funds and will identify the entities eligible to purchase such shares, and the Class C prospectus will identify the existence of the Fund's Class A, Class B, and Class D shares. The shareholder reports of each Fund will disclose the respective expenses and performance data applicable to each class of shares. The shareholder reports will contain, in the statement of assets and liabilities and statement of operations, information related to the Fund as a whole generally and not on a per class basis. Each Fund's per share data, however, will be prepared on a per class basis with respect to all classes of shares of such Fund. To the extent any advertisement or sales literature describes the expenses or performance data applicable to Class A, Class B, or Class D shares, it will disclose the expenses and/or performance data applicable to both classes. Advertising materials reflecting the expenses or performance data for Class C shares will be available only to Class C eligible investors. The information provided by applicants for publication in any newspaper or similar listing of the Funds' net asset values and public offering prices will separately present Class A, Class B, and Class D shares.

14. Applicants acknowledge that the grant of the exemptive order requested by this application will not imply SEC approval, authorization or acquiescence in any particular level of payments that the Funds may make pursuant to rule 12b-1 plans in reliance on the exemptive order.

15. Class B shares will convert to Class A shares on the basis of the relative net asset values of the two classes without the imposition of any sales load, fee or other charge.

Condition Relating to the CDSC

Applicants will comply with the provisions of proposed rule 6c-10 under the Act, Investment Company Act Release No. 16619 (November 2, 1988), as such rule is currently proposed, and as it may be reproposed, adopted, or amended.

For the SEC, by the Division of Investment Management, under delegated authority. Margaret H. McFarland,

Deputy Secretary.

[FR Doc. 92-13820 Filed 6-11-92; 8:45 am]

[Release No. 35-25551; International Series Release No. 396]

Filings Under the Public Utility Holding Company Act of 1935 ("Act")

June 5, 1992.

Notice is hereby given that the following filing(s) has/have been made with the Commission pursuant to provisions of the Act and rules-promulgated thereunder. All interested persons are referred to the application(s) and/or declaration(s) for complete statements of the proposed transaction(s) summarized below. The application(s) and/or declaration(s) and any amendments thereto is/are available for public inspection through the Commission's Office of Public Reference.

Interested persons wishing to comment or request a hearing on the application(s) and/or declaration(s) should submit their views in writing by June 29, 1992 to the Secretary, Securities and Exchange Commission, Washington, DC 20549, and serve a copy on the relevant applicant(s) and/or declarant(s) at the address(es) specified below. Proof of service (by affidavit or, in case of an attorney at law, by certificate) should be filed with the request. Any request for hearing shall identify specifically the issues of fact or law that are disputed. A person who so requests will be notified of any hearing, if ordered, and will receive a copy of any notice or order issued in the matter. After said date, the application(s) and/ or declaration(s), as filed or as amended, may be granted and/or permitted to become effective.

Houston Industries Incorporated (70–7963)

Houston Industries Incorporated ("HII"), Five Post Oak Park, 4400 Post Oak Parkway, Houston, Texas 77027, a Texas public-utility holding company exempt from registration under section 3(a)(1) of the Act pursuant to rule 2, has filed an application in connection with the proposed acquisition of an interest in a to-be-formed Argentine electric public utility company ("Acquired Utility"). HII requests orders under section 3(b) of the Act granting an unqualified exemption to Acquired Utility and HII Sub, a to-be-formed wholly owned United States nonutility subsidiary company that will acquire up to a 25% ownership interest in Acquired Utility through a to-be formed partially owned Argentine subsidiary company ("Argentine Holding Company"). Alternatively, HII requests an order of the Commission under sections 9(a)(2) and 10 approving the proposed

acquisition of an interest in Acquired Utility and granting exemptions under section 3(a)(5) from all provisions of the Act except section 9(a)(2) to HII Sub and Argentine Holding Company.

HII has one public-utility company subsidiary, Houston Lighting & Power Company ("HL&P"), which is engaged in the generation, transmission, distribution and sale of electric energy at retail and wholesale within the State of Texas. HII also owns all of the capital stock of several nonutility subsidiary companies. HII and HL&P reported operating revenues of approximately \$4.18 billion and \$3.47 billion, respectively, in 1990.

As part of its privatization program, the Argentine government has authorized Servicios Electricos del Gran Buenos Aires ("SEGBA"), a state corporation that currently serves the electricity needs of the City of Buenos Aires and the surrounding area, to sell a 51% interest in Acquired Utility. HII intends to participate with Techint Compania Tecnica Internacional S.A.C.I. ("Techint"), a privately owned Argentine company, in a bid for the 51% interest. If the bid is successful, HII and Techint will acquire the ownership interest through Argentine Holding Company, in which HII Sub will hold an ownership interest not exceeding 49%.1 In addition, it is contemplated that HII Sub will provide management and technical services to Acquired Utility.

Although the actual amount of HII's investment will not be determined until a formal bid is made, the application states that HII will not invest more than \$100 million. HII's investment will be made in cash derived from HII's general corporate funds through borrowings under established lines of credit or through other short-term borrowings. HII represents that: (1) No funds will be provided by HL&P; (2) neither HII nor any affiliate company of HII will provide, directly or indirectly, any guaranty or other form of credit support with respect to any indebtedness which may be incurred by HII Sub, Argentine Holding Company and/or Acquired Utility; and (3) there will be no business transactions between Acquired Utility and HII and/or any affiliate company of HII, other than HII Sub; except that employees of HL&P may provide management and technical services to

¹ Techint will own the remaining 51% interest. The application states, however, that certain financial institutions have expressed an interest in participating with Techint and HII in the acquisition, in which event the various indirect percentage interests of Techint, HII and HII Sub in Acquired Utility will be proportionately reduced.

Acquired Utility, for which HL&P will be HII states that it will continue to qualify

appropriately compensated.

Acquired Utility will be an "electric utility company" as defined in section 2(a)(3). As a result, HII, HII Sub, Techint and Argentine Holding Company will each be a "holding company" within the meaning of section 2(a)(7) with respect to Acquired Utility, and Acquired Utility will be a direct or indirect "subsidiary company" of each within the meaning of section 2(a)(8). HII Sub will also be an "electric utility company" within the meaning of section 2(a)(3) because it will operate Acquired Utility.

HII requests orders of exemption under section 3(b) for Acquired Utility and HII Sub. The application states that neither Acquired Utility nor HII Sub will derive a material part of its income, directly or indirectly, from sources within the United States, and will not operate, or have any subsidiary company that operates as a public company in the United States. The application also states that, if unqualified exemptions are granted, Argentine Holding Company and HII Sub will rely upon rule 10(a)(1) to provide an exemption insofar as each is a holding company; and HII will rely on rule 11(b)(1) to provide an exemption from the approval requirements of sections 9(a)(2) and 10 to which HII would otherwise be subject.

If unqualified orders of exemption are not granted, HII requests authorization under sections 9(a) (2) and 10 to organize and acquire HII Sub, to participate in the organization and acquisition of up to a 49% interest in Argentine Holding Company through HII Sub, and to acquire up to a 25% interest in Acquired Utility through Argentine Holding Company. HII also requests orders under section 3(a)(5) exempting HII Sub and Argentine Holding Company from all provisions of the Act,

except section 9(a)(2).2

The application states that one-half of SEGBA's total revenues for its fiscal 1990 year (the most recent financial data available) was equivalent to approximately \$600 million. Based on a 25% interest in Acquired Utility, HII's pro forma share of such revenues would be \$150 million (or approximately 3.5% of HII's consolidated revenues in 1990).

HII states that it will continue to qualify as an exempt holding company under section 3(a)(1) after the acquisition.

HII has provided a copy of the application to the Public Utility Commission of Texas ("PUC") and has asked the PUC to communicate to this Commission any comments it may have with respect to the application prior to June 30, 1992. HII further states that it will file with this Commission copies of all material contracts to which HII Sub, Argentine Holding Company and/or Acquired Utility become parties, including, without limitation, any operating agreements, agreements for the provision of management and technical assistance, power supply agreements and shareholders' agreements.

System Fuels, Inc., et al. (70-8001)

System Fuels, Inc. ("SFI"), 225 Baronne Street, New Orleans, Louisiana 70112, a fuel supply company jointly owned by Arkansas Power & Light Company ("AP&L"), 425 West Capitol, 40th Floor, Little Rock, Arkansas 72201, Louisiana Power & Light Company ("LP&L"), 317 Baronne Street, New Orleans, Louisiana 70112, Mississippi Power & Light Company ("MP&L"), 308 East Pearl Street, Jackson, Mississippi 39201 and New Orleans Public Service Inc. ("NOPSI"), 317 Baronne Street, New Orleans, Louisiana 70112 (all companies collectively, "Applicants"), each an electric public utility subsidiary of Entergy Corporation, a registered holding company, have filed an application under sections 9(a) and 10 of the Act.

By orders dated November 1, 1979, August 25, 1980, June 15, 1982 and May 15, 1984 (HCAR Nos. 21277, 21689, 22556 and 23309), the Commission authorized SFI to acquire by leveraged lease ("Lease") 600, 750, 580 and 320 coal railroad cars ("Equipment"), respectively, for the transportation of coal to the White Bluff and Independence Steam Electric Generating Stations ("Stations"). Pursuant to the Lease transactions, the obligations of SFI are supported by SFI's parent companies (AP&L, LP&L, MP&L and NOPSI, collectively "Parents") by means of "keep-well" arrangements. Under these keep-well arrangements, the Parents agree, severally and to the extent of their percentage ownership of SFI, to keep SFI in sound financial condition and to place SFI in a position, and cause SFI, to perform and discharge all its obligations under the relevant Lease transaction agreements.

The Applicants now propose that AP&L assume SFI's rights and obligations under the Leases. Such assumption would release and discharge SFI from its obligations under the Leases, and the Parents would be released and discharged from their keep-well obligations.

In addition, AP&L proposes to sublease to nonaffiliate companies up to 50% of the Equipment, at any one time, that are leased by AP&L. A sublease of Equipment will not exceed one year in duration, and AP&L will sublease only that Equipment which exceed the needs for the transportation of coal to the Stations.

It is stated that any revenues realized from any sublease of Equipment will be credited against AP&L's costs as lessee of the Equipment. The Applicants state that the benefit from such lower cost of leasing the Equipment shall accrue to the other owners of the Stations on a pass-through basis. It is also stated that such revenues shall be reflected accordingly in AP&L's ratemaking provisions, except to the extent the regulatory authority having jurisdiction over the matters authorizes a different treatment. It is further stated that such revenues will be credited to "Fuel Inventory Accounts" (account number 151 under the Federal Energy Regulatory Commission's Uniform System of Accounts). In the event that AP&L changes this method of accounting for the revenues from subleasing, the Applicants state that AP&L will notify the Commission pursuant to a Rule 24 notification within 30 days of such change. It is stated that it is not anticipated that the proposed transactions will increase the cost of transporting coal to the Stations.

Entergy Corporation, et al. (70-8002)

Entergy Corporation ("Entergy"), 225 Baronne Street, New Orleans, Louisiana 70112, a registered holding company, its wholly owned nonutility subsidiary. Electec, Inc. ("Electec"), 639 Loyola Avenue, New Orleans, Louisiana 70113, and Entergy Power, Inc. ("EPI") (Entergy together with Electec and EPI "Applicants"), 425 West Capital Avenue, Little Rock, Arkansas 72201, a wholly owned nonutility subsidiary of Electec, have filed an applicationdeclaration under sections 2(a)(8), 3(a)(5), 3(b), 6(a), 7, 9(a), 10, 12(b), 13(b), and 13(f) of the Act and rules 10, 43, 45, 51, 83, 86, 87, 90, 91 and 95 thereunder.

Entergy has acquired an option ("Option") to participate in a consortium ("Consortium") with five other nonaffiliated companies * to acquire a 60%

² The application states that Techint, as a foreign entity, will rely for exemption as a holding company upon rule 5, since it does not own any utility assets located within the United States and has no subsidiary company or affiliate owning any assets so located.

³ Exhibit H to the application, filed on a confidential basis pursuant to rule 104(b), states the projected minimum annual revenue of Acquired Utility and minimum rate of return on HII's proposed investment.

The other Consortium members are three
Chilean companies, two Argentine companies and a
Continued
Con

interest in Argentina's Costanera steam electric generating facility ("Facility" for \$90.121 million and to operate and maintain the Facility. 5 The Facility presently is held by Central Costanera, S.A. ("Costanera"), a company wholly owned by the Argentine government and an electric utility company within the meaning of section 2(a)(3) of the Act. The remaining 40% of the shares of Costanera will be held by the Argentine government, with 10% to be transferred to employees of Costanera and the remainder to be sold in Argentina and internationally pursuant to public offerings. The Facility consists of seven natural gas/oil-fired generating units, with a total installed capacity of 1260 megawatts and serves the electricity needs of Buenos Aires. A Chilean member of the Consortium, Empresa Nacional de Electricidad, S.A., will operate the Facility.

Entergy seeks authority to exercise its Option prior to November 11, 1992, and thus to acquire indirectly up to a 5.99% voting interest in Costanera ("Alternative A"). A possibility exists that Entergy may indirectly acquire up to a 12.0% in Costanera ("Alternative B"). Under Alternative A, Entergy's obligations will not exceed \$22.5 million and under Alternative B, Entergy's obligations will not exceed \$45 million. Entergy's principal obligations will be the following: (1) To pay its percentage share of the Consortium's "common expenses" in connection with the submission of the bid to acquire 60% of Costanera; (2) to pay its share of the purchase price to the appropriate members of the Consortium, to make the required working capital contributions and to assume certain contingent liabilities of Costanera; 6 and (3) not to assign or dispose of its equity share in Costanera for a period extending five years after May 20, 1992 unless otherwise agreed by, among others, the Government of Argentina. The

Consortium members' principal rights, with respect to Costanera, are to have no more than two voting members out of three on the Comptrolling Committee ⁷ of Costanera, and to have five voting members out of eight voting members on the Board of Directors of Costanera.⁸

For tax reasons, Applicants anticipate that Entergy, indirectly through Electec, will form a new wholly owned subsidiary ("Entergy, S.A."), organized under Argentine law, to purchase and exercise the Option. Under Alternative A, Entergy will purchase up to 22,500 shares of Electec for \$1000 per share, and Electec, in turn, will acquire virtually all the common stock of Entergy S.A. Entergy S.A. then will purchase shares of the common stock of Costanera for \$9.01 million.

Should Entergy exercise Alternative B, Entergy will purchase up to 45,000 shares of the common stock of Electec for \$1,000 per share, and Electec, in turn, will acquire virtually all the common stock of Entergy S.A. for \$45 million. Entergy S.A. then will purchase up to 12% of the voting securities of Costanera for approximately \$18 million. 10

Electec seeks authority to provide consulting services to Costanera with respect to management, technical, operating, environmental and fuel supply training services on a competitive fee basis, which Applicants represent will neither favor nor discriminate against affiliates of Costanera. Electec expects that on an annual basis the provision of such services may range up to a maximum of \$1 million, with the average likely to be substantially less. Applicants request that any possible consulting arrangement between Electec and Costanera be exempt from section 13 and the rules promulgated thereunder.11

Electec may obtain services from its associate companies, Arkansas Power & Light Company ("AP&L"), Louisiana Power & Light Company ("LP&L"), Mississippi Power & Light Company ("MP&L"), New Orleans Public Service Inc. ("NOPSI"), EPI and Entergy
Services, Inc. ("ESI") to carry out its
consulting arrangements with
Costanera. Electec will reimburse its
associate companies at cost. Electec has
been previously authorized to obtain
services from AP&L, LP&L, MP&L,
NOPSI and ESI (HCAR No. 23200,
January 12, 1984).

Applicants request authorization for Electec to obtain services from EPI directly and for Electec to reimburse EPI at cost. EPI represents that it is not requesting authority in this application-declaration to purchase services from any other affiliate company.

As a result of the proposed transactions, under Alternative A. Entergy S.A. will become a subsidiary of Entergy within the meaning of section 2(a)(8) of the Act and Costanera will be an affiliate of Entergy within the meaning of section 2(a)(11)(A) of the Act.

Under Alternative B, both Entergy S.A. and Costanera will become subsidiaries of Entergy within the meaning of section 2(a)(8) of the Act, and Electec and Entergy S.A. will become holding companies within the meaning of section 2(a)(7) of the Act. Applicants request an order under section 3(b) exempting Entergy S.A. and Costanera, as subsidiary companies, from all provisions of the Act, and under section 3(a)(5), exempting Electec and Entergy S.A. as holding companies, from all provisions of the Act.

Applicants state that Entergy S.A. and Costanera will derive their income, directly or indirectly, only from Argentine sources and that neither Entergy S.A. nor Costanera nor any of their subsidiaries is a public-utility company operating within the United States. In addition, should Electec and Entergy S.A. become holding companies, Applicants state that Electec and Entergy S.A. will derive no material part of their income from subsidiary companies, which are companies the principal business of which within the United States is that of a public-utility company.

The Southern Company (70-8006)

The Southern Company ("Southern"), a registered holding company, 64 Perimeter Center East, Atlanta, Georgia 30346 has filed a declaration under section 12(b) of the Act and Rule 45 thereunder.

Southern proposes to use the proceeds from borrowing authorized in HCAR No. 25507 (March 31, 1992), together with treasury funds and proceeds from other external sources, to make capital contributions to its wholly owned

United States utility company. The Chilean companies are Empresa Nacional de Electricidad. S.A. (30.01%). Enersis, S.A. and Distribuidora Chilectra Metropolitana S.A. (collectively, 12%); the Argentine companies are Inter-Rio Holdings Establishment (7.50%) and Perez Companc S.A.C.F.I.M.F.A. and Sade S.A.C.C.I.F.I.M. (collectively, 7.50%); the United States company is PSI Resources Inc. (2.99%, with an option to acquire an additional 3%).

⁵ All monetary amounts are given in United States dollars.

⁶ The principal contingent hability includes the joint assumption by Costanera and the members of the Consortium in accordance with their respective percentage interests of a \$95 million, 20-year maturity, 1.5% interest rate loan from the Italian government to be utilized for the refurbishment of the Facility. Costanera also has \$66 million of short-term debt payable to Gas del Estado, YPF, and Banco de Nacion.

⁷ The Comptrolling Committee ("Commision Fiscalizadora") in Argentine corporations represents the shareholders before the Board of Directors.

^{*} There is a requirement that the 40% of the shares of Costanera not acquired by the Consortium Members be represented on the Board; the Public Shares and the Employee Shares will each be entitled to one voting member. Each member of the Board of Directors will have one vote.

One share of Entergy S.A. will be held by a nominee of Electec in order to conform with Argentine law.

¹⁰ In this event, a change in the structure may be required under the Act to provide for Entergy to acquire the common stock of Entergy S.A. directly.

¹¹ Applicants make no representation that the consulting services to be provided to Costanera will be provided at greater than or less than cost.

electric utility subsidiary, Mississippl Power Company ("Mississippi") Southern proposes to make such capital contributions, which will not exceed the aggregate amount of \$100 million, from time-to-time through June 30, 1994.

Mississippi will use the proceeds of any such capital contributions, together with other funds, to finance its electric utility business, including payment of a portion of its construction program.

For the Commission, by the Division of Investment Management, pursuant to delegated authority.

Margaret H. McFarland,

Deputy Secretary.

BILLING CODE 8010-01-M

DEPARTMENT OF TRANSPORTATION

National Highway Traffic Safety Administration

[Docket No. 92-06, Notice 2]

The Kelly-Springfield Tire Co.; Grant of Petition for Determination of Inconsequential Noncompliance

This notice grants the petition by The Kelly-Springfield Tire Company (Kelly-Springfield) of Cumberland, Maryland, to be exempted from the notification and remedy requirements of the National Traffic and Motor Vehicle Safety Act (15 U.S.C. 1381 et seq) for a noncompliance with Standard No. 109 on the basis that the noncompliance is inconsequential as it relates to motor vehicle safety.

Notice of receipt of the petition was published on February 13, 1992, and an opportunity afforded for comment (57 FR

Paragraph S4.3 of Standard No. 109 specifies that, "each tire shall have permanently molded into or onto both sidewalls, in letters and numerals not less than 0.078 inches high the * * * (e) Actual number of plies in the sidewall, and the actual number of plies in the tread area if different; * *

During the period of November 3. 1991, to December 7, 1991, Kelly-Springfield produced 1.848 P195/60R15 Cordovan Grand Prix Radial G/T tires which did not comply with No. 109. The subject tires were mislabeled "Tread 4 Plies (2 Polyester Cord + 2 Steel Cord), Sidewall 2 Plies (Polyester Cord)" on the non-serial sidewall. That sidewall should have read "Tread 3 Plies (1 Polyester Cord + 2 Steel Cord), Sidewall 1 Ply (Polyester Cord)" as marked on the serial sidewall. The error occurred as a result of using an incorrectly stamped mold. Kelly-Springfield supported its

petition for inconsequential noncompliance with the following:

All other labelled information as specified in Standard No. 109 Paragraph S4.3 (a) through (g) is correct and comply to Standard No. 109 in all respects, including the load and inflation pressure information. Additionally, all tires shipped with the above stated condition were properly labeled on the tread with the actual number of plies in the sidewall, and the actual number of plies in the tread area.

No comments were received on the petition.

As the petitioner states, the correct labeling information is to be found on the serial side of the tire, and on a paper label applied to the tread before the tire is sold. The improper information on the non-serial side of the tire bears no relationship to the performance of the tire. The petitioner has provided assurances that the tires comply with the strength and endurance requirements of the standard. The petition is similar to others which NHTSA has granted over the years.

Accordingly, it is hereby found that the petitioner has met its burden of persuasion that the noncompliance herein described is inconsequential as it relates to motor vehicle safety, and its petition is granted.

Authority: 15 U.S.C. 1417; delegation of authority at 49 CFR 1.50 and 49 CFR 501.8.

Issued: June 9, 1992.

Barry Felrice,

Associate Administrator for Rulemaking. [FR Doc. 92-13889 Filed 6-11-92; 8:45 am] BILLING CODE 4910-59-M

Denial of Motor Vehicle Petition

This notice sets forth the reason for the denial of a petition submitted to the National Highway Traffic Safety Administration (NHTSA) under Section 124 of the National Traffic and Motor Vehicle Safety Act of 1966, as amended (15 U.S.C. 1381 et seq.)

Donald L. Pevsner, Esq., petitioned the agency on February 12, 1992, to recall 1990 through 1992 model year Lexus LS 400, and 1992 model year Lexus models SC-400, ES-300, and SC-300. He included in his petition all other vehicles equipped with so-called electroluminescent dashboards which do not have audible and visible headlamp warning systems. The subject vehicles are designed so that, when the ignition key is turned on, the dashboard is illuminated. The petitioner is concerned that the illuminated dashboard will result in a false signal to a driver that the vehicle's roadway illumination lights are on when, in fact, they are not. The

petitioner believes that this can result in an unsafe condition and requests that such vehicles be recalled and be modified by adding an audible and visible headlight warning system.

The petitioner states that such warning systems are necessary to alert the driver to the fact that the headlamps are not illuminated when the ambient outside light falls below the lawful level for driving without having the headlamps illuminated. Mr. Pevsner based his petition on his observation that United States motorists have, over the course of more than half a century, become used to the fact that, when the dashboard lights are on, the parking lights or headlamps are also on.

The agency's safety standards for controls and displays in passenger cars, trucks, multipurpose vehicles, and buses are Federal Motor Vehicle Safety Standards Nos. 100 and 101, "Controls and Displays." These standards ensure the accessibility of motor vehicle controls and displays and facilitate their selection under daylight and nighttime conditions. There is no requirement which specifies a "telltale" indication for the headlamps being "on."

All new vehicles must be certified by the manufacturer to comply with applicable vehicle standards. Toyota has certified that the subject Lexus vehicles meet all applicable safety standards. A review of the information that Mr. Pevsner provided did not suggest a noncompliance to the safety standards on vehicle controls and displays.

The Pevsner also requested that the agency mandate the installation of the subject warning systems in all vehicles. Thus, in addition to petitioning the agency for a recall of existing vehicles. the petitioner has requested that NHTSA commence a rulemaking proceeding to require the installation of an audible and visible headlamp warning system.

The petitioner has provided no factual information indicating that accidents have occurred or will occur due to the lack of such a warning system. His request is based only on his view that the lack of such a warning system creates a safety concern. The agency reviewed its consumer complaint files and found no data to indicate that the drivers of the subject vehicles are experiencing safety-related problems with the electro-luminescent dashboard. The agency notes that vehicles with vacuum fluorescent displays exhibit performance similar to the electroluminescent displays of concern to Mr. Pevsner, in that they are illuminated when the ignition is on, without the

headlamps being turned on. Such displays have been in vehicles for many years and the agency is unaware of any data to indicate that these vehicles have a greater risk of accident involvement because of such illuminated displays.

A review of the available information revealed no defect trend in vehicles equipped with electro-luminescent dasboards. Existing state and local laws concerning the required use of headlamps under specified ambient light conditions, coupled with human behavioral actions to turn headlamps on when warranted by light conditions, are providing satisfactory safety performance. Therefore, with respect to that portion of Mr. Pevsner's petition concerning a safety recall, in consideration of the available information, it was concluded that there is not a reasonable possibility that an order concerning the notification and remedy of a safety-related defect in relation to the petitioner's allegations would be issued at the conclusion of an investigation.

With respect to that part of Mr. Pesvener's petition concerning requested regulatory changes, for the reasons cited above, it was also concluded that there is not a reasonable possibility that the requested rulemaking would be issued at the conclusion of a regulatory proceeding. Therefore, the petition is denied in its

Authority: Sec. 124, Public Law 93–492; 88 Stat. 1470 (15 U.S.C. 1410a); delegations of authority at 49 CFR 1.50 and 501.8.

Associate Administrator for Rulemaking, [FR Doc. 92–13892 Filed 6–11–92; 8:45 am] BILLING CODE 4910–59–M

Denial of Motor Vehicle Petition

This notice sets forth the reason for the denial of a portion of a petition submitted to the National Highway Traffic Safety Administration (NHTSA) under Section 124 of the National Traffic and Motor Vehicle Safety Act of 1966, as amended (15 U.S.C. 1381 et seq.) that requests a motor vehicle recall. It does not address another portion of the petition, which seeks a "stay" on the installation of passenger-side air bags in passenger cars.

Ms. Annemarie Shelness petitioned the agency on February 26, 1992, to order a halt of installation of passengerside air bags until or unless it can be shown that a deploying air bag poses no danger to an infant in a rear-facing child restraint, and to recall all vehicles equipped with passenger-side air bags for the purpose of warning owners of a potential danger and provide them with a warning label, urging them to affix that label on the air bag housing.

A survey of Owner's Manuals from manufacturers who provide air bags for the right front seating position disclosed that all of the manuals already contain cautions and warnings covering the use of infant seats to alert the owner or driver as to the need for proper usage and placement of such infant seats. In addition, many vehicles with passengerside air bags have similar warnings on the driver and passenger-side sun visors or in the glove box. Most manufacturers of vehicles with passenger-side air bags recommend that rear facing infant seats be placed in the rear seat, and warn that they should not be placed in the front passenger seat. The exception noted is Porsche, which reports that its vehicles have a confined rear seating area that is too small for the rear-facing child restraint to be installed. Instead, the right front seat has a long track which permits the seat to be moved sufficiently rearward to provide clearance for the installation of the rear-facing child restraint. The Porsche Owner's Manual contains the following caution: "Rearward facing child restraint system: Only use in the passenger seat in the rearmost adjusting position."

The agency has already acknowledged the value of consumer information concerning the interaction between passenger-side air bags and rear-facing child restraints. NHTSA's Consumer Advisory Bulletin, issued on December 10, 1991, stated, in part:

The safest position for any type of child seat is in the rear seat, even if a car is not equipped with a passenger-side air bag. This is particularly true when rear-facing infant safety seats are placed in a car with a passenger-side air bag because the child could be seriously injured if the air bag deploys. Rear-facing infant seats extend closer to the dashboard.

It further stated that:

If it is absolutely necessary to place a child in the front with the driver, the passenger seat should be moved back as far as possible. This will maximize the distance between the dashboard and the child seat and lessen the possibility of injury. The child seat should not come in contact with the dashboard.

A February 11, 1992, NHTSA News Release pointed out that a common error in child safety seat use is placing a rearfacing safety seat in the front seat of a car equipped with a passenger-side air bag. Finally, an April 1992 Consumer Information brochure points out that, "Rear-facing child safety seats should always go in the rear seat in cars equipped with passenger-side air bags."

The petitioner stated that she had viewed films and actual deployments concerning the interaction of air bags with rear-facing child restraints. On the basis of these, the petitioner indicated concern for the injuries that she believes could occur. However, the petitioner has presented no supporting information or factual data documenting the actual occurrence of child injuries resulting from the deployment of a passenger-side air bag while an infant was occupying a rear-facing child seat in the right front seating position. NHTSA has separately analyzed available data files on realworld crashes and found no record of child injuries in which a passenger-side air bag deployed and a rear-facing child seat was present. Additionally, analysis of the agency's computerized consumer complaint file has disclosed no complaints concerning this issue.

Because our review of all available information reveals that manufacturers have already provided owners with warnings concerning child restraint placement in vehicles equipped with passenger-side air bags, there is no reasonable possibility that an order concerning the notification and remedy of a safety-related defect in relation to the petitioner's allegations would be issued at the conclusion of an investigation. Further commitment of agency resources does not appear to be warranted. Therefore, the petition is denied.

Authority: Sec. 124, Public Law 93–492; 88 Stat. 1470 (15 U.S.C. 1410a); delegations of authority at 49 CFR 1.50 and 501.8.

Issued on: June 9, 1992.

DEPARTMENT OF THE TREASURY

Treasury Advisory Committee on Commercial Operations of the U.S. Customs Service

AGENCY: Departmental Offices, Treasury.

ACTION: Renewal of Treasury Advisory Committee on Commercial Operations of the U.S. Customs Service and solicitation of committee members.

SUMMARY: It is in the public interest to renew the Advisory Committee for another two-year term. This notice also establishes criteria and procedures for the selection of members. FOR FURTHER INFORMATION CONTACT: Dennis M. O'Connell, Director, Office of Tariff and Trade Affairs, Office of the Assistant Secretary (Enforcement), (202) 622-0220.

Pursuant to the Federal Advisory
Committee Act, 5 U.S.C. app. I (1982),
and section 9503(c) of the Omnibus
Budget Reconciliation Act of 1987 (Pub.
L. 100–203), the Assistant Secretary
(Enforcement) announces the renewal of
the following advisory committees:

Title: The Treasury Advisory
Committee on Commercial Operations
of the U.S. Customs Service.

Purpose: The purpose of the Committee is to present advice and recommendations to the Secretary of the Treasury regarding commercial operations of the U.S. Customs Service and to submit a report to Congress containing a summary of its operations and its views and recommendations.

Statement of Public Interest: It is in the public interest to continue the existence of the Committee upon expiration, under the provisions of the Advisory Committee Act, of its current two-year term. The Committee provides a critical forum for distinguished representatives of diverse industry sectors to present their views on major issues involving commercial operations of the Customs Service. These views are offered directly to senior Treasury and Customs officials on a regular basis in a candid atmosphere. There exists no other single body that serves a comparable function.

SUPPLEMENTARY INFORMATION:

Background

In the Omnibus Budget Reconciliation Act of 1987 (Pub. L. 100-203), Congress repealed the statutory mandate for a Customs User Fee Advisory Committee and directed the Secretary of the Treasury to create a new Advisory Committee on Commercial Operations of the U.S. Customs Service. The original Committee consisted of 20 members drawn broadly from industry sectors affected by Customs commercial operations. The Committee's charter was filed on October 17, 1988 and expired two years later. A new charter was filed on October 17, 1990, renewing the Committee for an additional twoyear term. The renewed Committee held its first meeting on April 5, 1991, and it has met quarterly thereafter. The current term of the Committee will end with the expiration of the current charter on October 18, 1992. The Treasury Department plans to file a new charter by that date renewing the Committee for a third two-year term.

Objectives, Scope and Description of the Committee

The Committee's objectives are to advise the Secretary of the Treasury on issues relating to the commercial operations of the Customs Service. It is expected that, during its third two-year term, the Committee will consider such issues as proposed customs modernization legislation, the North American Free Trade Agreement negotiations, the Merchandise Processing Fee, Harbor Maintenance Fee issues, administration of staff and resources for commercial operations, commercial and trade enforcement, administration and enforcement of export control laws, impact of Customs commercial operations on ports and carriers, automated systems, and the President's regulatory moratorium and deregulation initiative.

The Committee will be chaired by the Assistant Secretary of the Treasury for Enforcement. The Committee will function for a two-year period before renewal or abolishment and will meet approximately eight times (quarterly) during the period. The meetings will generally be held in the Treasury Department, Washington, DC. However, one or two meetings may be held outside of Washington during the two-year period, particularly at port locations (e.g. New York, San Diego, Miami).

The members shall be selected by the Secretary of the Treasury from representatives of the trade or transportation community serviced by Customs, the general public, or others who are directly affected by Customs commercial operations. In addition, members shall represent major regions of the country, and not more than ten members may be affiliated with the same political party. No person who is required to register under the Foreign Agents Registration Act as an agent or representative of a foreign principal may serve on an advisory committee. Members shall not be paid compensation nor shall they be considered Federal Government employees for any purpose. No per diem, transportation, or other expenses are reimbursed for the cost of attending Committee meetings at any location.

Members who are serving on the Committee during its expiring two-year term are eligible to reapply for membership. However, it is expected that approximately half of the current membership of the Committee will be replaced with new appointees. Membership on the Committee is personal to the appointee. Under the Committee By-Laws, a member may not

send an alternate to represent him at a Committee meeting. However, since Committee meetings are open to the public, another person from a member's meetings are open to the public, another person from a member's organization may attend and observe the proceedings in a nonparticipating capacity. Regular attendance is essential; a member who is absent for two consecutive meetings or two meetings in a calendar year shall lose his seat on the Committee.

Application for Advisory Committee Appointment

Any interested person wishing to serve on the Treasury Advisory Committee on Commercial Operations of the U.S. Customs Service must provide the following:

- Statement of interest and reasons for application;
- —Complete professional biography or resume;
- —Political affiliation, in order to ensure balanced representation.

In addition, applicants must state in their applications that they agree to submit to reappointment and annual security and tax checks.

The application period for interested candidates will extend to August 1, 1992. Applications should be submitted in sufficient time to be received by the closing date to the Director, Office of Tariff and Trade Affairs, Office of the Assistant Secretary (Enforcement), Department of the Treasury, 1500 Pennsylvania Avenue, NW., Washington, DC 20220.

Dated: June 5, 1992.

Peter K. Nunez,

Assistant Secretary (Enforcement).

Return of Tip Income and Allocated
Tips (Form 8027). Transmittal of
Employer's Annual Information
Return of Tip Income and Allocated
Tips (Form 8027–T).

Description: To help IRS in its
examinations of returns filed by
tipped employees, large food or
beverage establishments are required
to report annually information
concerning food or beverage
operations receipts, tips reported by
employees, and in certain cases, the
employer must allocate tips to certain
employees.

Respondents: Individuals or households, State or local governments, Businesses or other for-profit, Nonprofit organizations.

Estimated Number of Respondents/ Recordkeepers: 52,050. Estimated Burden Hours Per Respondent/Recordkeeper:

Frequency of Response: Annually.

Estimated Total Reporting/ Recordkeeping Burden: 346,456 hours. OMB Number: 1545-1132.

Regulation ID Number: INTL-536-89 Final.

Type of Review: Extension.

Title: Registration Requirements with Respect to Certain Debt Obligations; Application of Repeal of 30 Percent Withholding by the Tax Reform Act of 1984.

Description: The Internal Revenue
Service needs the information in order
to ensure that purchasers of bearer
obligations are not U.S. persons (other
than those permitted to hold
obligations under section 165(j)) and
to ensure that U.S. persons holding
bearer obligations properly report
income and gain on such obligations.
The people reporting will be financial
institutions holding bearer obligations.

Respondents: Businesses or other forprofit.

Estimated Number of Respondents/ Recordkeepers: 5,000.

Estimated Burden Hours Per Respondent/Recordkeeper: 10 minutes.

Frequency of Response: On occasion. Estimated Total Reporting/ Recordkeeping Burden: 852 hours.

OMB Number: 1545–1266. Form Number: IRS Form 8829. Type of Review: Extension.

Title: Expenses for Business Use of Your

Description: Internal Revenue Code
(IRC) section 280A limits the
deduction for business use minus
certain business deductions. Amounts
not allowed due to the limitations can
be carried over to the following year.
Form 8829 is used to verify that the
deduction is properly figured.

Respondents: Individual or households. Estimated Number of Respondents/ Recordkeepers: 4,000,000.

Estimated Burden Hours Per Respondent/Recordkeeper: Recordkeeping—52 minutes.

Learning about the law or the form—7 minutes.

Preparing the form—1 hour, 13 minutes.

Copying, assembling, and sending the form to the IRS—20 minutes.

Frequency of Response: Annually. Estimated Total Reporting/ Recordkeeping Burden: 10,200,000

Recordkeeping Burden: 10,200,000 hours.

Directive; Delegation of Authority to Purchase Certain Equipment and Facilities

Dated: June 5, 1992.

1. Delegation. By virtue of the authority vested in the Treasurer of the United States by Treasury Order 101-05, I hereby delegate to the Director, United States Mint, without limitation, all the authority vested in the Secretary by section 5111(c)(1) of title 31 of the United States Code (U.S.C.), as amended, related to the acquisition of articles, materials, supplies, and services (including equipment, manufacturing facilities, patents, patent rights, technical knowledge, and assistance) necessary to produce the coins referred to in title 31 U.S.C., as amended. Any action heretofore taken by the Director, United States Mint, which involved the exercise of authority hereby granted is affirmed and ratified.

2. Cancellation. Treasury Directive 19-01, "Delegation of Authority to Purchase Certain Equipment and Facilities," dated November 14, 1986, is superseded.

3. Office of Primary Interest. Office of the Treasurer of the United States.

UNITED STATES INFORMATION AGENCY

Samantha Smith Memorial Exchange Program; Youth Exchanges

AGENCY: United States Information Agency.

ACTION: Notice: Request for proposals.

SUMMARY: The United States Information Agency (USIA) invites applications from U.S. educational, cultural, and other not-for-profit institutions to conduct exchanges of youth under the age of 21 with Albania, Bulgaria, the Commonwealth of Independent States, Czechoslovakia, Estonia, Georgia, Hungary, Latvia, Lithuania, Poland, Romania, and the following former republics of Yugoslavia: Bosnia-Hercegovina, Croatia, Macedonia, and Slovenia. These exchanges represent part of the activities of the Samantha Smith Memorial Exchange Program and are subject to the availability of funding for the Fiscal Year 1993 program. A request for proposals in support of exchanges of college and university undergraduate students under the aegis of the Samantha Smith program will be published separately.

DATES: Deadline for proposals: All copies must be received at the U.S. Information Agency by 5 p.m. Washington, DC time on Friday, September 25, 1992. Faxed documents will not be accepted, nor will documents postmarked on September 25 but received at a later date. It is the responsibility of each grant applicant to ensure that complete proposals are received by the above deadline. Grants should begin on or after May 1, 1993.

ADDRESSES: The original and 12 copies of the completed application (stapled, not bound), including required forms, should be submitted by the deadline to: U.S. Information Agency, Ref: Samantha Smith Program—Youth Exchanges, Office of Grants Management, E/XE, room 357, 301 4th Street, SW., Washington, DC 20547.

FOR FURTHER INFORMATION CONTACT:
Interested organizations/institutions should contact Bruce B. Brown, at the U.S. Information Agency, 301 4th Street SW., Youth Programs Division, E/VY, room 357, (202) 619–6299; FAX (202) 619–5311, to request detailed application packets, which include award criteria additional to this announcement, all necessary forms, and guidelines for preparing proposals, including specific budget preparation information.

SUPPLEMENTARY INFORMATION: Pursuant to the Bureau's authorizing legislation, programs must maintain a non-political character and should be balanced and representative of the diversity of American political, social and cultural life.

Overview

Grant funding is intended to promote the exchange of young people 21 years of age or younger between the U.S. and Albania, Bulgaria, the Commonwealth of Independent States, Czechoslovakia, Estonia, Georgia, Hungary, Latvia, Lithuania, Poland, Romania, and the following former republics of Yugoslavia: Bosnia-Hercegovina, Croatia, Macedonia, and Slovenia. The Agency's main objective is to foster interaction between American and foreign youth. Consequently, extensive interaction is a requirement. Proposals should demonstrate how American and foreign youth will interact in a way that encourages the exchange of ideas, values and information.

Twenty-five percent (25%) of the available funds will be reserved for projects that have not received Samatha Smith grants in the past three years.

Grants are awarded to expand or enhance existing exchange programs or to encourage the development of new exchanges. Programs may involve the U.S. organization in a partnership with organizations in one or more countries. The minimum length of stay in country for any project is three weeks. Three categories of grants are being offered.

Category A—School-to-School Exchanges

A school-to-school exchange is one that involves a direct linkage between two elementary, middle, or high schools. An applicant must be a school or school district. The maximum grant for this category is \$10,000. The exchange should be reciprocal and should take place during the academic year when schools are in session. The proposal should provide detailed information on the classroom and other activities in both the U.S. and the partner country. The duration of projects may be one academic year, semester or short-term (generally understood to mean three to eight weeks). Schools receiving funding under other grants awarded by USIA for youth exchanges may not apply under this category.

Category B—Multiple School Partnership Programs

A maximum of \$150,000 is available for grants generally in the range of \$50,000 to \$75,000 in support of programs of exchanges between the U.S. and the CIS based on multiple school linkages. At its most basic level the typical project involves the annual exchange of groups of students and teachers among several school linkages for short-term stays during the academic year. Semester and year-long exchanges of individual student are also possible. The grants are intended only to partially subsidize the costs of the programs, which will be funded on the American side primarily by contributions from the participating students, their schools and communities. Applicants for these grants should furnish written evidence of a commitment from a CIS entity describing the nature of the services and source of funding that will be provided in the participating CIS schools and communities. Consortia will also be eligible for this grant.

Category C-General Youth Exchanges

This category includes all other projects, which will be eligible for grants of up to \$50,000. Semester and year-long high school study programs conducted by exchange organizations fall within this category. For short-term (3–8 weeks) exchanges, preference is given for projects with a thematic focus. Eligible

foci may include, but are not limited to:
the arts (theater, dance, music, fine arts,
literature, folklore, and film/video);
language and culture; science,
technology, and mathematics;
conservation and the environment;
historic preservation; museum training;
political, social and economic issues;
business and administrative/
management (including enterprise
promotion); and agriculture.

Projects requesting support for tours of performing arts groups or sports teams are eligible if the primary purpose of the program is interaction between international participants and their hosts. Tours of performing arts groups or sports groups where the primary activity is performance or competition are not eligible.

Organizations other than schools that seek funds for an academic high school exchange of six months duration or more must be designated by USIA as a Secondary School Exchange Visitor Program Sponsor.

Reciprocity is not a requirement for this category, but in general USIA gives preference to proposals for reciprocal exchanges. The proposal should provide detailed information on the activities in both the U.S. and the partner country. The number of U.S. and foreign participants should be roughly equal. Such proposals should provide written evidence that the U.S. organization has the commitment of a counterpart organization in the partner country willing and able to engage in the proposed activities. In most cases the counterpart organization should assume responsibility for the cost of hosting the American participants in the reciprocal portion of the program.

Guidelines

All categories of proposals must include:

- —Participant selection criteria and a description of the selection process. All participants must be under age 21 at the time they begin the program. Participants should be chosen for their actual or potential leadership qualities. The proposal should describe in detail the selection process for both U.S. and foreign participants. The ratio of adult escorts to youth participants should be as low as possible.
- Description of orientation programs.

 There should be ample introduction to the program theme, administrative procedures, basic historical, cultural and social information, and substantive issues likely to be raised by their U.S. of foreign counterparts.

Information concerning stays in the host country—Preference is generally given to longer stays in country. The proposal should describe in detail the selection process for both U.S. and foreign host families/institutions. Consideration will be given to those projects which for reasons or requirements of the partner country or countries are of short duration, but the length of stay in country must be a minimum of three weeks.

—Information concerning language qualifications—Speaking ability in the language of the host country for both American and foreign participants is preferred, but not required. Ideally some participants in each incoming delegation should be conversant in English, and some participants in each outgoing delegation should be conversant in the host country language.

 Details on planning. Proposal should evidence adequate lead/planning time to ensure a successful exchange.

Proposed Budget

Organizations must submit a comprehensive line item budget for which specific details are available in the application packet.

Allowable costs: Grant-funded expenditures will generally be limited to the following categories:

—In country travel and per diem, i.e., lodging, meals, clothing maintenance, and incidentals, or stipends.

 Orientation, honoraria, or preparation costs; briefing materials. Honoraria is limited to \$150/day/speaker.

 Educational and cultural enrichment at a limit of \$150 per each program youth participant.

Tutitions, conference/seminar registration fees, and other program admission fees.

—International travel, normally limited to partial support for Americans traveling to the CIS or East Europe, and East Europeans traveling to the U.S. CIS partner organizations should be encouraged to cover international travel.

 Administration costs (salaries, benefits, other direct and indirect costs) may not exceed 20% of the total funds requested.

 Applications should demonstrate substantial cost sharing in both program and administrative expenses.

Review Process

USIA will acknowledge receipt of all proposals and will review them for technical eligibility. Proposals will be deemed ineligible if they do not adhere to the guidelines established herein and in the application packet. Eligible proposals will be forwarded to panels of USIA officers for advisory review. All eligible proposals will also be reviewed by the appropriate geographic area office, and the budget and contracts offices. Proposals may also be reviewed by the Agency's Office of General Counsel. Funding decisions are at the discretion of the Associate Director for Educational and Cultural Affairs. Final technical authority for grant awards resides with the USIA's contracting officer.

Review Criteria

Technically eligible applications will be reviewed according to the following criteria:

 Quality of the program plan and adherence of proposed activities to the criteria and conditions described above.

2. Reasonable, Feasible, and Flexible Objectives. Proposals should clearly demonstrate how the institution will meet the program's objectives and plan.

3. Multiplier Effect/Impact. Proposed programs should strengthen long-term mutual understanding, to include maximum sharing of information and establishment of long-term institutional and individual linkages.

4. Value to U.S.-Partner Country Relations. Assessments by USIA's geographic area desk, and overseas officers of the need, potential, impact and significance in the partner

5. Cost Effectiveness. The overhead and administrative components of grants, as well as salaries and honoraria, should be kept as low as possible. All other items should be necessary and appropriate. Proposals should maximize cost-sharing through other private sector support as well as institutional direct funding contributions.

6. Institutional Capacity. Proposed personnel and institutional resources should be adequate and appropriate to achieve the program or project's goals.

7. Institution's Track Record/Ability. Proposals should demonstrate potential for program excellence and/or track record of applicant institution. The Agency will consider the past performance of prior grantees and the demonstrated potential of new applicants.

8. Follow-on Activities. Proposals should provided a plan for continued follow-on activity (without USIA support) which insures that USIA supported programs are not isolated events.

Evaluation Plan. Proposals should provide a plan for evaluation by the grantee institution.

Notice

The terms and conditions published in this RFP are binding and may not be modified by any USIA representative. Explanatory information provided by the Agency that contradicts published language will not be binding. Issuance of the RFP does not constitute an award commitment on the part of the Government. Final awards cannot be made until funds have been fully appropriated by Congress, allocated and committed through internal USIA procedures.

Notification

All applicants will be notified of the results of the review process on or about April 1, 1993. Awarded grants will be subject to periodic reporting and evaluation requirements.

Dated: June 8, 1992.

William P. Glade,

Associate Director, Bureau of Educational and Cultural Affairs.

Sunshine Act Meetings

Federal Register

Vol. 57, No. 114

Friday, June 12, 1992

This section of the FEDERAL REGISTER contains notices of meetings published under the "Government in the Sunshine Act" (Pub. L. 94-409) 5 U.S.C. 552b(e)(3).

FEDERAL DEPOSIT INSURANCE CORPORATION

Notice of Agency Meeting

Pursuant to the provisions of the "Government in the Sunshine Act" (5 U.S.C. 552b), notice is hereby given that at 10:03 a.m. on Tuesday, June 9, 1992, the Board of Directors of the Federal Deposit Insurance Corporation met in closed session to consider the following matters:

Matters relating to a certain financial institution.

Matters relating to the probable failure of certain insured banks.

Administrative enforcement proceedings. Reports of the Office of Inspector General. Matters relating to the Corporation's corporate activities.

In calling the meeting, the Board determined, on motion of Director C.C. Hope, Jr. (Appointive), seconded by Director Stephen R. Steinbrink (Acting Comptroller of the Currency), concurred in by Vice Chairman Andrew C. Hove, Jr., Mr. Jonathan Fiechter, acting in the place and stead of Director T. Timothy Ryan, Jr. (Office of Thrift Supervision), and Chairman William Taylor, that Corporation business required its consideration of the matters on less than seven days' notice to the public; that no earlier notice of the meeting was practicable; that the public interest did not require consideration of the matters in a meeting open to public observation; and that the matters could be considered in a closed meeting by authority of subsections (c)(2), (c)(6), (c)(8), (c)(A)(ii), and (c)(9)(B) of the "Government in the Sunshine Act" (5 U.S.C. 552b(c)(2), (c)(6), (c)(8), (c)(9)(A)(ii), and (c)(9)(B)).

The meeting was held in the Board Room of the FDIC Building located at 550 - 17th Street, NW., Washington, DC.

Dated: June 9, 1992.

Federal Deposit Insurance Corporation.

Robert E. Feldman,

Deputy Executive Secretary.

SECURITIES AND EXCHANGE COMMISSION

Agency Meeting

Notice is hereby given, pursuant to the provisions of the Government in the Sunshine Act, Pub. L. 94-409, that the Securities and Exchange Commission will hold the following meeting during the week of June 15, 1992.

A closed meeting will be held on Tuesday, June 16, 1992, at 10:00 a.m.

Commissioners, Counsel to the Commissioners, the Secretary to the Commission, and recording secretaries will attend the closed meeting. Certain staff members who have an interest in the matters may also be present.

The General Counsel of the Commission, or his designee, has certified that, in his opinion, one or more of the exemptions set forth in 5 U.S.C. 552b(c) (4), (8), (9)(A) and (10) and 17 CFR 200.402(a) (4), (8), (9)(i) and (10), permit consideration of the scheduled matters at a closed meeting.

Commissioner Beese, as duty officer, voted to consider the items listed for the closed meeting in a closed session.

The subject matter of the closed meeting scheduled for Tuesday, June 16, 1992, at 10:00 a.m., will be:

Institution of injunctive actions. Institution of administrative proceedings of an enforcement nature.

Settlement of injunctive action.

Settlement of administrative proceedings of an enforcement nature.

At times, changes in Commission priorities requires alterations in the scheduling of meeting items. For further information and to ascertain what, if any, matters have been added, deleted or postponed, please contact: Bruce Rosenblum at (202) 272-2300.

Dated: June 10, 1992.

Jonathan G. Katz,

Secretary.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion in today's List of Public Laws.

Last List June 9, 1992

.... Order now !

For those of you who must keep informed about Presidential Proclamations and Executive Orders, there is a convenient reference source that will make researching these documents much easier.

Arranged by subject matter, this edition of the Codification contains proclamations and Executive orders that were issued or amended during the period April 13, 1945, through January 20, 1989, and which have a continuing effect on the public. For those documents that have been affected by other proclamations or Executive orders, the codified text presents the amended version. Therefore, a reader can use the Codification to determine the latest text of a document without having to "reconstruct" it through extensive research.

Special features include a comprehensive index and a table listing each proclamation and Executive order issued during the 1945–1989 period—along with any amendments—an indication of its current status, and, where applicable, its location in this volume.

The United States Government Manual 1991/92

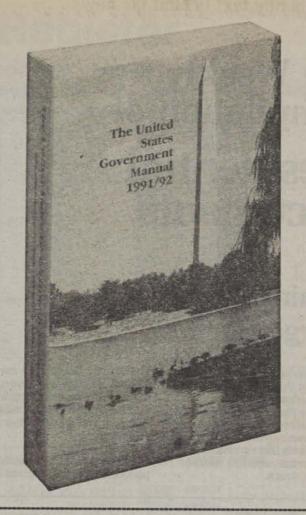

As the official handbook of the Federal Government, the Manual is the best source of information on the activities, functions, organization, and principal officials of the agencies of the legislative, judicial, and executive branches. It also includes information on quasi-official agencies and international organizations in which the United States participates.

Particularly helpful for those interested in where to go and who to see about a subject of particular concern is each agency's "Sources of Information" section, which provides addresses and telephone numbers for use in obtaining specifics on consumer activities, contracts and grants, employment, publications and films, and many other areas of citizen interest. The Manual also includes comprehensive name and agency/subject indexes.

Of significant historical interest is Appendix C, which lists the agencies and functions of the Federal Government abolished, transferred, or changed in name subsequent to March 4, 1933.

The Manual is published by the Office of the Federal Register, National Archives and Records Administration.

The authentic text behind the news . . .

The Weekly Compilation of

Presidential Documents

Administration of George Bush

This unique service provides up-to-date information on Presidential policies and announcements. It contains the full text of the President's public speeches, statements, messages to Congress, news conferences, personnel appointments and nominations, and other Presidential materials released by the White House.

The Weekly Compilation carries a Monday dateline and covers materials released during the preceding week. Each issue contains an Index of Contents and a Cumulative Index to Prior Issues.

Separate indexes are published periodically. Other features include

Weekly Compilation of

Presidential Documents

lists of acts approved by the President, nominations submitted to the Senate, a checklist of White House press releases, and a digest of other Presidential activities and White House announcements.

Published by the Office of the Federal Register, National Archives and Records Administration.

The Federal Register

Regulations appear as agency documents which are published daily in the Federal Register and codified annually in the Code of Federal Regulations

The Federal Register, published daily, is the official publication for notifying the public of proposed and final regulations. It is the tool for you to use to participate in the rulemaking process by commenting on the proposed regulations. And it keeps you up to date on the Federal regulations currently in effect.

Mailed monthly as part of a Federal Register subscription are: the LSA (List of CFR Sections Affected) which leads users of the Code of Federal Regulations to amendatory actions published in the daily Federal Register; and the cumulative Federal Register Index.

(Daytime phone including area code)

The Code of Federal Regulations (CFR) comprising approximately 196 volumes contains the annual codification of the final regulations printed in the Federal Register. Each of the 50 titles is updated annually.

Individual copies are separately priced. A price list of current CFR volumes appears both in the Federal Register each Monday and the monthly LSA (List of CFR Sections Affected). Price inquiries may be made to the Superintendent of Documents, or the Office of the Federal Register.

Occupational Safety and Health Administration

29 CFR Part 1910, et al. Air Contaminants; Proposed Rule

DEPARTMENT OF LABOR

Occupational Safety and Health Administration

29 CFR Parts 1910, 1915, 1917, 1918, 1926, 1928

[Docket No. H-020 A]

Air Contaminants

AGENCY: Occupational Safety and Health Administration (OSHA), Department of Labor.

ACTION: Proposed rule.

SUMMARY: The Occupational Safety and Health Administration (OSHA) proposes to amend its existing air contaminant standards that set permissible exposure limits (PELs) for the maritime, construction and agriculture industry sectors. The existing standards for maritime and construction are based on either the 1968 or 1970 "Threshold Limit Values of Airborne Contaminants" of the American Conference of Government Industrial Hygienists (ACGIH). There are no permissible exposure limits applicable to agricultural employees.

Since those ACGIH recommendations were compiled, there has been new research and many new substances have entered general use. As a result both ACGIH and the National Institute of Occupational Safety and Health (NIOSH) have recommended new or lower exposure limits for many

substances.

Based on those recommendations, on June 7, 1988 (53 FR 20960), OSHA proposed new exposure limits for general industry. After reviewing the record of a lengthy public hearing, many comments and extensive scientific data, OSHA issued on January 19, 1989 (54 FR 2332) new exposure limits for general industry. OSHA stated after reviewing feasibility data, it would propose the same new exposure limits for construction, maritime and agricultural employees.

In this notice of proposed rulemaking OSHA is proposing to issue more protective exposure limits for approximately 210 substances currently regulated in the construction and maritime industries and add new exposure limits for approximately 160 chemicals to protect these workers.

OSHA is also proposing that employees in agriculture be covered by these PELs as well as by approximately 220 additional limits which currently exist in general industry, maritime and construction, but do not exist for the agricultural industry. By appropriations act rider, only employees of farms with

more than 10 employees are covered by OSHA standards.

OSHA preliminarily concludes that the new or more protective limits will substantially reduce significant risk of material impairment of health for construction, maritime and agriculture workers and are technologically and economically feasible for those industries. Diseases reduced include heart disease, cancer, neurological disorders, lung, liver and kidney disease, eye disorders, moderate and severe irritation and other disorders.

The new standard will prevent approximately 8 to 13 deaths and 31,000

illnesses per year.

The proposed changes will be carried out for the maritime sectors by adding a new § 1915.1000 for shipyards, by adding new § 1917.1000 for marine terminals and by adding a new § 1918.1000 for longshoring along with necessary consequential amendments. For construction § 1926.55 will be revised and for agriculture a new § 1928.1000 will be added.

DATES: Written comments on the proposed standard must be postmarked on or before September 25, 1992. Notices of Intention to Appear at the informal rulemaking hearings on the proposed standard must be postmarked on or before September 11, 1992. Individuals who wish to comment or appear during the public hearings must see Section VIII of this document for specific

requirements.
Parties who request more than 10 minutes for their presentation at the informal public hearing and parties who will submit documentary evidence at the hearing must submit the full text of their testimony and all documentary evidence, postmarked on or before September 25, 1992. The informal rulemaking hearing is scheduled for October 20–30, 1992, in Washington, DC, for November 17–20, 1992 in San Diego, California, and on December 8–11, 1992 in Des Moines, Iowa.

ADDRESSES: Written comments should be submitted to OSHA Docket Office, Docket No. H-020A, room N-2634, U. S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210, telephone (202) 523-7894.

Notice of intention to appear, testimony and documentary evidence to be submitted at the hearing are to be sent to Mr. Tom Hall, OSHA Division of Consumer Affairs, Docket No. H–020A, room N–3647, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210, telephone (202) 523–8615.

The hearing will be held in Washington, DC in the Auditorium.

Frances Perkins Department of Labor Building, Third and Constitution Avenue NW. The informal public hearing will begin at 9:30 a.m. The hearing in San Diego will be held at the Holiday Inn on the Bay, 1355 North Harbor Drive, San Diego, California, 92101; Tel: (619) 232–3861. The hearing in Des Moines will be held at the Holiday Inn Des Moines, 1050 Sixth Ave., Des Moines, Iowa, 50314; Tel: (515) 283–0151.

FOR FURTHER INFORMATION CONTACT: Mr. James F. Foster, Director, Office of Information and Consumer Affairs, OSHA, U.S. Department of Labor, room N-3649, 200 Constitution Avenue NW., Washington, DC 20210, Telephone (202) 523-8151.

SUPPLEMENTARY INFORMATION:

Introduction and Organization of this Document

This Federal Register notice proposes to update the exposure limits for air contaminants in the construction, maritime and agriculture sectors. As a result there will be more protective limits for approximately 210 substances currently regulated in construction and maritime and new exposure limits for approximately 160 substances in these sectors. These new and more protective limits will also be made applicable to agriculture as will the approximately 220 limits already applicable to other sectors which have not been applied to agriculture. This notice then proposes to add to 29 CFR a new § 1915.1000 for shipyards, a new § 1917.1000 for marine terminals, a new § 1918.1000 for longshoring along with necessary conforming amendments. Section 1926.55 will be revised for construction and a new § 1928.1000 added for agriculture.

The first part of this document (Sections I, II and III of the preamble) discusses the approach, regulatory history and the general need for updated and new health standards in the construction, maritime and agricultural industries. It discusses the legal basis for this rulemaking and the background of the rulemaking which updated exposure limits for general industry (54 FR 2322-2982; January 19, 1989). Various tables are presented identifying the substances to be covered and the changes being proposed. At the beginning of this part of the preamble there are questions to assist the public in commenting on the proposal.

Next, (in Section IV) the preamble discusses the health effects of the substances which OSHA proposes to regulate. This begins with a general discussion of the principles of toxicology

and dose-response analysis. (See Section IV A and B.) The substances covered are divided into categories based on their health effects, e.g. narcotic effects, ocular effects, systemic toxicity. Each category of substances is reviewed in a separate subsection of Section IV. The discussion begins with a general overview of the relationship between toxic substances in that category and the illnesses or material impairments of health which they cause, followed by individual discussions of each substance in the category addressing illnesses or health impairments associated with each substance and the most important studies which demonstrate those effects.

Because OSHA's health discussions draw on the Air Contaminants rulemaking for General Industry, they cover the major studies in OSHA's view and in the views of participants who submitted comments to that rulemaking. In addition, the discussions incorporate or respond to the comments already made by the public in the general

industry rulemaking.

The health discussions in this preamble also incorporate newer studies (generally post 1987) which were not available prior to the general industry rulemaking and studies which may have specifically covered workers in the construction, maritime and agriculture sectors. Finally the individual discussions include OSHA's reasoning and preliminary conclusion that the new exposure limit is necessary to substantially reduce or eliminate a significant risk of material impairment of heath or functional capacity.

Section V of the preamble addresses the technologic and economic feasibility of the proposed exposure limits for the construction, maritime and agriculture sectors. A separate analysis is presented for shipyards, and for longshoring and marine terminals. This section also includes an estimate of the overall benefits for purposes of Executive Order 12291, and presents OSHA's preliminary conclusions on the technical and economic feasibility of the proposed new exposure limits.

This section of the preamble (V) then includes an analysis of the impact on small business under the Regulatory Flexibility Act. It also includes an environmental impact assessment.

Section VI contains the Clearance of Information Collection Requirements and the State Plan Applicability. Section VII of the preamble discusses the specific regulatory language for each sector. The regulatory changes are more complex for the maritime sector because of the need to integrate them with detailed existing provisions unique to

those sectors. This is followed, in Section VIII, by information on how the public can file written comments and participate in the oral public hearings. The hearing rules are discussed. Reference to authority under which the document was prepared is made in Section IX. The proposed regulatory text and tables are presented in Section X, followed by appendixes in Section XI.

OSHA's intention is that after this rule is completed, all employees under OSHA's jurisdiction will be covered by the PELs. If any subsector has not been evaluated and discussed by OSHA, it should assume that OSHA's intention is to cover it, and it should submit relevant comments.

I. Background

A. Need and Approach

There are 5 million workers in construction and 180,000 workers in the maritime industries who may be currently exposed to toxic substances which have no or inadequately protective exposure limits in these sectors. There are approximately 780,000 workers in agriculture under OSHA jurisdiction who may be exposed to some of the approximately 600 toxic chemicals which have protective exposure limits for workers in the general industry sectors. There are no protective exposure limits for these agricultural workers.

It is among OSHA's highest priorities to extend this needed health protection to all workers under OSHA's jurisdiction. All workers under OSHA's jurisdiction are equally important. The OSH Act states "The Congress declares it to be its purpose and policy * * * to assure so far as possible every working

man and woman in the nation safe and healthful working conditions * * *" (section (2)(b); emphasis added). OSHA estimates that accomplishing this goal will save 8 to 13 lives per year and prevent 31,000 illnesses annually.

In order to promulgate this rule efficiently and in a reasonable time, OSHA intends to utilize analyses previously conducted by OSHA and by other reputable scientific bodies. This information will be integrated with the latest available scientific and feasibility data.

OSHA believes the regulatory approach it has adopted is the best method for accomplishing the goal while meeting legal requirements and being consistent with good science.

The first step in the approach is to make use of the scientific work, public comment and experience gained during the Air Contaminants rulemaking for general industry. In that rulemaking, proposed June 7, 1988 (53 FR 20960) and issued January 19, 1989 (54 FR 2332), OSHA explained that it had issued more protective health standards for only 26 substances in its 18 years. However, there were many hundreds of toxic substances not covered by OSHA regulations and, in addition, many substances regulated by OSHA in its Ztables were covered by exposure limits that were considered inadequate by the scientific community. It was clear that OSHA needed a more systematic approach to regulation; it had to move beyond substance-by-substance rulemaking.

OSHA determined that setting new exposures limits for a large number of toxic substances was of higher priority for protecting workers than promulgating a few standards with complete ancillary provisions (e.g., medical surveillance, exposure monitoring). It concluded that making use of the existing scientific work of the National Institute for Occupational Safety and Health (NIOSH) and the American Conference of Government Industrial Hygienists (ACGIH) as a starting point in OSHA's analysis, would expedite the regulatory process while still insuring that health decisions were based on sound science.

In developing and promulgating its
General Industry Air Contaminants rule,
OSHA reviewed the existing literature
on control technology and its costs,
engaged in a massive survey of 5700
firms in industry, reviewed
approximately 1500 public comments
and more than 2000 scientific studies,
and held extensive public hearings.
Consequently, its final decisions were
based on full public input and complied
with required rulemaking procedures.

See discussions at 53 FR 20962–67, 20977–81 and 54 FR 2333–39, 2361–2383 for an extended discussion of OSHA's approach.

OSHA determined that it would be most effective to extend the new exposure limits to the construction, maritime, and agriculture sectors in a second rulemaking. This would permit OSHA to consult with the Construction Advisory Committee and the Shipyard Advisory Committee, to meet with representatives of the longshore and marine terminal sectors, and to make presentations to and have meetings with the agriculture community. In addition, it would give OSHA the time and resources to extensively analyze feasibility for these sectors. See 54 FR 2383. OSHA has completed its advisory committee consultations and economic analyses.

In addition, OSHA will consult with the Departments of Transportation and Agriculture, the Environmental Protection Agency, the Small Business Administration, and the Office of Science and Technology Policy regarding the extension of revised exposure limits to these three major industry sectors, and to small businesses within each sector.

OSHA is only opening the record for construction and maritime for the 376 substances where it concluded new or changed limits were appropriate in general industry. For each substance OSHA is proposing the exposure limit it concluded was appropriate in the 1989 General Industry rulemaking, which was determined after extensive review of scientific literature and public comments.

In addition, OSHA is opening the record for consideration of exposure limits for fiberglass, mineral wool and asphalt for construction, maritime, agriculture and general industry. OSHA did not reach final conclusions on these substances in the general industry rulemaking.

There are a few substances where OSHA has issued substance specific standards for general industry (in 29 CFR 1910.1001–1048), but has not made the exposure limit applicable to construction or maritime. These include lead for construction and cotton dust for both construction and maritime. OSHA is proposing to apply the exposure limit from the substance specific general industry standard to construction and maritime (but not the ancillary provisions which are not being considered in this rulemaking).

There are no exposure limits applicable to agriculture. OSHA believes that the Act, the need for health protection and good health policy all

require that agricultural workers should be protected from the effects of toxic chemicals. (By appropriations rider, OSHA cannot issue or enforce regulations on agricultural operations with no more than 10 employees.) Accordingly, OSHA is proposing that agricultural workers be protected by all the exposure limits applicable to workers in other sectors. This includes exposure limits for the 376 substances being covered for construction and maritime, the approximately 220 substances already applicable to other workers, and the substances regulated with single-substance standards.

OSHA wishes to make it absolutely clear that it is considering the group of 220 substances only for agriculture. Opening the record for other sectors would excessively delay this rulemaking and workers already have protection in the other sectors.

In addition, OSHA is not opening the record of the 376 substances for general industry, and will not consider those substances for general industry. OSHA has just completed a review of all of these substances for general industry and it would be inappropriate to review them so shortly after full consideration. The only substances being considered for general industry are fibrous glass, mineral wool and asphalt fumes.

OSHA is not opening the record or considering any comments on ancillary provisions such as medical surveillance and exposure monitoring in this rulemaking. OSHA has already commenced consideration of whether to issue general exposure monitoring and medical surveillance provisions. Advanced notices of proposed rulemaking have been issued, and a major study is in process on medical surveillance. These matters are in the published regulatory agenda as separate rulemakings. It would unnecessarily delay this rulemaking and exposure limit protection for construction, agriculture and maritime workers to attempt to consider ancillary provisions in this rulemaking.

Table I-F lists the substances being considered for each sector and for the maritime subsectors.

In the future OSHA intends to update its Air Contaminant exposure limits at approximately 3 to 5 year intervals. These updates will consider changes to existing limits and inclusion of new substances. They will cover all sectors and workers within OSHA's jurisdiction. This process is listed in the published regulatory agenda. These updates are a more appropriate forum to consider, across the board, changes in current general industry exposure limits.

OSHA concludes, based on its expertise and experience, that this approach to air contaminant regulation is the best method for increasing health protection for all American workers in a reasonable time. As discussed below in the Legal Authority section, OSHA concludes this approach is legal. OSHA will continue to engage in single substance rulemakings as appropriate.

Technical Matters

OSHA is not considering in this rulemaking the 13 substances (29 CFR 1910.1003-16) for which it has work practices but no exposure limits. This rulemaking is designated to cover exposure limits. It is also not considering nine substances currently involved in ongoing single substance rulemakings. OSHA has already completed extensive consideration of these substances in those rulemakings, and it would be wasteful of resources to reconsider them here. It is also not considering a few substances for agriculture (e.g., coke oven emissions) which have absolutely no relevance in that sector.

OSHA will consider in the first future update and not this rulemaking, different limits for the four substances that it has committed to reconsider in response to the legal challenge brought by the AFL/CIO to the General Industry rule. These substances are carbon tetrachloride, vinyl bromide, trichloroethylene and gasoline. It will also reconsider the four substances it agreed to reconsider pursuant to settlement agreements reached with industry. These are nitroglycerin and ethylene glycol dinitrate for the civilian explosives industry and calcium oxide and hydroxide. The first update is a better forum because all industry sectors can be efficiently considered at one time.

Existing exposure limits vary among industry sectors. The existing limits for General Industry, Longshoring and Marine Terminals are based on the 1971 OSHA PELs, which were originally based on the 1968 ACGIH TLVs. The existing limits for Construction and Shipyards are based on the 1970 ACGIH TLVs. (See also the Legal Authority discussion on Shipyards for a further analysis). There are no existing limits for Agriculture. The Transitional Limits in the proposed Z-Tables are the existing limits for each sector, and vary accordingly. The Transitional Limits are effective until the new limits are phased in.

A few of the 376 substances changed for general industry are not being opened for consideration for Construction and Shipyards because the 1970 TLVs (the current construction PELs) already included the change which OSHA adopted in 1989 for General Industry.

Also, OSHA is not opening the record for Construction and Maritime for consideration of the 52 substances it considered but determined not to change for General Industry. It would be an inefficient use of resources to reopen in this proceeding substances for which OSHA so recently concluded, based on a full rulemaking record, that change was inappropriate at that time.

OSHA has attempted to make the tables of exposure limits for Shipvards. Marine Terminals & Longshoring, Construction and Agriculture as useful as possible. In keeping with its practice for General Industry, there will be a Table Z, Construction; a Table Z, Shipyards; a Table Z, Longshoring & Marine Terminals; and a Table Z, Agriculture. However, there will be only one Table Z for each sector, in contrast to the three for General Industry; Table Z-1-A, Z-2 and Z-3. General industry has 3 Tables because (1) Table Z-2 is based on ANSI standards, which utilize a different definition of ceiling than does ACGIH or OSHA. (The Z-2 definition of maximum peak is somewhat similar to OSHA's concept of a STEL.) And (2) Table Z-3 presents mineral dust limits, some of which are formulas, not specific numbers.

OSHA believes that a single table, with the same concepts and specific numbers rather than complex formulae will be easier for the public to use, understand and comply with.

Accordingly OSHA is, where necessary for Table Z-2 substances, utilizing the Peak levels as STELs and not incorporating the ceilings. In addition, formulas are being converted to the nearest gravimetric measurement (weight per unit volume).

OSHA believes these slight adjustments are in the nature of technical changes and make no substantive difference in either health or feasibility. OSHA intends to make similar changes for General Industry as technical amendments in the future to achieve uniformity and consistency across all sectors regulated by OSHA.

The new Z-Tables list all substances for which OSHA has exposure limits, including those substances where there are single substance standards with ancillary provisions that are applicable. These substances will be footnoted or textual cross referenced indicating where the ancillary provisions are located. This will make it easier for the public to determine whether a substance is regulated by OSHA, what the

exposure limit is, and whether there are ancillary provisions.

Approximately 100 substances listed in the Z-Tables are registered pesticides regulated by EPA. Where an agricultural employer uses any registered pesticide in accordance with the EPA label, OSHA has no jurisdiction pursuant to section (4)(b)(1) of the OSH Act. If the substance is used for non-pesticide purposes or the agricultural employer makes the substance and it is not labelled, then the OSHA exposure limit applies. See the discussion under Legal Authority.

B. Comments Solicited from Interested Parties

OSHA requests comments on all issues raised by this proposal including health effects, feasibility, risk and policy issues. The following are some specific questions which may assist interested parties in preparing their comments. If a commenter has data in a less detailed form than OSHA requests or just partial information to some questions, the information would still be useful to OSHA, and the commenter is requested to submit the data or information in whatever form it exists.

"Risk-Risk Analysis"

OSHA has preliminarily concluded that this standard could prevent approximately 8 to 13 deaths and 31,000 illnesses per year. See also, the "Economic Impacts" section of the PRIA below, V-B (Construction), V-C (Maritime), V-D (Agriculture), V-E (General Industry) for further information on OSHA's preliminary economic impact estimates. OSHA notes that these benefit estimates may change pending consideration of public comments about this proposed rule and the consideration of the issues raised by OMB

OMB requested that OSHA consider "[h]ow will compliance with the proposed PEL rule affect workers' employment, wages, and therefore health?" OMB asked OSHA to assess comprehensively whether the net health benefit of this rule to workers is positive or negative. The objective of OMB'S request is to weigh the risks to workers from exposure to toxic substances regulated under the rule with the health risks posed to those same workers if compliance with the proposal lowers their incomes or employment levels. OMB asked OSHA to give serious thought to this kind of analysis to determine, in our judgement, if the arguments raised by OMB were valid, and to consider sponsoring additional empirical work in the future.

OMB has requested that the Department study this issue and section 3(a) of Executive Order 12291, states "each agency shall, in connection with every major rule, prepare, and to the extent permitted by law consider, a Regulatory Impact Analysis." If the type of analysis suggested by OMB is able to generate a clearer picture of the total benefits provided workers by regulatory proposals, then the Agency and the public will be better informed of the likely impact of the regulations. We clearly recognize, however, that information generated by any study can be used by OSHA only in accordance with the OSH Act and controlling case law. See the "Pertinent Legal Authority" section, infra, at Section II. The information needs to be relevant to analyzing whether workers are at significant risk of material impairment of health or whether compliance with the rules is feasible for it to be legally relevant to OSHA's decisions regarding the PELs.

The Department has thus agreed to study the questions raised by OMB, to the extent applicable to worker health, and will consider whether weighing the risks to workers' from exposures to toxic substances with the risks associated with lowering those same workers' incomes is appropriate and relevant. OSHA will consider the issue while simultaneously moving forward with the rulemaking.

To assist OSHA is assessing the issues raised by OMB, OSHA is soliciting comments on the following questions and on any other information that the commentator believes will assist OSHA in meeting its statutory obligations.

- 1. What are the advantages and disadvantages of introducing "risk-risk" analysis into this rule? Specifically, has the methodology been tested and verified?
- 2. What is the validity of the suggested economic analysis proposed by OMB?
- 3. How valid is the issue OMB raises with respect to the linkage between income and health?
- 4. How valid is the issue OMB raises with respect to the linkage between the costs of regulation and workers' incomes?
- 5. Can one empirically estimate the impact of the cost of a regulation on the incomes of the same workers?
- 6. Comment is requested on all aspects of whether any such analysis should consider indirect effects only on workers covered by the rule, or those effects on all workers covered by the OSH Act?

7. What general equilibrium considerations, if any, would need to be taken into account in performing such an analysis?

8. What macro-economic considerations, if any, would need to be taken into account in performing such an analysis?

9. Are there any methodological issues, not covered by the above questions, with the suggested economic analysis proposed by OMB?

To contribute to OSHA's effort to examine whether the estimated health benefits of this rule to workers are positive or negative, OSHA solicits public comment on concerns raised by OMB. Specifically, commenters should describe whether there are modelling techniques, data sources, or parameter estimates which provide accurate and unbiased estimates of two key relationships associated with this question: (1) The relationship between OSHA regulations (or this rule in particular) and measures of workers' economic welfare such as financial wealth, income, wages and employment status; (2) The relationship between these measures of workers' economic welfare and measures of health status such as mortality.

Regarding the relationship, if any, between regulatory compliance and changes in workers' economic welfare. commenters may discuss whether this rule is likely to affect workers' real income, employment, and/or productivity. Estimates of potential employment and wage effects due to OSHA regulations in general would also be helpful in this analysis. Most useful in such analysis would be data describing what changes in workers' economic welfare could occur in the industries affected by this rulemaking. Comments may include retrospective analyses of the effect of past OSHA regulations on workers' economic welfare, and discussions of why this rule's effects may be similar or different. Alternatively, commenters may offer prospective analyses of the effects of this rule. All comments should justify the underlying assumptions about key parameters in the analysis. Finally, commenters may discuss whether and how particular changes in variables such as employment or wages are in fact attributable to the rule.

Regarding the relationship, if any, between workers' economic welfare and their health status, OMB is interested in OSHA obtaining information on any research or studies which examine the positive relationship between income and health status. A preliminary review of the literature points to several studies which estimate the size of this income/

health relationship. OMB is interested in OSHA obtaining information on all aspects of these studies, including the quality of their estimates and their applicability to the employment context. OMB is interested in OSHA obtaining information about the accuracy of these estimates and the existence of a relationship. This list is not comprehensive, and commenters are encouraged to submit any additional data or studies. Comments which consider international data on how incomes and health, or mortality, vary either over time or across countries are also invited.

OMB has provided OSHA with a summary and analysis of research which OMB cited as relevant to the questions it raised above regarding this proposed rule. OSHA solicits public comment on this research and on the questions raised by OMB to the extent relevant under the OSH Act to workers' health. OMB's summary and analysis of this research is listed as follows.

OMB Summary and Analysis of Selected Studies on Income and Health

The most careful large sample studies by Anderson and Burkhauser, by Duleep, and by Wolfson et al., seem to suggest that losses in wages in the range of \$1.9 to \$8.5 million dollars annually are associated with one additional fatality annually. Although causality is not proven, an association between income and mortality persists after controlling for prior health status, for educational attainment, and for exposure to quantifiable occupational risks. Further, the association exists, although more weakly, at high income levels. Although most of the more careful studies focus on wages and worker mortality, the general effect that they are trying to measure is the relation between real income broadly defined, and health status of the family.

Several studies are summarized in the following table. To facilitate comparisons of the results of the various studies, the table includes estimates of the income gain necessary to avert one fatality. These estimates of "willingnessto-spend", which are calculated from the effect of income on mortality reported in the papers, are intended to be illustrative and not definitive. As the effect of income on mortality is likely to depend on age, income, and number of years of observations, estimates of willingness-to-spend to save a statistical life similarly depend on these variables. Differences among studies in the estimated willingness to spend depend in part on differences in the means and distributions of the age of respondents,

their income, and the number of years over which mortality was observed.

Among the studies is a commonly cited one by Ralph Keeney (1990), who estimated that under a particular set of assumptions, regulatory costs equal to \$7.25 million could induce one fatality. His estimate is based in part on correlations between income and mortality reported in Kitagawa and Hauser (1973), who used 1960 Census data and matched death certificates for the 4 months following the month of the Census.

Another commonly cited study is More Medical Care, Better Health: An Economic Analysis of Mortality Rates, (1982) by Jack Hadley, Co-Director of Community and Family Medicine, Georgetown University. Hadley showed that increase in total family income of 1% were associated with statistically significant declines in mortality of 0.07% for white males between 45 and 64, and of 0.116% for black males between 45 and 64.1 He used aggregate crosssectional data for 400 county groups for 1970, and focused on mortality rates by age group, by sex and by race. Income effects were also large for white and black infants of both sexes. For some groups, e.g., black females, increases in income were associated with increases in mortality, but these were not statistically significantly different from

Aggregate cross-sectional analyses, of which Hadley's study is a well-known example, tend to suffer from several well-known difficulties. First, measurement error in the explanatory variables due to the misclassification of data is likely to bias the estimates towards zero. Measurement error may result because current family income is a poor proxy for permanent income with which current mortality should correlate, and because decedents may have crossed county lines prior to death. The failure to correct for geographic variations in the cost of living also introduces measurement error. Second, since income effects on mortality are estimated separately for different subgroups of the populations, e.g., men, the estimated effect likely understates the overall effect of income changes on mortality. In fact the true effect of total family income on mortality may be the sum of the income effects for each subgroup making up a family. Finally, since healthier populations that have lower mortality can work harder and earn more, the estimated elasticity may be

A 1984 study of the Joint Economic Committee (IEC) of Congress entitled "Estimating the Effects of Economic Change on National Health and Social Well-Being" reports that the 3% decline in real per capita income below trend during the 1973 recession is associated with a 3% increase in total mortality. Written by M. Harvey Brenner of Johns Hopkins University, the report examines relationships between economic variables such as changes in income, and unemployment, and indicators of social well-being, including mortality rates. Applying the reported relationships to today's economy implies that a decline in per capita income of 3%, or about \$690 per capita would result in an increase in mortality of 3%, or about 65,000 premature deaths. A decline in income of between \$1.8 million and \$2.7 million would thus be associated with one death.3

The estimate by the JEC may be an overstatement of the long-run effect of income on health, since it reflects the effects of transitional income changes. Such income changes are likely to be associated with changes in mortality greater than those caused by permanent changes in income, since the former are associated with more stress than the latter.

Kathryn Anderson and Richard Burkhauser showed that an increase in wages of \$1.00 (17%) implies a 4.2% decline in mortality risk over the next 10 years, (p. 321).4 Their study, published in 1985 in the Journal of Human Resources, used 10 years of mortality data from 4878 male workers aged 58 to 63, to analyze the joint determination of health and retirement from the labor force. A decline in mortality risk of 4.2%, given their sample amounts to 200 fewer deaths over the 10 years, or approximately 20 fewer deaths per year. Thus an increase in wages of \$1.00 per hour for the 4878 workers is expected to prevent 20 deaths annually. If workers are paid for 2080 hours annually, then the annual wage gain necessary to avert one death is approximately \$510,000 in 1969 dollars. Using the Consumer Price Index to adjust for inflation implies that an increase in wages of \$1.9 million would prevent one premature fatality.

Anderson and Burkhauser's study also implies that an increase of \$10,000 in the value of worker's homes lowered the risk of death by 0.79%, and prevented 3.8 deaths annually. To translate these changes in the stock of wealth to changes in income flows, note that the annualized equivalent of \$10,000 is \$890 annually, if borrowed at mortgage rates of 8% for 30 years. Thus gains in income of \$4.3 million (4878×\$890 of additional income annually) are associated with 3.8 fewer deaths. Using the Consumer Price Index to convert these 1969 dollars to current dollars implies that a gain in income of \$4.3 million should be associated with one averted death.

Several qualifications are necessary before interpreting the Anderson and Burkhauser results in this manner. Analyses on the mortality of older persons may underestimate the effect of income on mortality if low income people have already died at younger ages. Finally, as mentioned by Duleep, (1986), income's effect on mortality is dependent on the extent to which death is preventable. At older ages the income effect falls as death becomes unavoidable.

Harriet Duleep, using a sample of 9618 white married men showed that earnings of less than \$3000 instead of more than \$9000 have a direct effect on the probability of death by age fifty, of 0.089, and an indirect effect, (through the probability of becoming disabled), of 0.028, for a total effect of 0.117. Her study, published in 1986 in the Journal of Human Resources used data on earnings, disability, and mortality of men aged 35 to 64 to estimate the effects of earnings on mortality. Her analysis held constant educational achievement, corrected for the reverse causality of health on income by controlling for whether the workers were initially disabled, and used sophisticated statistical methods. Although Duleep's

exaggerated by failing to correct for reverse causality.²

² Taking Hadley's estimate of 0.07% for the elasticity of middle-aged male mortality with respect to income implies that an income loss of \$38 million is necessary to induce one fatality. This figure, which is higher than those mentioned below, is calculated by dividing a hypothetical 1% decline in US GNP, (57 billion), by 1500 deaths, the 0.07% increase in mortality that is predicted to occur by applying Hadley's elasticity estimate to U.S. mortality. Since lower elasticity estimates result in larger required income losses to induce one fatality, the fact that the \$38 million estimate seems high may be ascribed to the various factors that appear to lower the estimated elasticity.

³The higher figure from applying the elasticity of unity to 1991 income and mortality data. In particular, a 1% decline in current GNP is a loss of about \$57 billion, and this would be associated with a 1% rise in mortality, or about 21,000 premature deaths. Thus the dollar losses necessary to induce one fatality equal approximately \$2.7 million, (2,700,00 = \$57 billion/21,000). The lower follows from applying the elasticity to 1975 data, and inflating to current dollars.

^{*}The coefficient from their logit analysis is -.21, while the probability of death in their sample is .28. Applying the formula to interpret logit coefficients found on p. 791 of Judge et.al (1988) gives 4.2% as an estimate of the change in the risk of death attributable to an additional dollar of hourly wage income.

¹ See Hadley, p. 112.

work seems to suggest that the observed relation may be causal, the effect of income on mortality is significant only in the lower income categories. For workers with earning greater than the mean, the effect of income on mortality is insignificantly different from zero. Her other key findings include the following:

(1) Having earnings of less than \$3000, instead of more than \$9000, raises the probability of becoming disabled between ages 25 and 35 by 8 percentage points, and the probability of becoming disabled between the ages of 25 and 50 by about 26 percentage points.

(2) "The probability of death (during a six year period) for a 50 year-old man in the lowest earnings category with a high school education is more than twice as high as for his counterpart in the highest earnings category." (See p. 242)

To estimate the wage increases

To estimate the wage increases—
necessary to avert one fatality, first note
that an increase in wages to between
\$6000 and \$9000 from between \$3,000
and \$6,000 lowers mortality risk by 0.023
over the six years, or by about 0.0038
over one year, assuming that the
incremental risk is uniformly distributed
over the period.⁵

On average, raising annual wages by \$3000 for each of 264 workers currently earning between \$3000 and \$6000 would avert one fatality per year, (.38% × 264 = 1). Converting these figures to current 1992 dollars, a rise in wages of \$2.5 million is on average associated with one averted fatality annually.

Duleep (1989), found that income was significantly related to mortality throughout six income levels. In particular, mortality was higher for men with annual incomes between \$38,000 and \$47,000, (in 1992 dollars), than for similar men with incomes above \$47,000. The effect of income on mortality was stronger in the lower income ranges than in the higher income ranges. Comparing the third and fourth income categories, her results imply that an increase in income of \$6.5 million annually is associated with one less fatality per year. Her study covered 13,954 white married men aged 25 to 64 during the years 1973 to 1978. Comparing the relationship between mortality and income with the findings of Kitagawa and Hauser who used 1980 data, she found an apparent lack of improvement in the relative mortality experience of low income men.

In a more recent paper, Duleep (1991) investigates whether low income is associated with higher mortality because poorly paid workers face higher occupational risks to health and safety.

Thus it appears that the effect of low income on mortality is not a consequence of lower paid workers being exposed to greater on the job hazards.

Wolfson, et al., in a forthcoming article in the Journal of Gerontology, show that income effects on mortality of 500,000 older Canadian males exist even between the highest and second highest income quintiles. Since all Canadians had access to public health care during the sample period, it appears that access to medical care is not the key mechanism linking income to mortality. Wolfson et al., show that the mortality risk of the married males retiring at age 65 with incomes in the 95th percentile is only 0.86 of the risk for the similar males with median average earnings. Given that the risk of death by age 70 is about 0.15 for married males with median income, a relative risk of 0.86 implies that an increase in income from the median to the 95th percentile is associated with declines in mortality of about 2%. To express this in terms of dollars per life, note that an increase in income from the median to the 95th percentile is about 25,000 Canadian dollars annually. Converting to U.S. dollars, and adjusting for inflation, this amounts to \$24,000 1991 U.S. dollars. An increase in incomes by this amount for married workers close to 85 would decrease mortality by two percentage points. Thus increases of \$24,000 per year for each of 50 such workers earning the median income would be expected to avert one fatality during the years when these workers are age 65 to 70. Increase in income of \$24,000 per year

for each of 250 workers (\$6 million in total) would thus be expected to avert one fatality per year, assuming for simplicity that the fatalities are uniformly distributed over the years in question. Wolfson concludes that "the results cast doubt on the primacy of causal explanations such as reverse causality and health selection".

The National Institutes of Health of the U.S. Department of Health and Human Services has studied extensively the relation between mortality and various demographic, social and economic factors.7 They report that higher incomes are associated with lower mortality in the vast majority of the many cohorts that they considered. Using a follow-up study of one million Americans over the 3 years from 1979 to 1981, they calculate simple correlations between mortality and family income, for particular age, sex, and race cohorts. Their study does not use multiple regression techniques that might control for reversal causality by including important variables such as prior health status. They also do not control for education while considering the effects of income on mortality. They find, for example, that the mortality rates for white males aged 25-34 with family incomes of between \$5,000 and \$9,999 annually were 28% higher than for all whites in this age group. For white males aged 25-34 with family incomes between \$25,000 and \$49,999, mortality rates were only 57% as high as for all white males in this age group. Similarly, for black females aged 55-64 with family incomes of \$5,000 to \$9,999 females in this age group. For black females aged from 55-64 with family incomes of \$5,000 to \$9,999 annually, mortality rates were 8% higher than for all black females in this age group. For black females aged from 55-64 with family incomes of \$25,000 to \$49,999 annually, mortality rates were 46% as high as for all black females in this age group. Similar patterns between family income and mortality seem to exist for most cohorts.

These data permit a rough estimate of the income gains necessary to avert one death. Focusing on white males age 35–44, increasing income from the \$15,000 to \$19,999 category to the \$20,000 to \$24,999 category lowers mortality rates over the three years from .45% to .38%. Thus the decline in mortality rates is about 0.023% per year. Shifting 10,000 families from the low income category to the

Using information from the National Occupational Hazards Survey on the distribution of potential employee exposures to chemical substances and physical hazards, she found that each of six different measures of occupational hazard has only statistically insignificant effects on mortality. Furthermore, the effects of income on mortality are changed only slightly when occupational hazards are controlled for. Her results indicate that wage gains of \$3.9 million in current dollars are associated with one less premature fatality.6

⁸ This estimate is defived by considering the effect of a change in income from the category of \$3.000-\$5,999 to the category \$5.000-\$8,999, as reported in the first column of Duleep's Table 1. Applying again the formula for interpreting logit coefficients found on p. 791 of Judge et al., implies that the decline in the risk of mortality is 1.0% over the 6 years. Taking one sixth of this change as the annual effect implies that annual income gains of \$1.1 million would be associated with one less mortality annually. Expressed in current dollars a gain of \$3.8 million in workers income in this income range would reduce mortality by one.

⁵ See Table 1, column 5 in Duleep (1988).

⁷ National Institutes of Health, A Mortality Study of One Million Persons: by Demographic Social, and Economic Factors: 1979–1981 Follow-up First Data Book, U.S. National Longitudinal Mortality Study,

higher income category would save on average 2.3 adult male lives per year. Improvements in income sufficient to shift families from the \$15,000 to \$19,999 category to the \$20,000 to \$24,999 category would also lower the death rates for other family members. For girls aged less than 15 it would fall by .028%, for boys aged less than 15 it would decline by 0.026%, while for women aged 35-44 it would fall by 0.09%. Thus shifting 10,000 families all composed of two parents, one boy and one girl,

would reduce mortality by 17 lives. Since improvements in income would range from \$1 to \$10,000 we take \$5,000 as the midpoint. Thus income gains of \$50,000,000 save 17 lives. Converting from 1980 dollars to current dollars using the Consumer Price Index gives \$4.9 million per life. Although this estimate considers the relation between family income and family mortality, it does so only over a short period, (3 years), without controlling for education, or prior health status.

All these studies estimate imperfectly the effect of income on mortality. Since these studies, with the exception of the NIH report, consider only the association between wage earnings and mortality of the individual, (or of the worker), rather than the relation between family income and mortality of family members, they tend to underestimate the relationship between family income and mortality generally, including that of all family members.

SUMMARY OF SELECTED STUDIES ON INCOME AND HEALTH

Study	Data	Implicit income gains necessary to avert one death (millions)	Comments		
Keeny (1990)	Used income and mortality correlations form Kitagawa and Hauser, (1960) data, and others.	\$7.25	Cited in UAW v. OSHA.		
Hadley (1982)	400 counties, family income and county- wide mortality rates.	\$38	ment error may exaggerate estimate.		
Joint Economic Committee (1984)	Aggregate U.S. income, employment, mor- tality, and morbidity; 1950–1980.	\$1.8 to 2.7	Reflects income loss from recession of 1974-75.		
Anderson and Burkhauser (1985)	4878 male workers over 10 years, 1969– 1979.	\$1.9 (wages) \$4.3 (other income)	Older workers aged 58-63. Measured ef- tects of wages and of value of one's home on mortality.		
Duleep (1986)	9618 white married male workers age 35- 64 over 6 years, 1973-1978.	\$2.6	Controls for prior disability, and educational attainment.		
Duleep (1989)	13,954 white married male workers aged 25-64 over 6 years, 1973-1978.	\$6.5			
Duleep (1991)	9618 white married male workers aged 35- 64 over 6 years, 1973-1978.	\$3.9	Same as above. Also corrects for expo- sure to occupational hazards.		
Wolfson (1992)	500,000 Canadian workers, over 10-20 years.	\$6	Investigates longevity rather than mortality. Finds Income effects at highest quintiles of income.		
National Institutes of Health (1988)	1,000,000 Americans, all ages, 1979-1981	\$4.9

Additional Questions for Public Comment

General (Apply to Construction, Maritime & Agriculture)

1. Are there any exposures to substances considered in this rulemaking other than those identified by OSHA? If so, which activities? Which substances? How many employees are exposed? To what exposure levels? What controls are used?

2. Please submit any additional exposure monitoring data to supplement the data OSHA already has. If possible, the results should be accompanied by a

description of the activity and any controls used.

3. Is there information regarding laboratory analytical procedures which may be used in lieu of those suggested by OSHA to determine exposure to air contaminants?

4. Are there any circumstances in which the proposed changes in PELs would have significant impacts beyond those identified by OSHA?

5. What controls are available to reduce exposures below existing levels in addition to those identified by OSHA, and what are the estimated costs associated with these controls?

6. OSHA requests comments on all aspects of and approaches to the regulation of fibrous glass, including refractory ceramic fibers, and mineral wool. This includes the scientific evidence on nonmalignant respiratory disease, carcinogenicity, and irritant effects, feasibility data, and various approaches to regulation based on these factors.

7. OSHA's proposed final limit for silica is based on gravimetric measurement. The 1970 TLV for silica is measured in m.p.p.c.f. (millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques). Should OSHA convert this sampling methodology to the more commonly utilized gravimetric measurement of mg/m3, for the purpose of listing in the transitional table of the final rule on the effective date of the final rule? The advantages of using gravimetric measurement will occur sooner and OSHA does not foresee feasibility problems as this is the common practice.

8. Comments are requested on all aspects of the regulation of asphalt fumes including issues as to its respiratory effects and carcinogenicity, and other issues relating to its regulation.

9. A risk assessment for asphalt fumes is presented based on the Hanson study. There is scientific disagreement on whether the exposed employees were exposed significantly to coal tar pitch as well as asphalt as discussed in the preamble. Is this study appropriate for risk assessment? Is the quantitative risk assessment methodology used appropriate? Have there been any other quantitative risk assessments conducted for asphalt fumes? If so, OSHA requests all relevant information.

10. OSHA proposed that the PEL for asphalt fumes be measured and expressed as total particulate. Another view is that use of the "benzene-soluble fraction" is more appropriate. OSHA solicits comments on this issue.

11. OSHA is proposing effective dates of 8 months for compliance with any means of engineering, word practice controls, and personal protective equipment, and 4 years for engineering controls for longshoring and marine terminals. For agriculture the first date is 1 year and the second is 4 years. For shipyards and construction the dates are 3 months and 4 years based in part on the Advisory Committee recommendations. Are these dates appropriate? Should they be longer or shorter?

12. Based on the assumption that a 1 percent excess mortality rate among workers in the construction industry would result from non-compliance with the proposed PELs, OSHA has estimated that 8 to 13 extra deaths per year would occur without this rule (see PRIA, V-2). OSHA requests comment on this assessment methodology, especially data which confirm or deny the assumed excess mortality rate.

13. In assessing the number of illnesses that would occur in the absence of this regulation, OSHA has assumed that BLS illness estimates for this industry are under-reported by a factor of five (See PRIA, V-2B). OSHA requests comment on this estimate, especially data which confirm or deny the magnitude of any under-reporting in reported illness statistics.

14. OSHA preliminarily concludes that the proposed PELs are economically and technologically feasible for all sectors. OSHA requests comments on the technological and economic feasibility of attaining these PELs in industry sector where working conditions may be different from those in general industry. Commenters may address feasibility issues on an industry or sub-industry

15. In order to assess the benefits associated with this rulemaking, OSHA has preliminarily projected that the proposed PELs will cause an 80 percent reduction in the incidence of occupationally related illnesses (see PRIA). OSHA requests comments about whether an eighty percent effectiveness rate is a reasonable estimate of the rule's efficacy.

Construction

1. In the process of estimating risk to workers, OSHA has estimated the extent of exposures in the construction industry as the number of full-time equivalent employees exposed (See PRIA, page VB-58). This is to say that the total risk of 100 workers exposed above the PEL full-time is equivalent to the risk to 1000 workers each exposed for one-tenth the time. OSHA requests comments on the validity of this

assumption and on all other aspects of converting exposure estimates into risk estimates. Should strict linearity be assumed?

Maritime

1. OSHA has some data on what percentage of workers currently wear respirators. Additional data on what percentage of tank cleaners, welders and painters currently wear personal protective equipment, including respirators, and on what percentage of other occupational groups wear personal protective equipment, including respirators is requested.

2. The use of "real time" measurements may be useful in tank cleaning and other confined space entry situations. Identify methods or instruments used for making "real time" measurements, in addition to those identified by OSHA. How accurate are these methods? What costs are involved?

3. Ship repairing and shipbreaking reference the 1970 ACGIH TLVs. Ship building references OSHA's Z-1 Table. OSHA proposes that, as of the effective date of the standard, all of the previously mentioned subgroups within the maritime sector utilize the 1970 TLVs as transitional limits. This will facilitate conversion to the same levels for these groups and provide consistency. The Shipyard Employment Standards Advisory Committee generally supports this proposal. OSHA also solicits comments from other interested members of the public.

Agriculture

1. OSHA requests additional information concerning the controls and work practices presently used to reduce exposures to respirable dust during silo filling, grain dust during the filling of transport vehicles and respirable silica during the harvesting of grapes.

2. OSHA requests any information regarding exposure to pesticidal residue during cotton ginning or other post-harvest agricultural processing.

3. OSHA requests information concerning activities at large agricultural establishments which present exposure to hazardous substances not identified in USHA's preliminary analysis.

4. In addition to those substances identified by OSHA, what other substances found in the Z Table for Agriculture are used in agriculture? During what operations or activities?

5. OSHA is proposing that agricultural workers be protected by all the same exposure limits as workers in other sectors since they face the same risks when exposed. (The use of EPA-registered pesticides pursuant to the label is regulated by EPA.) OSHA intends, through non-mandatory appendices, special publications and/or outreach programs, to inform agricultural employers and employees of the more common substances for which there is exposure in agriculture and appropriate precautions to take. OSHA requests information on the best way to supply this information to the agricultural community and the substances for which this program would be most useful.

6. OSHA has proposed to set Permissible Exposure Limits for over 100 pesticides that are regulated under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). These PELs would only apply if labelling instruction were not followed or if unlabelled pesticides were used. OSHA requests comment on whether additional regulation of registered pesticides is necessary, given the penalties of FIFRA. Would PELs cause confusion in the agricultural sector as to which regulatory requirements would take precedence or would the additional information provided by the exposure limits tend to reduce the number of poisonings from pesticides?

C. History and Need for Revision of PELs in Construction

Construction work sites are complex and varied, and may create special problems for identifying and controlling hazards (Bertinuson and Weinstein, (1978) Occupational Hazards of Construction). Construction sites are temporary and change constantly as the work moves ahead and as new trades arrive on the site. Several trades may share the same work area, exposing each other to toxic substances. The work is usually rushed, increasing the chances that an accident might occur or that a harmful chemical exposure goes unnoticed. Construction workers change jobs often, and some work for a number of employers during the same year. All of these factors contribute to the complex array of activities and related exposures, increasing the potential risk of accident or illness.

According to the Bureau of Labor Statistics, in 1989 the rate of work-related injuries in construction was the highest of any sector at 14.2 per 100 full-time workers. The average rate for all sectors combined was 8.2 injuries per 100 full-time workers. Construction also leads the other sectors in lost workdays, a measure of severity of injuries.

A construction worker is at least four times as likely to die on the job as workers in general. Occupational fatalities occurred at the rate of 5.4 in the private sector in 1989, with the rate for construction being 22.4 per 100,000 full-time workers according to BLS data for 1989.

Rates of occupational illnesses reported to BLS in construction appear to be lower than other sectors. There are a number of reasons for this. One is specifically related to the nature of occupational illnesses, which are more difficult to recognize, often have a long latency between exposure and development of disease, and are more difficult to relate to the workplace than injuries. As a result, injuries and fatalities, which are easy to recognize, have a short latency period, and are often more easily related to the workplace, are much more likely to be reported than illnesses.

Exposure profiles for construction workers vary from jobsite to jobsite, and typically include exposures to multiple substances, some of which they may not be working with directly. Workers tend to be employed on certain jobs or with particular contractors for short periods of time.

The difficulties inherent in identifying occupational illnesses and the transient nature of both the worksite and the workforce are the two major reasons for lack of reporting of occupational illnesses in construction.

The above analysis applies to BLS data. Recognizing this, OSHA has made its best estimate of illnesses and deaths avoided in construction. These are 22,000 illnesses and 15 to 20 deaths avoided per year. See the regulatory analysis for the approach used.

Construction Standards

Standards relevant to construction, primarily safety standards, are found in 29 CFR part 1926. Section 1926.20 of subpart C—General Safety and Health Provisions, under paragraph (a), Contractor requirements states:

(1) Section 107 of the Act requires that it shall be a condition of each contract which is entered into under legislation subject to Reorganization Plan number 14 of 1950 (64 Stata. 1267), as defined in § 1926.12, and is for construction, alteration, and/or repair, including painting and decorating, that no contractor or subcontractor for any part of the contract work shall require any laborer or mechanic employed in the performance of the contract to work in surroundings or under working conditions which are unsanitary, hazardous, or dangerous to his health or safety."

The above regulation was first issued under the Construction Safety Act on April 17, 1971 at 36 FR 7340, and in 1971 became an occupational safety and

health standard for all construction workers. (See pertinent Legal Authority.)

Section 1926.55 regulates exposure to gases, vapors, fumes, dusts, and mists, and references the "Threshold Limit Values of Airborne Contaminants for 1970" of the American Conference of Governmental Industrial Hygienists. These are the limits that currently exist and are enforced in construction. Much scientific knowledge in the area of health effects of toxic substances has been gained in the past twenty years. OSHA is proposing to update these limits. The levels that are being proposed in construction are those levels that are currently in effect in general industry. The objective of this rulemaking is to produce the same exposure limits across all sectors, resulting in the same level of protection for all workers.

In addition, the scope of many of the substance-specific health standards found in 29 CFR part 1910 includes coverage of the construction sector. Lead, 1910.1025, and coke oven emissions are the only substance-specific standards which specify exposure limits that do not cover construction. However, lead is covered in construction to the degree that the 1970 TLV for lead is 200 µg/m³. And while the standard for coke oven emissions does not apply to construction, the coal tar pitch volatile TLV of 200 µg/m³ does apply.

OSHA is proposing, as part of this current rulemaking, a PEL of 50 µg/m³ for lead in construction. This is the level that has existed in general industry since 1976; this is also the level effective in the maritime sector. The ancillary provisions (e.g. medical surveillance, exposure monitoring) are outside the scope of this rulemaking. However, OSHA is currently developing a proposal to address all of the other issues in a comprehensive standard addressing workplace exposure to lead in the construction industry.

As per its legal mandate to do so, OSHA has consulted with the Advisory Committee on Construction Safety and Health (ACCSH) in regard to this proposal. On June 20–1, 1990 ACCSH met and unanimously passed the following motion:

The Advisory Committee on Construction Safety and Health recommends to the Assistant Secretary of Occupational Safety and Health the adoption of the recommendations presented in the report of the workgroup on Permissible Exposure Limits for Construction and proceed with rulemaking to promulgate the D list (Table Z, Construction) as a 1926 construction standard and include in Table D provisions for mineral

wool, fibrous glass, asphalt fume, lead at 50 micrograms per cubic meter and cotton dust at 500 micrograms per cubic meter.

D. History and Need for Establishing PELs in Maritime

The Department of Labor has had some authority for many years for the maritime industry under the Longshore and Harbor Workers Compensation Act (33 U.S.C. 901 et seq.). Specific authority was granted prior to the OSH Act under Public Law 89–742, August 22, 1958, 33 U.S.C. 941 for the Secretary of Labor to issue regulations to protect the health and safety of longshoremen, marine terminal workers, ship repairers, shipbuilders and shipbreakers (See also 33 U.S.C. 902). Pursuant to section 4(b)(2) of the OSH Act, standards issued pursuant to 33 U.S.C. 941 became OSH standards on May 29, 1971 at 36 FR 10466.

At that time the Shipyard standards were in three Parts of 29 CFR part 1915 for ship repairing, part 1916 for shipbuilding and part 1917 for shipbreaking. These were recodified with the same basic organization on October 19, 1977 at 37 FR 22458.

On April 20, 1982 at 47 FR 16984, parts 1915, 1916 and 1917 were consolidated into a new part 1915, Shipyards, covering shipbuilding, ship repairing and shipbreaking. As a consequence of their history, the permissible exposure limits applicable to the new part 1915, Shipyards are complex. The shipbreaking and ship repairing subsectors and the use of toxic solvents and removers in the shipbuilding and ship repair subsectors are covered by the 1970 TLVs of the ACGIH. See §§ 1915.5, 1915.11, 1915.12, 1915.32 and 1915.33. For shipbuilding operations not involving toxic solvents and removers, the 1971 OSHA PELs apply. No specific exposure limits are specified for shipbuilding outside those 2 circumstances. When no standard is specified for a subsector, and there is a standard for general industry, then the general industry standard applies to the subsector. See 29 CFR 1910.5(c). The OSHA general industry standard for air contaminants are the Z Tables in 29 CFR 1910.1000. OSHA did not make the updated (1989) PELs applicable to maritime awaiting the completion of this rulemaking. See 29 CFR 1910.1000(f)(3)(ii). In addition, a number of OSHA single-substance standards (1910.1001-1048) are applicable to the maritime sectors. See the individual standards and 29 CFR 1910.19.

Clearly it is confusing both to the shipyard industry, its employees and for OSHA enforcement for slightly different standards to apply to different

operations in the same work place. (The 1970 TLVs and the 1968 PELs do differ for some substances, though usually not by significant amounts.) Consequently, for shipyards, OSHA feels the existence of different standards for different subsectors should be eliminated as soon as possible. Accordingly, OSHA is proposing that the new PELs will take effect for all of shipyards on the effective date of the standard, to be achieved by any reasonable means of compliance. The preference for engineering controls in the transition period will apply to the 1970 TLVs for all subsectors of shipyards.

Pursuant to the Longshoremen and Harbor Worker Compensation Acts 1958 amendments (33 U.S.C. 941), OSHA in 1960 issued regulations protecting longshore employees (25 FR 1569). These regulations also covered marine terminal employees. They were adopted as OSHA standards on May 29, 1971 at 36 FR 10466. They were recodified as 29 CFR part 1918 on May 19, 1977 at 37 FR 22530.

On July 5, 1983 (48 FR 30886), OSHA issued a final standard specifically covering marine terminals separately from longshoring. The Marine Terminals Standard was designated 29 CFR part 1917. (It should be recalled that the earlier part 1917 covering shipbreaking had been recodified as part of part 1915—Shipyards.) The Marine Terminal Standard basically provides that employees not be exposed to air contaminants over the limit set in the 1971 Z Tables of CFR 1910.1000. See §§ 1917.2(p), 1917.22, 23, 25.

Longshoring operations continue to be regulated by 29 CFR part 1918. OSHA has consistently interpreted that the air contaminant exposure limits set forth in 1910.1000 are applicable pursuant to § 1910.5(c) to longshoring because no quantitative exposure limits are set forth for most air contaminants. Section 1918.93 only sets forth specific numerical limits for carbon monoxide. It is OSHA's intention to clarify in this rulemaking that all the air contaminant exposure limits in the 1971 Z Tables in 1910.1000 are applicable and will remain applicable to longshoring during the transition period.

OSHA is proposing to update the air contaminants standards used in the maritime sector. Ship repairing and shipbreaking are currently covered by the 1970 TLVs, and shipbuilding, marine terminals and longshoring are covered by the 1971 OSHA PELs-subpart Z. The product of this rulemaking will be one table used by all subsectors of Maritime. Thus, this proposed rulemaking will produce consistency across all subsectors of the maritime sector.

This proposal for maritime is necessary for several reasons. First, the existing limits are out-of-date and not sufficiently protective for 376 substances. Second, workers are regularly exposed to a variety of toxic substances in this sector. Third, current standards are inconsistent among the various subsectors of maritime leading to confusion. The Shipyard Advisory Committee has discussed and is supportive of these changes.

E. History and Need for Establishing PELs in Agriculture

Historically, OSHA has developed and applied few health and safety regulations in the agricultural sector. The OSH Act is intended to apply to agricultural workers, though Congress has exempted the employers of farms with ten or fewer employees by appropriations rider since 1977. See the discussion in the Legal Authority section.

When OSHA was formed, the Agency was given two years to adopt "consensus" standards, under section 6(a) of the OSH Act, so that it would have some regulations with which to start enforcement procedures. The issuance of very few standards for "agricultural operations" appears to have been based on the view that, since the 1910 consensus standards of the time were primarily ANSI and NFPA standards, and these standards had been developed by the industrial sector, this raised the question of whether these could be considered "consensus" standards when adopted to fit agricultural situations.

Part 1928 (source: 40 FR 18257, Apr. 25, 1975) of the CFR refers to those standards currently applicable in agriculture. Subpart B, 1928.21 specifically cites those standards in 29 CFR part 1910 (General Industry) which apply to agricultural operations:

- (1) Temporary labor camps—§ 1910.142
- (2) Storage and handling of anhydrous ammonia—§ 1910.111(a) and (b):
- (3) Pulpwood logging—§ 1910.266;(4) Slow-moving vehicles—§ 1910.145;
- (5) Hazard communication—§ 1910.1200

In addition, standards which apply to Roll-Over Protective Structures in agriculture are found in subpart C of 29 CFR part 1928. Part 1928 subpart D addresses the use of guarding for agricultural equipment (Safety for Agricultural Equipment). Field Sanitation, 1928.110, is found in Subpart I—General Environmental Controls. 29 CFR 1928.21(b) specifically states that "(e)xcept to the extent specified in paragraph (a) of this section, the

standards contained in subparts B through T and subpart Z of 1910 of this title do not apply in agricultural operations."

There are no Permissible Exposure Limits (PELs) that apply to agriculture. OSHA states in its Air Contaminants Final Rule, (Federal Register, Vol. 54, No. 12, p. 2383): "In the future OSHA will consider, based on relevance, priorities and administrative resources, whether or not it is appropriate to consider coverage for agriculture." The Agency has considered this issue and concluded that it is appropriate to provide the same level of protection from toxic substances to workers employed in the agricultural sector as workers employed in other sectors, e.g. general industry or construction.

For purposes of analysis of agriculture for this standard, OSHA has relied primarily on the classifications in OMB's Standard Industrial Classification (SIC) manual. The Standard Industrial Classification manual assigns agriculture the following SIC codes: Major Group 01, Agricultural Production-Crops; Major Group 02, Agricultural Production-Livestock; Major Group 07, Agricultural Services. The SIC manual defines agriculture as including an "establishment (e.g. farms, ranches, dairies, greenhouses, nurseries, orchards, hatcheries) primarily engaged in the production of crops, plants, vines or trees (excluding forestry operations); and the keeping, grazing, or feeding of livestock for the sale of livestock * also establishments primarily engaged in the production of mushrooms, bulbs, * * * seeds and in the growing of hydroponic crops." Nurseries and greenhouses are considered to be agricultural establishments only if the products they sell are grown primarily at the establishment. Otherwise these establishments are considered retail trade establishments. Forestry (08), (but not logging) comes under agriculture and is being considered in this rulemaking. Fishing (09) is considered to fall under general industry. However, fishing may wish to submit data, which OSHA will then consider.

OSHA has studied Major Group 07, Agricultural Services, but parts of that sector may be covered by the General Industry standard. Any subsector which believes it is covered but has not been studied, should submit appropriate comments. OSHA's intention is that after after this rule is completed, that all employees under OSHA's jurisdiction will be covered. If any sector believes it has feasibility matters it wishes to bring to OSHA's attention, which OSHA has

not considered, it should submit this information.

Agriculture is one of the most hazardous of U.S. industries, with 1,300 deaths and 120,000 worker injuries in 1989, according to National Safety Council figures. These estimates indicate that agriculture has the second highest death rates of any major industry division, second only to mining, but greater than construction.

In terms of illnesses, the illness incidence rate among agricultural workers for 1989, the latest year reported by the Bureau of Labor Statistics, was 45.5 per 10,000 full-time workers, higher than mining and construction.

In addition, these statistics are believed to underestimate agricultural morbidity by a large margin because OSHA does not require recordkeeping and reporting by farms with 10 or fewer employees and because workers' compensation laws in most states do not cover farms with few employees. As a consequence, the reporting of agricultural injuries and illnesses on a national level is very poor. For illnesses that are the result of agricultural exposures, the statistics are further understated due to the problems inherent in identifying and reporting occupational illnesses.

The single most hazardous group of substances to which agricultural workers are exposed is pesticides. In the United States, any chemical that is to be used for pesticidal purposes must be registered in accordance with EPA, and in particular with Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), requirements. In addition to requiring registration, FIFRA has the authority to regulate conditions of use, including worker safety and health, for pesticidal substances. EPA first regulated pesticide worker safety in 1974, when it promulgated a Worker Safety standard (still being enforced) that applies only to workers performing hand labor at agricultural establishments. EPA has recently proposed to update and expand its worker protection standard for agricultural pesticides. The proposed standard also would apply to pesticide users at farm sites, nurseries, greenhouses, and forest areas used for the commercial production of wood fiber and timber products. EPA has left open the question of the size-class of agricultural establishments to be covered by these regulations and has solicited input on this issue. In contrast to the 1974 rule, the proposed standard would apply to workers engaged in all pesticide handling activities (e.g. mixing, loading, and application) conducted at

agricultural establishments. The FIFRA proposal addresses the following areas: specific information to be provided to workers; training and labeling requirements; selection of personal protective equipment; avoidance of exposure to non-applicators; minimum reentry times; availability of water, soap, and towels; and biological monitoring of cholinesterase levels for pesticide handlers exposed to certain organophosphates for specified durations.

Once FIFRA's Worker Safety standard becomes final, EPA will have exercised its jurisdiction authorized under FIFRA, regulation of many safety and health issues related to worker exposure to use of labelled pesticides. In consequence, OSHA will not, in many cases, have authority to regulate pursuant to section 4(b)(1) of the OSHA Act when a labelled pesticide is used according to its label. See the discussion under Legal Authority.

In 1980, about 600 active ingredients (or groups of active ingredients) were registered under FIFRA (54 FR 7740). Since 1980, EPA has issued 194 registration standards (documents describing EPA's regulatory position and the Agency's underlying rationale for regulating particular pesticides); these 194 standards have addressed approximately 350 chemical substances used either as active or inert pesticide ingredients.

Some of the pesticides currently registered under FIFRA appear on OSHA's Z-Table. For the sake of completeness, and for use as a reference, a short discussion of these substances is included in the appropriate health effects section of the preamble. Where the substance has a FIFRA-registered application, that information is included. In many cases there are non-pesticidal uses of these substances that result in occupational exposures. Again, see the discussion under Legal Authority for OSHA jurisdictional issues.

A number of the substances on OSHA's Z Table, Agriculture are fertilizers. These are among the substances that are covered by this rulemaking. The following are OSHA-regulated substances used as fertilizers in agriculture:

Chemical	CAS No.
Ammonia	7664-41-7
Borax (borates, tetra, decahydrate)	1303-96-4
Calcium cyanamide	156-62-7
Diatomaceous earth (amorphous sili-	
cates)	617490-53-2
Dolomite (calcium carbonate)	1317-65-3
Furfural	98-01-1

Chemical	CAS No.
Gypsum	3397-24-5
Hydrochloric acid (hydrogen chlo-	-
ride)	7647-01-0
Limestone (calcium carbonate)	1317-65-3
Nitric acid	7647-01-0
Perlite	N/A
Phosphoric acid	7684-38-2
Sulfuric acid	7664-93-9

Source: Farm Chemicals Handbook.

Farm workers use many different cleansers and disinfectants that are regulated by OSHA in its Z-1-A Table. Among the most important are: Caustic soda (sodium hydroxide), used to clean milking equipment and containers; and ammonium hydroxide, used to neutralize formaldehyde, another substance commonly used.

Farm workers regularly use solvents. paints, acids, coatings, adhesives and other materials that contain toxic substances. They are thus exposed to heavy metals (e.g., in paints), solvents (when cleaning machinery and tools). fuels (when fueling farm vehicles), resins (in coatings and adhesives), welding fumes (when welding), and toxic gases (from manure pits), and a host of other contaminants. In addition, these workers are routinely exposed to grain dust, a major cause of pulmonary dysfunction in farm workers.

The agricultural work environment is often quite dusty. Agricultural dusts in the farm environment may come from any animal or plant source associated either specifically with agricultural production or in general with the rural environment. Agricultural dusts vary with the season, climate, weather conditions, and type of agricultural operation (Mutel et al., 1986 as cited in: Donham, K., (1986) Hazardous Agents in Agricultural Dusts and Methods of Evaluation, Am J of Ind Med 10:205-220). They are typically complex, including a mixture of both inorganic and organic particles and perhaps aerosolized pesticides and chemical fertilizers (Mutel et al., as cited in: Donham, K., (1966) Hazardous Agents in Agricultural Dusts and Methods of Evaluation, Am J of Ind Med 10:205-220).

Various agricultural activities can result in exposure to dusts. Harvesting, transporting, or storing grain, milling grain, mixing feed or feeding animals, during various activities. Swine and poultry confinement buildings are sources of especially high exposures.

Trucking or otherwise moving grain or hay, cleaning out livestock structures, storing grain, unloading the top of silage from nonairtight silos, and harvesting grain can create exposure to dusts (Darke et al., 1976; Donham et al., 1978. 1983; Lacey and Lacey, 1964; Mutel et al., 1986; as cited in: Donham, K, (1986) Hazardous Agents in Agricultural Dusts and Methods of Evaluation, Am J Ind Med, 10:205-220).

Potential for exposure to animalrelated dusts is encountered during routine animal care, including feeding, cleaning animal quarters, sorting and handling animals, administering medications, milking dairy cows, or replacing their bedding (Donham et al., 1977, as cited in: Donham, K. (1986) Hazardous Agents in Agricultural Dusts and Methods of Evaluation, Am J Ind Med, 10:205-220). An even greater potential for significant exposure to dusts exists when generated in an enclosed structure, such as a barn, silo, or livestock confinement structure.

The Air Contaminants Final Rule (FR Vol 54, No. 12, Jan. 19, 1989) adopted 164 new PELs where none previously existed and 212 PELs that were more protective than the old. There were approximately 160 substances that had been in effect since the publication of the Z-Table and were not considered for change during this rulemaking because there was no difference between the old PEL (Z-1 Table value) and the 1987-88 TLV. (One of the criteria for consideration of updating of a particular PEL was that the 1987-8 ACGIH TLV be significantly different from the old OSHA PEL.)

The situation in agriculture, however, is very different. Because there have been no Z-Tables, and thus no PELs in effect in agriculture, the approximately 180 substances referenced in the earlier paragraph are being proposed for the first time in agriculture. In addition, there are approximately 50 substances which OSHA is not proposing to change for construction and maritime because OSHA determined in the general industry rulemaking that change was not appropriate at that time. These are being proposed for agriculture also. There is the same need for health protection from the toxic effects of these chemicals in agricultural applications as in other sectors. Health write-ups are provided.

In addition, there are ten substances for which OSHA has developed

comprehensive substance-specific standards. These standards are not limited to a Permissible Exposure Limit, but typically have other provisions (e.g. medical surveillance, exposure monitoring requirements, medical removal protection) which further reduce the risk of illness to workers exposed to these substances. None of the substance-specific standards has been applied to the agricultural sector. OSHA is attempting to correct this situation during this rulemaking. However, since this rulemaking is covering only the Permissible Exposure Limits and not other provisions, only the PELs for these substances will be proposed. The same PELs that have been previously established in other sectors are being proposed in agriculture for the following substances: Asbestos. vinyl chloride, inorganic arsenic, lead. benzene, cotton dust, 1,2'-dibromo-3chloropropane (DBCP), acrylonitrile, ethylene oxide and formaldehyde.

It is important to note that farming operations that do not maintain a temporary labor camp and that employ 10 or fewer employees are exempt from OSHA regulations. In addition, immediate family members of farm employers are not regarded as employees when making the determination as to number. These situations are exempted by appropriations rider. See the discussion

under Legal Authority.

Small farms constitute the majority (96%, see Preliminary Regulatory Impact Analysis) of American farms. Addressing the injuries, illnesses and fatalities which have become part of daily life on these farms is an area OSHA feels it does have a responsibility, albeit not a regulatory one. The focus of OSHA's current effort is to work with and through the U.S. Department of Agriculture to reach out to states, land grant universities, Farm Bureaus, Granges, 4-H Clubs, and others such as the National Safety Council and National Farmers Union in furthering education and awareness in agricultural health and safety. OSHA is also collaborating closely with NIOSH to facilitate information collection and dissemination to the benefit of both agencies and ultimately the agricultural community. Although a fair amount of groundwork has already been laid, OSHA is still in the early stages of its agricultural outreach initiative.

TABLE I.F.—SUBSTANCES INCLUDED IN THE UPDATE OF PELS FOR CONSTRUCTION, MARITIME, AND AGRICULTURE

H. Mixture Formula

The current OSHA PELs for general industry, construction, and maritime are covered by a mixture or computation formula. It is located at 29 CFR 1910.1000(d) for general industry. In construction it is incorporated by cross reference to the 1970 ACGIH TLVs. Maritime includes the mixture formula by cross reference either to § 1910.1000 or to the 1970 ACGIH TLVs.

The purpose of the mixture formula is to protect the health of workers exposed to two or more toxic substances. If a worker is exposed to two or more toxic substances which affect the same organ or cause the same disease or material health impairment, being exposed at the maximum permissible exposure limit for each substance will often not protect the worker from material health impairment.

Consequently, in these circumstances the mixture formula keeps exposure below the maximum for each of the several substances the workers are exposed to. For example, if a worker is exposed to 50% of the PEL for a substance that causes cardiovascular disease, then that worker can be exposed to no more than 50% of the PEL of a second substance which causes cardiovascular disease. The mixture formula is only applied by OSHA when the substances affect the same organ, or cause the same disease or material health impairment.

OSHA has requested that the White House's Federal Coordination Council for Science, Engineering and Technology (FCCSET) give advice on the use of the mixture formula. The Council will hold a conference in December on the issue. Both EPA and FDA are interested in this issue and will participate. Depending on the Council's advice, OSHA may open the mixture formula for reconsideration in the first update of the PELs for all industry sectors. It would be premature to consider this issue before receiving the Council's advice and inefficient to consider it for one industry sector at a time since the biology, of course, is the same for all workers.

OSHA is proposing to include the mixture formula for agriculture because of the health reasons stated above, its long acceptance in occupational health practice, and for consistency among the sectors. OSHA is not opening the issue of the mixture formula for construction and maritime since it already applies and would be premature prior to the Council's recommendations.

II. Pertinent Legal Authority

The publication of this standard is authorized by sections 6 and 8 of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. 655 and 657. Section 6(b)(5) governs the issuance of occupational safety and health standards dealing with toxic materials or harmful physical agents.

It states:

The Secretary in promulgating standards dealing with toxic materials or harmful physical agents under this subsection shall set the standard which most adequately assures, to the extent feasible, on the basis of the best available evidence, that no employee

will suffer material impairment of health or functional capacity even if such employee has regular exposure to the hazard dealt with by such standard for the period of his working life. Development of standards under this subsection shall be based upon research, demonstrations, experiments, and such other information as may be appropriate. In addition to the attainment of the highest degree of health and safety protection for the employee, other considerations shall be the latest available scientific data in the field, the feasibility of standards, and experience gained under this and other health and safety laws. Whenever practicable, the standard promulgated shall be expressed in terms of objective criteria and of the performance

Section 3(8) defines an occupational safety and health standard as "a standard which requires conditions, or the adoption or use of one or more practice, means, methods, operations, or processes, reasonably necessary or appropriate to provide safe or healthful employment and places of employment."

The Supreme Court has held under the Act that the Secretary, before issuing any new standard, must determine that it is reasonably necessary and appropriate to remedy a significant risk of material health impairment. Industrial Union Department v. American Petroleum Institute, (IUD v. API). 488 U.S. 607 (1980). The Court stated that "before he can promulgate any permanent health or safety standard, the Secretary is required to make a threshold finding that a place of employment is unsafe in the sense that significant risks are present and can be eliminated or lessened by a change in practices" (448 U.S. at 642). The Court also stated "that the Act does limit the Secretary's power to require the elimination of significant risk" (488 U.S. 644, n. 49).

The Court indicated, however that the significant risk determination is "not a mathematical straitjacket," and that "OSHA is not required to support its finding that a significant risk exists with anything approaching scientific certainty." The Court ruled that "a reviewing court [is] to give OSHA some leeway where its findings must be made on the frontiers of scientific knowledge [and that] * * * the Agency is free to use conservative assumptions in interpreting the data with respect to carcinogens, risking error on the side of over protection rather than under protection" (448 U.S. at 655, 655).

The Court also stated that "while the Agency must support its finding that a certain level of risk exists with substantial evidence, we recognize that its determination that a particular level of risk is 'significant' will be based

largely on policy consideration." (488 U.S. at 655, n. 62).

After OSHA determines that a significant risk exists and that such risk can be reduced or eliminated by the proposed standard, it must set a standard which is technologically and economically feasible. In American Textile Manufacturers Institute v. Donovan, 542 U.S. 490, 531, n. 32 (1981) the Supreme Court held that "costbenefit analysis is not required by statue because feasibility analysis is." The aim is to set the lowest feasible level necessary to eliminate significant risk.

Congress intended the OSH Act to be very broad in coverage. Section (2)(b) of the act states:

"The Congress declares it to be its purpose and policy * * * to assure so far as possible every working man and woman in the nation safe and healthful working conditions * * *"

Clearly this indicates that OSHA should cover working men and women in all sections of the economy—general industry, construction, maritime and agriculture, and indeed OSHA has set standards for all those sectors.

When OSHA proposed and issued its updated exposure limits for general industry it stated that it would expand the new limits to cover the construction, maritime and agriculture sectors. See 53 FR 20979; June 7, 1988 and 54 FR 2383; January 19, 1989. The reason that OSHA did not propose to immediately cover those sectors was the time it would take to consult with those sectors and to perform feasibility analyses for these sectors.

Shortly after the completion of the updated PEL's for general industry OSHA commenced those activities. It consulted with the Construction Advisory Committee (CACOSH) and the Shipyard Advisory Committee. It held a series of meetings with the agricultural community. Also feasibility analyses were commenced for these sectors. These activities are discussed above and in the feasibility section of the preamble and the consultations and information have been taken into account in this proposal.

Construction

Federal regulation of construction activities was covered prior to OSHA by the Construction Safety Act (Pub. L. 91–54, August 23, 1969, 33 U.S.C. 941). That Act gives the Secretary of Labor authority to issue and enforce regulation to protect the health and safety of employees who worked for contractors performing construction work for the U.S. government. It also provided for the creation of an advisory committee on such regulations.

The Department of Labor issued regulations under the Construction Safety Act on April 17, 1971 at 36 FR 7340. Those regulations included at 29 CFR 1518.55 requirements that the workers of construction contractors for the U.S. government not be exposed over the Threshold Limit Values for 1970 of the ACGIH. That requirement became an occupational safety and health standard for all construction workers under the OSH Act pursuant to Section 4(b)(2) on April 28, 1971. It was later recodified at 29 CFR 1926.55 on June 24, 1974 at 39 FR 22801. The large majority of exposure limits applicable to construction employers are the 1970 TLV's.

Many of the single substance standards which OSHA has issued have been made applicable to the construction industry. See 29 CFR 1910.19 and the individual standards.

OSHA's procedural rules for issuing standards under the OSH Act state that OSHA shall consult with the Construction Advisory Committee. See 29 CFR 1911.10. OSHA has done so in this case and the Committee has advised OSHA to proceed. See the discussion above under History and need for the Standard in Construction.

Maritime

The Department of Labor has had some authority for many years for the maritime industry under the Longshore and Harbor Workers Compensation Act (33 U.S.C. 901 et seq.). Specific authority was granted prior to the OSH Act under Public Law 89-742, August 22, 1958, 33 U.S.C. 941 for the Secretary of Labor to issue regulations to protect the health and safety of longshoremen, marine terminal workers, ship repairers, shipbuilders and ship breakers (See also 33 U.S.C. 902). Pursuant to section 4(b)(2) of the OSH Act, standards issued pursuant to 33 U.S.C. 941 became OSH standards on May 29, 1971 at 36 FR

At that time the Shipyard standards were in three parts of 29 CFR, part 1915 for ship repairing, part 1916 for shipbuilding and part 1917 for shipbreaking. These were recodified with the same basic organization on October 19, 1977 at 37 FR 22458.

On April 20, 1982 at 47 FR 16984, parts 1915, 1916 and 1917 were consolidated into a new part 1915, Shipyards, covering shipbuilding, ship repairing and shipbreaking. As a consequence of their history, the permissible exposure limits applicable to the new part 1915, Shipyards are complex. The shipbreaking and ship repairing subsectors and the use of toxic solvents

and removers in the shipbuilding and ship repair subsectors are covered by the 1970 TLV's of the ACGIH. See §§ 1915.5, 1915.11, 1915.12, 1915.32 and 1915.33. For shipbuilding operations not involving toxic solvents and removers. the 1971 OSHA PEL's apply. No specific exposure limits are specified for shipbuilding outside those 2 circumstances. When no standard is specified for a subsector, and there is a standard for general industry, then the general industry standard applies to the subsector-See 29 CFR 1910.5(c). The OSHA general industry standards for air contaminants are the Z Tables in 29 CFR 1910.1000. OSHA did not make the updated (1989) PELs applicable to maritime awaiting the completion of this rulemaking. See 29 CFR 1910.1000(f)(3)(ii). In addition a number of OSHA single substance standards (§§ 1910.1001-1048) are applicable to the maritime sectors. See the individual standards and 29 CFR 1910.19.

Clearly it is confusing both to the shipyard industry, its employees and for OSHA enforcement for slightly different standards to apply to different operations in the same work place. The 1970 TLV's and the 1968 PEL's do differ for some substances though usually not by significant amounts. Consequently for shipyards, OSHA feels the existence of different standards for different subsectors should be eliminated as soon as possible. Accordingly OSHA is proposing that the new PELs take effect for all of shipyards, as soon as the effective date of the standard, to be achieved by any reasonable means of compliance. The preference for engineering controls in the transition period will apply to the 1970 TLV's for all subsectors of shipyards.

Pursuant to the Longshoremen and Harbor Worker Compensation Acts 1958 amendments (33 U.S.C. 941), OSHA in 1960 issued regulations protecting longshore employees (25 FR 1569). These regulations also covered marine terminals employees. They were adopted as OSHA standards on May 29, 1971 at 36 FR 10466. They were recodified as 29 CFR part 1918 on May 19, 1977 at 37 FR 22530.

On July 5, 1983 (48 FR 30886), OSHA issued a final standard specifically covering marine terminals separately from longshoring. The Marine Terminals Standard was designated 29 CFR part 1917. (It should be recalled that the earlier part 1917 covering shipbreaking had been recodified as part of part 1915—Shipyards.) The Marine Terminal Standard basically provides that employees not be exposed to air contaminants over the limit set in the

1971 Z tables of CFR 1910.1000. See §§ 1917.2(p), 1917.22, 23, 25.

Longshoring operations continue to be regulated by 29 CFR part 1918. OSHA has consistently interpreted that the air contaminant exposure limits set forth in 1910.1000 are applicable pursuant to § 1910.5(c) to longshoring because no quantitative exposure limits are set forth for most air contaminants. Section 1918.93 only sets forth specific numerical limits for carbon monoxide. It is OSHA's intention to clarify in this rulemaking that all the air contaminant exposure limits in the 1971 Z Tables in § 1910.1000 are applicable and will remain applicable to longshoring during the transition period. Any comments to the contrary should be submitted in this rulemaking.

Agriculture

OSHA issued its first standards for agriculture May 29, 1971 (36 FR 10466, 10699) pursuant to section 6(a) of the OSH Act. The specific requirements were specified in 29 CFR 1910.267.

That section stated:

- § 1910.267 Agricultural operations (a)(1) The standards referenced in the remaining subparagraphs of this paragraph apply to the indicated operations, whether or not they include as a part of, agricultural operations.
 - (2) Sanitation in temporary labor camps— § 1910.142.
 - (3) Storage and handling of anhydrous ammonia—§ 1910.111 (a) and (b).
 (4) Pulpwood logging—§ 1910.226.
 - (5) Slow-moving vehicles—§ 1910.145.
 - (b) Except to the extent specified in paragraph (a) of this section, the standards contained in subparts B through S of this part do not apply to agricultural operations.

(c) The development of standards having more general application to agricultural operations will be the subject of study under section 6 of the Act.

OSHA issued a standard to protect farm workers from pesticides by specifying field reentry times, protective equipment and sanitation codified at § 1910.267a (1974). That standard was vacated by the Court of Appeals on the basis that pursuant to section 4(b)(1) of the OSH Act, OSHA was preempted from regulating pesticides regulated by EPA under FIFRA where EPA exercised statutory authority to prescribe or enforce standards or regulations enforcing occupational safety or health.

In 1975 OSHA recodified the agriculture standard as a new 29 CFR part 1928. (40 FR 18254, April 25, 1979). OSHA issued various standards applicable to the agriculture sector but because of § 1910.267(b) as amended, the exposure limits in what came to be § 1910.1000 Tables Z-1, Z-2 and Z-3

never became applicable to agriculture. When OSHA issued substance specific standards it also did not make them applicable to agriculture. Consequently none of OSHA's exposure limits are currently applicable to agriculture.

On September 30, 1976 (Pub. L. 94-439, 90 Stat. 1418) Congress included a rider on the Department of Labor appropriations act for fiscal 1977 stating that OSHA should not expend any funds to issue or enforce any standard applicable to any person engaged in a farming operation employing 10 or fewer employees.

That rider has been reenacted each year subsequently. The rider for fiscal 1991 (Pub. L. 101–517, 104 Stat. 2194) states

That none of the funds appropriated under this paragraph shall be obligated or expended to prescribe, issue, administer, or enforce any standard, rule, regulation, or order under the Occupational Safety and Health Act of 1970 which is applicable to any person who is engaged in a farming operation which does not maintain a temporary labor camp and employs ten or fewer employees:

Accordingly OSHA is only proposing to apply the Air Contaminants standard to farming operations which maintain a temporary labor camp or which employ more than 10 employees. For this exemption to apply there can not be more than 10 employees on any day in the year. In addition, employees who technically work for a labor only subcontractor but work under the direction of the farm operation are considered employees of the farm for purposes of determining whether it has more than 10 employees. In practice this rider means that only quite large farms will be covered by this regulation. See the discussion under the History and Need Section.

As discussed above pursuant to section 4(b)(1) of the OSH Act and the above cited cases, use of an EPA labelled pesticide on a farm as a pesticide pursuant to the label where that label includes employee protection provisions is not covered by the proposed air contaminant standard. Approximately 100 of the chemicals that OSHA is proposing in 29 CFR 1928.1000 Table Z may fit that category.

These EPA-labeled pesticides are still listed in Table Z and the exposure limit will be applicable in circumstances when those substances are not used as pesticides pursuant to the FIFRA label. Examples of these situations include when the pesticide is used for a non pesticide use or for a pesticide use not authorized by the EPA label. It should be noted that a number of common chemicals with non pesticide uses are

also labelled pesticides. In addition a farmer may make and use a pesticide which he could have purchased already labelled. In these circumstances there is no requirement for EPA labelling, and OSHA would have jurisdiction. The agricultural employee would then be covered by the OSHA PEL. OSHA has come across situations like this and believes that it is important not to allow loopholes to develop. In addition OSHA believes that publishing exposure limits for pesticides even when not enforceable provides useful information. Employer and employees may find the information useful to assist in protecting themselves from the pesticide's toxic effects.

In addition it should be noted OSHA is applicable only to employment relationships. If the farmer is a sole proprietor the farmer and generally the farmer's immediate family are not covered.

OSHA has concluded that updating the Air Contaminant levels for construction, maritime and agriculture workers to reflect recent information is among the highest priorities for the Agency. This will reduce exposure limits for approximately 212 substances currently regulated and add exposure limits for approximately 164 substances which are currently unregulated for the construction and maritime sectors. These new limits and 220 others which currently protect other employees will protect agriculture employees. The health literature indicates this must be accomplished to improve worker health; it is one of Congress's current goals and will greatly increase occupational health protection for a very large number of workers.

In order to accomplish this high priority task in a reasonable time in the light of limited administrative resources, it is necessary to narrow somewhat the issues to be faced by the Agency in this proceeding and to build on previous efforts of the agency. Consequently, it is necessary to delay other worthwhile goals and concurrent Congressional purposes.

This approach is consistent with the general principles of administrative law. An Agency may set priorities within the framework of its statutory authority. Secondly, an Agency may take substantial steps towards its statutory goals, without having to achieve them completely, when Agency resources are not sufficient to complete all aspects initially.

Congress recognized that the Secretary could not address all occupational safety and health problems simultaneously. It therefore gave the Secretary discretion to set priorities in exercising the Secretary's rulemaking authority. As section 6(g) of the Act, 29 U.S.C. 655(g), states:

In determining the priority for establishing standards under this section, the Secretary shall give due regard to the urgency of the need for mandatory safety and health standards for particular industries, trades, crafts, occupations, businesses, workplaces or work environments.

In proposing this addition to the Act, Senator Javits explained that its purpose was "to relieve the Secretary of the necessity for waiting to promulgate whatever standards he wishes to promulgate across the board but rather, allowing him to yield to more urgent demands before he tries to meet others." Leg. Hist 505. Thus, the Act has "built in flexibilities" that the Secretary may use, such as establishing "the priorities between the various occupations that may require standards." Rational Congress of Hispanic American Citizens v. Usery, 554 F. 2d 1196, 1199 (D.C. Cir. 1977); see also National Congress v. Marshall, 656 F. 2d 882 (D.C. Cir. 1979). The flexibility expressed in the statute and legislative history is consistent with the well-established principle that an administrator may adopt a "rational, one step at a time' approach to rulemaking." National Roofing Contractors Ass'n v. Brennan, 495 F. 2d 1294, 1299 (7th Cir.), cert denied, 419 U.S. 1105 (1974) (OSHA roofing standard); cf., Industrial Union Dept. v. American Petroleum Institute, 488 U.S. 607, 663, (1980) (Burger, concurring) (OSHA can act in its legislative capacity "to focus on only one aspect of a larger problem"); United Steelworkers v. Auchter, 763 F. 2d 728, 738 (3rd Cir. 1985) (Although OSHA's decision to exclude workers in some industries from a standard requires explanation, "[s]ection 6(g) clearly permits the Secretary set priorities for the use of the agency's resources and to promulgate standards sequentially."); IUD v. Hodgson, 499 F. 2d 467, 480 n. 31 (D.C. Cir 1974) ("The [OSHA] statutory scheme is generally calculated to give the Secretary broad responsibility for determining when standards are required and what those standards should be.").

OSHA has concluded that setting exposure limits for the large number of substances involved in this rulemaking for construction, maritime and agriculture employees has priority over exploring the need for accompanying medical surveillance, exposure monitoring and industrial hygiene provisions for a much smaller number of substances at this stage. Section 6(b)(7) of the Act, of course, indicates that "where appropriate" such provisions are

to be included. Although regulating these provisions is a concurrent goal of Congress, so was lowering exposure for the many unregulated or inadequately regulated substances where scientific data indicate lower exposures are needed. However, OSHA has inadequate resources to accomplish both goals at this time. Lowering exposures is a higher priority because it is more effective in reducing diseases and material impairments of health.

OSHA has already addressed some of section 6(b)(7)'s goals, as they relate to labels and warnings, in the generic Hazard Communication Standard, 29 CFR 1910.1200. It is working on a standard to improve respirator use for all chemicals (47 FR 20803). It is considering generic regulation for exposure monitoring (53 FR 32591–32595) and medical surveillance (53 FR 32595–32598). OSHA does not have the resources to conclude this rulemaking in any reasonable time, and also consider these issues.

OSHA does have legal authority not to address ancillary provisions in this rulemaking and determinations about the appropriateness of ancillary provisions have not been made. That is a rational use of its priority setting authority in the light of OSHA's limited resources. The language of section 6(b)(7) is not an absolute requirement to include such provisions and this is an "appropriate" circumstance not to include them. The actions already initiated by OSHA indicate it is facing the issue of ancillary provisions in a responsible and reasonable manner.

OSHA, in the air contaminants rulemaking process, has rationally and efficiently used the priority process to maximize employee protection while meeting all legal requirements. OSHA proceeded first with general industry so as not to hold up the general industry rulemaking while it was consulting with the construction, maritime and agriculture sectors and so it would have the resources to carefully study feasibility in the construction, maritime and agriculture sectors.

In the general industry rulemaking OSHA carefully considered what would be the appropriate universe of substances to consider for change. (See 53 FR 20966–87, 20977–79). Then OSHA proposed changing or requested comments on the appropriateness of changing the exposure limits for 428 substances. After reviewing comments and analysis of the studies, OSHA concluded that changes were appropriate for 376 substances.

OSHA believes that reconsidering the universe of substances to be considered

in this rulemaking would substantially delay issuing more protective limits for many substances for maritime, agriculture and construction workers. Similarly, proposing new limits for substances for which OSHA concluded new limits were not necessary or would involve excessively lengthy analysis in the general industry rulemaking, would also result in substantial delay in issuing more protective limits for many substances in construction, maritime and agriculture. In addition it would be a waste of OSHA's resources to reconsider decisions it just recently made based on substantial evidence and public comment on these matters. Resources used for such reconsideration could not be utilized on other necessary improvements in worker health and safety.

Accordingly, based on its priority setting authority, OSHA is proposing to change in this rulemaking only the 376 substances for which it determined change was appropriate for general industry and is opening the record for maritime and construction only for those 376 substances. In addition to proposing these 376 substances for agriculture. OSHA is proposing to adopt for agriculture the PEL's for the approximately 220 substances which currently cover construction and maritime and which OSHA is not reopening for consideration in construction and maritime. These include the approximately 160 Z-table substances OSHA did not consider in the general industry rulemaking, approximately 10 single standard substances and the approximately 50 substances, OSHA considered, but decided not to change for general industry.

Lead is being covered in this rulemaking. The general industry lead standard of 50 ug/m3 plus ancillary provisions in 29 CFR 1910.1029 is applicable to the maritime industry but does not apply to construction. Currently all that is applicable is a 200 ug/m³ exposure limit. Several recent studies have indicated that cases of lead poisoning are occurring in construction workers. The Construction Advisory Committee recommended that OSHA lower the exposure limit for construction workers as soon as possible. OSHA agrees with the recommendation and is accordingly proposing the 50 ug/m3 limit for construction (and agriculture) through the PEL's rulemaking as the most efficient way of setting a more protective exposure limit for lead in these sectors.

OSHA has also commenced consideration of ancillary provisions for

lead exposure in construction. However, this process will take longer because of issues like medical removal protection, which require extensive consideration because of the different characteristics of the construction industry.

In the general industry rulemaking for air contaminants OSHA extensively considered the health effects of the substances regulated. The initial analysis was published in the proposal, extensive public comments were received, and OSHA analyzed more than 2000 studies and 1500 comments in reaching its final decisions as discussed in the final preamble. Those final conclusions are based on the science current through 1987. In consequence OSHA has a high degree of confidence in the underlying scientific merit of its final exposure limits. (In a very few cases OSHA did indicate that more extensive analysis would be appropriate.)

The proposed exposure limits for agriculture, construction and maritime are based on the final levels and analysis for general industry. That information is both current and has been based on a recent notice and comment rulemaking. OSHA has incorporated into the analysis the "latest available scientific data in the field" (section 6(b)(5)). OSHA has made an extensive search of the 1987 and later scientific literature which may not have been available in the general industry rulemaking and has incorporated the most recent studies into the health analyses for each substance.

OSHA will issue final standards meeting legal requirements and good science. If the new studies or new comments demonstrate that the proposed limits are not legally or scientifically supportable OSHA will make appropriate changes.

However OSHA's intent is not to make adjustments in the proposed level in this rulemaking because on balance the new studies or comments may suggest but do not compel some minor adjustment in the limit. OSHA's belief is that employees in all of the sectors it regulates should be equally well protected based on the health science information. (There may be some differences based on feasibility) Obviously people are biologically the same no matter what industry they may be employed. In addition a certain unfairness is created if employees in one sector are better protected than employees in another sector (absent compelling feasibility reasons).

If OSHA made minor changes in the proposed exposure limit based on a slight tilting of the weight of the evidence, the result would be that workers in general industry would be covered by a different level than workers in construction, agriculture and maritime. Consequently consistency in approach and protection would be lost. In addition it would seriously waste OSHA's scientific resources to fine tune levels for construction, agriculture and maritime in this rulemaking, and then have to reconsider that same fine tuning for general industry in a subsequent rulemaking.

OSHA believes that adjustments to the new air contaminants levels are best done in the first PEL update, rather than in this rulemaking. OSHA intends to regularly update the Z Table levels based on new scientific data and to add new substances to the Z-Tables. In each such update OSHA intends that the additions and changes will apply to all sectors; general industry, construction, maritime and agriculture. OSHA has publicly announced its intention to carry out these periodic updates. See the Regulatory Agenda at 56 FR 17566 (April 22, 1991). This approach is biologically sound, fairer to workers and is a more efficient use of OSHA's scientific resources. Consequently OSHA believes that this two prong approach, using this rulemaking to expand the new PEL's to construction, maritime and agriculture, and the first update to be the principle rulemaking to change any of the new PEL's across the board, is a sensible and permissible use of OSHA priority setting

OSHA wishes to make it absolutely clear, that it is not reopening exposure limits for general industry in this rulemaking. It will not consider, and will not consider as a part of the rulemaking record, comments or information intended to change the exposure limits for general industry. Any such comments will be considered requests under section 6(b)(1), that OSHA consider such substance for review in the first PEL update rulemaking. That rulemaking is likely to commence in

There are 3 substances only, which OSHA will be considering for general industry, as well as construction, maritime and agriculture. These are asphalt fumes, mineral wool and fiberglass (which includes refractory ceramic fibers or RCF's). OSHA stated in the general industry final rule that it needed to further study these substances before reaching final conditions. (See 54 FR 2510, 2515, 2679). In this rulemaking, OSHA is reopening the rulemaking record for comment on all issues (health and feasibility) relating to these substances for general industry

and construction, maritime and agriculture.

OSHA through this rulemaking is proposing that the exposure limits for all substances it regulates (basically) will apply to all workers in all sector within OSHA jurisdiction. Consequently exposure limits for some substances will apply to sectors where OSHA is not aware of exposure. OSHA is following this approach because it believes that it represents sound policy and meets OSHA legal requirements.

OSHA has at various times carved out exemptions from its standards based on the belief that there were no exposures or only very low exposures. However in OSHA's experience it often turns out that there are indeed exposures which OSHA is not aware of at the time, or indeed the exemption becomes a loophole where an employer attempts to organize its business operations so as to come within the exempt sector though there are significant exposures.

For example the coke oven standard did not apply to the construction sector. So some employer's designated work on coke ovens, construction work, and hired construction contractors to perform it. It was then argued that though these workers had significant exposures, they were not covered because it was "construction work" they were doing. OSHA also exempted gas station attendants from the benzene standard because studies showed exposures were very low in relation to the PEL because of the low levels of benzene in gasoline. Subsequently oil companies greatly increased the level of benzene in gasoline and employee exposures are now much closer to the PEL. It also was argued that the wording of the exemption covered mechanics, though the exposure patterns are different and could be higher. A wood preserver argued to EPA that since it made the arsenical preservative it used. it was not covered by EPA labeling requirements, and to OSHA that since the chemical it used was an EPA regulated preservative, it was not covered by OSHA regulations. (As stated above, OSHA believes this argument without merit).

OSHA believes that making it easier to create loopholes will tend to reduce worker protection. Secondly the few workers who might be exposed in sectors where OSHA is not aware of exposure are entitled to protection. They are at just as much health risk per unit of exposure as are workers in other sectors.

In addition this policy does not create any unnecessary economic burdens. If there are no workers exposed, there will be no costs. If there are few workers exposed the costs will be low.

In addition the time taken to analyze in depth whether or not there are exposures in a sector where there may be just a few, are a waste of regulatory resources. That information adds nothing to worker protection or for that matter to economic efficiency.

This approach meets OSHA legal requirements. A worker in a sector where there are few workers exposed (some of which OSHA may not know about) is at significant risk of material impairment of health, if over the exposure limit to the same degree as the worker in a sector where many workers are exposed. The cost is going to be insignificant in relation to industry resources and none, if indeed there is no exposure.

As previously noted OSHA is required under its statutory authority to "set the standard which most adequately assures, to the extent feasible, on the basis of the best available evidence, that no employee will suffer material impairment of health or functional capacity even if such employee has regular exposure to the hazard dealt with by such standard for the period of his working life" under the provisions of section 6(b)(5) of the OSH Act.
"Material impairment" is therefore a term which needs to be considered when issuing standards.

In this rulemaking, OSHA is considering establishing new or revised PELs for approximately 370 separate substances for construction and maritime and 600 for agriculture. The health effects for these substances cover a wide spectrum of severity including: life threatening effects; disabling effects; various diseases; irritation to different organs or tissues; and changes in organ functions indicative of future health decrements.

The statutory requirements in sections 3(8) and 6(b)(5) are quoted above. Other statutory criteria are set forth in section (2)(b) which states:

The Congress declares it to be its purposes and policy, through the exercise of its powers to regulate commerce among the several States and with foreign nations and to provide for the general welfare, to assure so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our human resources.

One of the earlier Senate drafts of the OSHA bill did not include the word "material" before the word "impairment." That word was added by an amendment of Senator Dominick. The Senator stated with respect to that amendment:

What we were trying to do in the billunfortunately, we did not have the proper wording or the proper drafting-was to say that when we are dealing with toxic agents or physical agents, we ought to take such steps as are feasible and practical to provide an atmosphere within which a person's health or safety would not be affected. Unfortunately, we had language providing that anyone would be assured that no one would have a hazard, or at least, we would require the Secretary to set standards so stating, and that in the HEW standard there would be a requirement to proceed on that basis so that no one would have any problem for the rest of his working life. It was an unrealistic standard. As modified, we would be approaching the problem by looking at the problem and setting a standard or criterion which would not result in harm (Legislative History p. 502).

The D.C. Circuit Court considered the concept of material impairment and reviewed the Legislative History in the Lead Case.

It stated:

The essential question under section 6(b)(5) for this case is whether OSHA acted within the limits of this mandate to establish "material" impairment of health when it set a standard designed to protect workers from the subclinical effects of lead. As a statutory matter, after examining precedent and legislative history, we hold that section 6(b)(5) empowers OSHA to set a PEL that prevents the subclinical effects of lead that lie on a continuum shared with covert lead disease. (United Steelworkers v. Marshall. 647 F. 2d at 1246–49. See also the more extended discussion there).

The legislative history and judicial analysis indicate that OSHA is to take a balanced but protective approach. Some impairments are so slight a discomfort that they are not material and do not provide a basis for regulation. A complaint of minor discomfort, in and of itself, is not material impairment. However, the OSH Act is designed to be protective of workers and is to protect against impairment with less impact than severe impairment.

These health effects are related to two different types of exposure: acute and chronic. Because of the difference between the health effects associated with these two types of exposure, OSHA must consider different types of PELs (TWA, STEL, or ceiling) to protect against material impairment.

OSHA asked for comment on the subject of "material impairment" in the general industry rulemaking, especially with regard to whether sensory irritation should be considered to be material impairment. There was a relatively limited amount of comment. The most complete response was provided by NIOSH (Ex. 8–47) which stated:

The recognition of sensory irritation as potentially being "material impairment of health" is consistent with the current scientific consensus related to health effects of environmental agents.

Mucous membrane irritants can cause increased blink frequency and tearing; nasal discharge, congestion, and discomfort, wheezing, chest tightness, and dyspnea. Work environments often require levels of physical and mental performance considerably greater than encountered in daily living. Even in the absence of any permanent impairment, the symptoms listed can interfere with job performance and safety.

Mucous membrane irritation can result in inflammation, which may lead to increase susceptibility to nonspecific irritants and infectious agents. For example, experimental ozone exposure in humans results in increased airway reactivity. Also, studies of exposure to environmental tobacco smoke have shown irritative symptoms and evidence of increased frequency of respiratory tract illnesses in young children and decreased pulmonary function in adults

Mucous membrane irritation is associated with respiratory illnesses, depending on the composition of specific exposure and on the dose, duration, and frequency of exposure. No universally applicable conclusion can be drawn at this time regarding the association between irritative symptoms and permanent injury or dysfunction. Where certain individuals show no measurable impairment after an exposure, even when experiencing irritative symptoms, others may develop identifiable dysfunction.

Aside from the effects of irritations, mucous membrane exposure may result in absorption of a substance, with resultant systemic toxicity. An inflamed mucous membrane may be an even more effective route of absorption, either for the irritant or for other substances. Furthermore, injury to bronchopulmonary membranes can impair removal of particulates from the respiratory

Thus, according to NIOSH, sensory irritants interfere with job performance and safety, cause inflammation, may increase the victim's susceptibility to other irritants and infectious agents, lead to permanent injury or dysfunction. or permit greater absorption of hazardous substances. In sum, NIOSH and most other respondents, in the general industry rulemaking agreed that sensory irritation caused by occupational exposure to the irritant substances included in this proposal constitutes a material impairment of health.

Of course, irritation also covers a spectrum of effects, some serious and some trivial. Hence, a complaint of minor irritation would not in and of itself constitute material impairment. In addition, OSHA would weight irritation with physical manifestations more heavily than irritation with purely

subjective responses. This does not mean that purely subjective responses would not constitute material impairment. That judgment would depend on the magnitude of the irritation.

OSHA also believes that clinical, tissue or organ changes, or properly documented pain, chest tightness, migraine headache or similar reactions reflected in responses by persons, may also represent material impairment of health. Each of these are considered on a case-by-case basis in this Rulemaking. OSHA believes that its approach is consistent with the Act and Congressional intent regarding material impairment of health.

All of the revised or new PELs in this proposal represent in OSHA's views situations involving material impairment of health.

OSHA's analyses regarding material impairment of health, as applied in this proposal, are provided in three separate ways. First, they are included in the introductory discussion for health effects. Second, the discussion of each of the substances contains health effect information for all new or revised PELs. Third, this discussion provides examples, and general guidance regarding the OSHA decision process, and accounts for the severity spectrum of health effects, and the separate cases involving chronic and acute exposures.

As previously indicated, health effects cover a wide range of severity levels. A precise delineation between material impairment and non-material impairment is not possible since a variety of factors must be considered, such as the composite health effect and frequency and duration of the effect, to determine if a substance represents, a material impairment of health. However, a small reduction in nerve conductivity may not constitute material impairment. Moreover, an occupational, transitory, non-progressive and/or non-intensive coughing reaction may represent nonmaterial impairment. Major intensification of some of these factors could result in a health effect which represents material impairment of health. Consequently, general considerations can be stated but they must be applied on a case-by-case basis taking into account the scientific evidence, public comments and agency expertise.

For the substances OSHA is regulating as carcinogens, it has met all requirements of IUD v. API and has acted consistently with 29 CFR 1990. Specifically, OSHA reviewed all data to determine whether there were studies of sufficient merit to determine that the

substance was qualitatively a carcinogen.

Secondly, appropriate risk assessments were performed where the scientific data permitted. For most of the carcinogens, OSHA contracted with Dr. Nathan J. Karch, President of Karch & Associates, Inc., consultant experts in risk assessment, to analyze the available studies for two purposes; first to determine whether there was sufficient evidence to perform a quantitative risk assessment or to state the reasons why there was not; second, to perform a quantitative risk assessment where the studies permitted, using techniques generally accepted by the scientific community. The risk assessments are presented in this preamble.

The risk assessment for asphalt fumes was performed by OSHA scientists. The risk assessment for perchloroethylene was performed by Dr. Dale Hattis. All these assessments are discussed in this preamble.

For other substances, significant risk determinations were made directly from the studies themselves. They indicate the levels where significant risk exists and where it is eliminated. Appropriate safety factors are incorporated.

Accordingly OSHA believes that the type of significant risk analysis undertaken in this rulemaking both for carcinogens and non carcinogens is most consistent with the studies generally available and is a valid scientific approach. OSHA concludes it is fully consistent with the requirements of the Supreme Court in IUD v. API.

OSHA is utilizing its priority setting authority in another respect. There are a few substances (both carcinogens and non carcinogens) where more detailed analysis of the evidence might in the future lead to the conclusion that there is remaining significant risk. If that were the case in a single substance rulemaking, OSHA would explore that issue in great depth and do much more extended economic analysis of several different exposure levels to determine what the lowest feasible level might be.

Past experience has shown this to be a major undertaking both from a health and economic point of view. OSHA, for example, spends an average of \$500,000 and takes one year of study to determine the lowest feasible level for a single substance. OSHA does not have the resources to engage in that kind of analysis for more than a few substances. The attempt to do so in this rulemaking would significantly reduce the chances of it ever being completed and would result in far more workers being exposed to significant risk in exchange

for the incremental risk reduction attained by further lowering the PEL for a small group of substances in this

Rulemaking.

In this rulemaking OSHA's priority is to extend coverage of more protective PEL's for hundreds of substances to all workers in construction, maritime and agriculture. That will achieve far greater overall health benefits for workers than fine tuning exposure limits for a few substances. OSHA, where appropriate, will consider such adjustments in the light of legal requirements in the first update of the PEL's as discussed above.

OSHA concludes this is both rational priority setting and a reasonable integration of its priority setting authority and relevant case law. Clearly multi-issue and multi-substances rulemaking require a different balancing than single substance or single issue

rulemaking.

OSHA feasibility determinations are based on both the statute and on a consistent and extensive body of case law extending over its entire history. In addition to ATMI (supra) see for example: AFL-CIO v. Hodgson, 499 F. 2d 487 (D.C. Cir., 1974); Society of Plastics Industries v. OSHA (SOCMA), 509 F. 2d 1301 (2d Cir., 1975); American Iron and Steel Inst. v. OSHA (AISI), 577 F. 2d 825 (3rd. Cir., 1977); United Steelworkers v. Marshall, 647 F. 2d 1189 (D.C. Cir., 1980); ASARCO v. OSHA, 748 F. 2d 483 (9th Cir., 1984) and others.

Standards may be expensive and still be feasible if necessary to protect

occupational health.

Standards may be economically feasible, though from the standpoint of employers, they are financially burdensome and affect profit margins adversely. Nor does the concept of economic feasibility necessarily guarantee the continued existence of individual employers. It would appear to be consistent with the purpose of the Act to envision the economic demise of an employer who has lagged behind the rest of industry in protecting the health and safety of employees " " (Hodgson; 499 F. 2d at p. 478)

An OSHA standard may be technology forcing. OSHA may demonstrate feasibility by showing that only a few plants are now in compliance. Moreover, a standard is still feasible even though some respirator use is needed to achieve compliance.

[T]he Secretary is not restricted by the status quo. He may set standards which require improvements in existing technologies or the development of new technology * * * [SOCMA, 509 F. 2d at p. 1309].

The experience at (2) batteries provides a sufficient basis for the Secretary's reasoned belief that the 0.15 mg/m³ limit could be met (for the entire industry) (AISI, 577 F. 2d at p. 834; See also SOCMA, p. 1309).

The limited respirator use that the standard requires does not in any way render the standard infeasible * * * (ASARCO, 746 F. 2d at p. 483. See also ATMI generally and SOCMA 509 F. 2d at p. 1310, etc.)

OSHA must show a general presumption of feasibility in most operations in an industry with engineering controls to place the burden of proof in enforcement action on the industry to show that compliance with engineering controls cannot be attained in a particular circumstance. But a showing by a particular industry that compliance requires respirators in certain operations or an admission by OSHA that is the case does not make a standard infeasible. Rather it "will reduce the strength of the presumption a firm will have to overcome on justifying its use of respirators" in an enforcement or variance action. United Steelworkers, pp. 1272-73. See also Building and Construction Trades (Supra). OSHA has indicated in the feasibility analysis various operations where respirator protection may be the appropriate method of protection in some circumstances. When OSHA has stated that, OSHA would not site for failure to use engineering controls unless in the specific circumstances there was a simple engineering control available which was widely known in the

Finally the standards themselves require the use of engineering controls when feasible. If they are not feasible, the employer may use respirators. Consequently, this standard does not become infeasible simply because engineering controls may not achieve the PEL in a specific operation.

In this rulemaking, OSHA concludes that it has demonstrated feasibility without taking that concept to the full limits of its legal authority. Many of the substances regulated constitute acute hazards with apparent thresholds; the limit set to protect health does not approach the limits that could feasibly be achieved. Since OSHA's feasibility analyses are based on what industry is already achieving or what could be achieved with standard "off-the-shelf" technology, there are few if any cases where OSHA is attempting to force technology.

As discussed in the economic feasibility section below, the cost of this standard is low in relation to the sales and profits of each subsector.

Consequently OSHA believes that this standard meets the test for economic feasibility as discussed in much greater length below.

To clarify, OSHA is opening the record for general industry only for asphalt fumes, mineral wool and

fiberglass (including RCF's). For construction and maritime OSHA is only opening the record for those substances which it is proposing to change the PEL or add a new PEL for the first time. This is approximately 380 substances. The number varies slightly among the sectors depending upon whether the prior standards were the 1970 TLV's or the 1971 PEL's. It includes those substances for which OSHA changed PEL's in the 1989 final standard for general industry and those single substance standards in §§ 1910.1001-1048 which had not been made applicable to construction or maritime but had PEL's. (The 13 carcinogens (§ 1910.1002-1016) are not included because they do not have exposure limits). For those single substance standards which do not already apply to construction or maritime, only the exposure limit is being made applicable-not ancillary provisions. This rulemaking for reasons stated above, only covers exposure limits-not ancillary provisions. OSHA is not opening the record for the appropriate 200 substance already applicable to construction and maritime where OSHA is not proposing to change limits. This includes not opening the record for substances which OSHA proposed changing for general industry but determined that change was inappropriate during the air contaminants rulemaking.

For agriculture, OSHA is opening the record on every substance since no limits are now applicable. There accordingly are health write-ups for 160 substances which will be made applicable to agriculture for which OSHA did not reopen the record for general industry, and for which OSHA is not opening the record for construction and maritime. There are also write-ups for the substances which were considered and not changed for general industry, and which have not been opened for maritime or construction but which OSHA is proposing to cover for agriculture. Finally there are brief health write-ups for the substances listed in 1910.1001-1048 which are not applicable to agriculture, but for which OSHA is proposing that the PEL's cover agriculture. For each of these, OSHA is putting in the docket the final preamble for those substances which OSHA incorporates by reference as part of its health analysis.

OSHA is proposing in this standard to make the Z table cotton dust limit of 500 μ g/m 3 vertical elutriator or 1 mg/m 3 personal sampler applicable to agriculture and to cotton gins. OSHA's 1978 cotton dust standard for cotton gins

(29 CFR 1910.1046 (1974)) was vacated by the Fifth Circuit in *Texas Ind. Ginners Assoc.* v. *Marshall*, 630 F. 2d 398 (1980). That standard specified work practices and medical surveillance, but did not specify an exposure limit. OSHA

never appealed.

The Fifth Circuit's decision was prior to the Supreme Court's decision upholding the cotton dust standard for the textile industry in ATMI v. Donovan (supra). The Tex. Ind. Ginners decision was based in principle part on OSHA's failure to perform a cost benefit analysis and on a finding that acute reductions in lung function were not material impairments of health. The Supreme Court in ATMI held that OSHA was not to use cost benefit analysis to determine whether to issue health standards and that the acute effects of cotton dust were material impairments of health. Accordingly OSHA concludes it has authority to propose this cotton dust standard covering agriculture and gins.

The OSHA Air Contaminants standard for general industry is being challenged in the case of AFL-CIO v. OSHA, Nos. 89-7185 et al, before the Eleventh Circuit Court of Appeals. Currently pending are nine suits by industry challenging as too low the exposure limits for seven chemicals (perchlorothylene, nickel carbonyl, carbon monoxide, sulfur dioxide, welding fumes and nitrogen dioxide). The AFL-CIO in the tenth suit is challenging as too high exposure limits for fifteen chemicals (methyl bromide, methyl chloride, TDI, crystalline silica, mineral oil, chloroform, wood dust, mbutyl glycidal ether, m-hexanone, perchoroethylene, sulfur dioxide, carbon tetrachloride, vinyl bromide, trichloroethylene and gasoline). The petitioners also challenge the standard on several more general aspects. Eighteen other law suits were filed. Fifteen were settled and withdrawn, three were voluntarily withdrawn.

OSHA believes its decisions and approach are correct and has so argued to the Eleventh Circuit. If during the course of this rulemaking, the Eleventh Circuit remands any of the challenged substances to OSHA for further consideration on health issues, OSHA will probably withdraw those substances from this rulemaking and combine their consideration with the remand consideration for general industry. OSHA, if the Eleventh Circuit permits, would prefer that consideration to take place in the first update proceeding discussed above.

OSHA has committed to reconsider the carbon tetrachloride, vinyl bromide, trichloroethylene and gasoline PEL's for general industry in the first update. It will at that time, reconsider them for construction, maritime and agriculture as well. OSHA believes in this rulemaking, its priority is to concentrate on issuing more protective limits for these sectors, and refinements should await the first update. OSHA believes that the AFL-CIO challenges to OSHA's failure to issue final asphalt, fiberglass and mineral wool standards in the general industry rulemaking have been made moot by OSHA's proposing levels for those substances for all sectors in this rulemaking.

III. Glossary

The following terms and acronyms appear in the standard and the preamble supporting it. This glossary is provided as a convenience to the reader.

ACGIH—The American Conference of Governmental Industrial Hygienists is a professional society devoted to the development of administrative and technical aspects of worker health protection. Membership is limited to professional personnel in governmental agencies or educational institutions engaged in occupational safety and health programs. The ACGIH issues guidelines and recommendations in the form of Threshold Limit Values (TLV^Rs) which are published annually.

CAS—The Chemical Abstracts
Service (CAS) Registry Number is a
numeric designation assigned by the
American Chemical Society's Chemical
Abstracts Service which uniquely
identifies a specific chemical compound.
This entry allows one to conclusively
identify a substance regardless of the
name or naming system used.

CHRIS—The Chemical Hazards
Response Information System was
developed by the U.S. Coast Guard in
cooperation with the National Academy
of Sciences to provide information on
the handling and disposal of toxic
substances. CHRIS consists primarily of
the Hazardous Chemical Data Manual
which contains chemical, physical and
health hazard data on approximately
600 hazardous chemicals and
substances; and a Hazard Assessment
Computer System in an extensive data
base of the information contained in the
Hazardous Chemical Data Manual.

HSDB—The Hazardous Substances
Data Bank, a part of the National
Library of Medicine System, will soon
be available on OSHA's Computerized
Information System (OCIS). This data
bank, currently available through
TOXNET, contains health and safety
profiles for over 4100 chemicals. It
includes 144 data elements in 10
categories including use information,
substance identification, animal and
human toxicity, environmental fate,

standards, personal protective equipment, fire, physical and chemical properties.

IARC—The International Agency for Research on Cancer (IARC) is a research organization authorized by the World Health Organization in 1965. IARC's mission is to study the causes of cancer in the human environment. IARC has published (and continues to update) a series of monographs on a substantial number of toxic chemicals and substances in which the carcinogenic risk of these chemicals is evaluated.

ILO—The International Labour Organization (ILO) is a specialized agency associated with the United Nations. Established in 1919 as part of the Versailles Peace Treaty, the ILO serves to band together governments, employers, and workers of 145 nations in an international effort to improve overall working conditions and to protect the life and health of workers.

IMIS—The Integrated Management Information System (IMIS) is a data base developed by OSHA in 1979 with sampling information on more than 100,000 individual measurements. The IMIS contains exposure measurements obtained by OSHA compliance officers during thousands of health inspections; it is the most extensive data base of its kind.

Material—The term "material" is used in the original standard whereas "substance" is used in the revision. The meaning is the same.

MSDS—The Material Safety Data
Sheet (MSDS) is a compilation of data
and information on individual
hazardous chemicals produced by the
manufacturers and importers of that
chemical, as required by OSHA's
Hazard Communication Standard, 29
CFR 1910.1200. An MSDS contains data
on chemical identification, current
exposure limits, chemical reactivity, fire
and explosion limits, and information on
health hazards and emergency
procedures, spill, leak, and disposal
procedures, and any needed special
protection or precautions.

NIOSH—The National Institute for Occupational Safety and Health (NIOSH) was created by the Occupational Safety and Health Act of 1970. NIOSH is part of the Centers for Disease Control under the Department of Health and Human Services. Its mandate includes conducting research in developing criteria and/or recommendations to be used in setting occupational exposure standards, identifying and evaluating workplace hazards, measurement techniques, and control technologies, and providing

professional education as well as health

and safety information.

NOES-The National Occupational Exposure Survey (NOES) is a data base completed in 1982 by NIOSH. NOES is the successor to the first such data base, completed by NIOSH in 1974, and known as the National Occupational Hazard Survey (NOHS). The NOES data base contains a sample of the number of persons exposed by substance and industry from approximately 4500 businesses in 98 geographic areas in the U.S. These surveys provide national estimates of potential exposure to workplace hazards, by industry and occupational group.

OCIS—The OSHA Computerized Information System is a comprehensive data base that contains information and data on standards interpretation, chemical information, hazardous waste activity, 5(a)(1) citations, a health hazard evaluation index, training materials, and other information compiled by OSHA on subjects related to occupational safety and health.

OSHA HS Number—A Health Standard (HS) number is a 4-digit code assigned, for ease in reference, to each of the hazardous substances or chemicals considered for change of PEL

in this rulemaking.
PEL—Permissible Exposure Limits (PELs) are limits developed by OSHA to indicate the maximum airborne concentration of a contaminant to which an employee may be exposed over the duration specified by the type of PEL assigned to that contaminant.

REL-Recommended Exposure Limits (RELs) are issued by NIOSH to aid in controlling hazards in the workplace. These limits are generally expressed as 8- or 10-hour TWAs for a 40-hour workweek and/or ceiling levels with time limits ranging from instantaneous to 120 minutes. RELs are published in a

variety of NIOSH documents.

RTECS—The Registry of Toxic Effects of Chemical Substances (RTECS) is a data base that lists an identification number, synonyms, Department of Transportation (DOT) hazard label information, EPA Toxic Substances Control Act (TSCA) information, OSHA and Mine Safety and Health Administration (MSHA) air exposure limits, and animal and human toxicologic data.

Substance-The term "substance" is used in the revised standard whereas "material" is used in the original. The

meaning is the same.

TLV—The Threshold Limit Value (TLV) is a registered trademark for an exposure limit developed by the American Conference of Governmental Industrial Hygienists (ACGIH). A listing

of TLVs may be found in the ACGIH's Documentation of the Threshold Limit Values and Biological Exposure Indices for 1988-1989." TLVs may be stated as a time-weighted average (TLVR-TWA), a Short-Term Exposure Limit (TLVR-STEL), or a Threshold Limit Value Ceiling (TLVB-C). OSHA utilized the 1987-88 TLVs as a starting point for this rulemaking.

TSCA-The Toxic Substances Control Act (TSCA), administered by the Environmental Protection Agency (EPA), was passed by Congress to protect human health and the environment by requiring testing and necessary use restrictions to regulate the commerce of certain chemical substances.

WHO—The World Health Organization (WHO) is part of the United Nations. WHO's programs in occupational health include development of an occupational health information system, criteria for early detection of health impairment, and the development of internationally recommended health-based permissible exposure limits for occupational exposure to toxic substances.

IV. Health Effects Discussion and **Determination of Proposed PELs**

A. General Principles of Toxicology and Dose Response Introduction

As long ago as the 16th century. people recognized that there is no such thing as an absolutely safe chemical. The Swiss physician Paracelsus, who lived from 1493 to 1541, said:

All substances are poisons; there is none which is not a poison. The right dose differentiates a poison and a remedy.

On the other hand, methods have been devised to permit any chemical, no matter how poisonous, to be handled safely; this is done either by limiting the dose or controlling the exposure. However, before the necessary degree of control can be determined for a particular exposure or situation, the toxicity of the substance in question must be known. The paragraphs that follow describe the methods used by scientists to measure the relative toxicity of substances and to select exposure limits that will prevent exposed individuals from suffering adverse effects from such exposures. As this discussion demonstrates, methods of choosing exposure limits must, because of the lack or inadequacy of dose-response information for many chemicals, rely on experience in the use of these substances and on scientific and professional judgment.*

Chemicals range in inherent toxicity from those that are relatively harmless even after large doses have been administered to others that cause death if encountered even in small quantities. Toxicologists rank chemicals by categories that range from practically nontoxic (an adult human would have to consume a quart) to supertoxic (fewer than 7 drops would be lethal for most people).

In the occupational setting, it is the risk associated with a particular use of a chemical rather than its inherent toxicity that is important. Risk can be defined as the probability that a substance will produce harm under certain conditions of use. The converse of risk is safety, which is the probability that no harm will occur under specific circumstances.

The degree of hazard associated with exposure to a specific substance depends on the manner in which it is handled in a particular situation: a supertoxic chemical that is processed in a closed, isolated system may be less hazardous in actual use than a lowtoxicity compound handled in an open batch process. Another factor affecting the ability of a chemical to elicit a toxic response is the susceptibility of the biological system or individual. To identify the relative degree of hazard in a particular instance requires knowledge about the chemical agent, the exposure situation, and the exposed subject. In addition, the route of administration and the duration and frequency of exposure must be known.

Route of Exposure

There are four principal routes of exposure by which toxic substances can invade humans or animals. These are inhalation, ingestion, dermal absorption, and parenteral administration (i.e., administration through routes other than the intestinal canal, e.g., by subcutaneous, intramuscular, intravenous, or intratesticular injection). The route of administration of a toxin also affects the relative toxicity of the agent. For example, a chemical that can be detoxified in the liver will be less toxic if it is administered orally than if it is given systemically (i.e., inhaled). Studies that provide information about the relative toxicity of an agent via different routes of exposure can provide a considerable amount of information about the absorbability of the agent. For example, if exposure to a certain dose of a chemical via all routes of administration causes death within the same time period, it can be assumed

^{*}The material in this section derives principally from the following sources: Klaasen, Amdur, and

Doull 1986; National Research Council 1986; Cohen 1988a,b; and Tardiff and Rodricks 1987.

that the substance in question is easily and rapidly absorbed. On the other hand, if the dermal dose of a chemical that is required to kill a subject is much higher than the dose required to produce the same effect when the chemical is ingested, one can deduce that the skin provides, to some degree, a barrier against that agent's toxicity. Other, less important, elements affecting the response to a toxic substance include the relative concentration of the substance, the volume of the vehicle used to administer the chemical, the chemical and physical properties of the vehicle, and the dose rate (i.e., the period of time over which the dose is administered).

Duration and Frequency of Exposure

Scientists conduct animal experiments that involve four different types of exposure: acute, subacute, subchronic, and chronic. Acute exposures are limited to periods of less than 24 hours and can involve either single or repeated exposures within that period. Subacute exposures are repeated exposures that last for one month or less, while subchronic exposures have a duration of one to three months. When a research project having a chronic regimen is conducted, the test animals are dosed repeatedly for a period lasting more than three months. Animals exposed acutely can have both immediate and delayed-onset responses. Similarly, chronic exposures can cause immediate reactions as well as long-term effects.

The frequency of dosing also has an important influence on the magnitude of the toxic effect: A large single dose of an acute toxin will usually have more than three times the effect of one-third the dose given at three different times, and the same dose administered in 10 or 15 applications might have no effect whatsoever. The pattern of dosing is important because it is possible for some of the substance to be excreted between successive administrations or because the lesion caused by the toxin has a chance to be partially or completely repaired between applications. Thus a chronic effect is said to occur: (1) If a toxic substance accumulates in the system of an exposed person or animal because the dose absorbed is greater than the body's ability to transform or eliminate the substance; (2) if it produces adverse effects that are not reversible; or (3) if it is administered in a manner that permits inadequate time for repair or recovery.

Variation in Response

Responses to toxic insults vary in a number of ways. For example, some toxicants have immediate effects, while others are associated with delayed symptom onset. The latency period for carcinogenic agents may be as long as 40 years for some types of cancer, and even some acute agents, such as some chemicals that have adverse ocular effects, may not cause overt symptoms until hours after exposure.

Another difference in type of response concerns the reversibility or irreversibility of the effect. Reversibility depends on the site of action as well as the magnitude of the insult. That is, some tissues of the body, such as the liver, have considerable ability to regenerate; others, like the kidney or central nervous system, do not.

The site of action associated with toxic substances also varies widely. Local effects are those lesions caused at the site of first contact between the agent and the organisms. Examples of localized effects are skin burns caused by contact with a caustic substance and site-of-contact tumors that develop at the locus of the injection of the

carcinogen.

In contrast to localized effects, systemic effects involve the absorption and distribution of the toxic agent from the point of entry to a distant site; the toxic response is manifested at this distant point. An example of a systemic poison is mercury, which produces its toxic effect on the central nervous system. Often, the site of deposition for a chemical is not the organ system most affected by the toxin. For example, although lead is deposited and concentrated in the bone, it affects the central nervous system. Any sites that are adversely affected by the toxic effects of exposure to a substance, whether they are sites of contact or distal sites, are called the target organs of toxicity.

In cases of systemic poisoning, the system most often affected is the central nervous system (CNS); it is common for the CNS to be involved even when another organ, such as the liver, is the primary target organ of toxicity. In descending order of frequency, the systems or organs most often involved in cases of systemic poisoning are the central nervous system, the circulatory system, the blood and hematopoietic system, the visceral organs (liver, kidneys, lungs), and the skin.

Dose-Response

The relationship that associates the dose of a chemical with the effects it causes is called the dose-response relationship. A single data point relating a dose to a response is sufficient to establish a dose-response relationship. As additional data become available, it is possible to expand our understanding

of the dose-response relationship to cover a range of doses or exposures. Dose-response is an important principle in toxicology, and an understanding of dose-response is important in establishing occupational or other exposure limits. Knowing how toxic substances act makes it easier to predict the potential effects of exposure. It is generally true that lowering dose reduces response; however, although data are often available to demonstrate that lower doses reduce responses on the grossly observable level, data showing that more subtle responses (e.g., those at the subcellular level) have been reduced are rarely available.

To apply dose-response relationships, it is helpful if several types of data are available. First, it must be possible to relate a response to a particular chemical. Although basic data pointing toward causality may be available, it is often difficult to refine the doseresponse relationship further. For example, epidemiological studies often identify an association between a disease and one or more causative agents. However, since information on the precise identity of the etiologic agent, the actual dose received, and the true site of the response is usually not available, it is often impossible to use data from epidemiological studies to establish a precise dose-response relation between a specific dose of a toxin and an effect.

The second condition to be met before dose-response can be established is that it must be possible to relate the response to the dose. It is relatively easy to determine that a large dose causes an obvious response. Refining the relationship, however, involves three other requirements: (1) That there be a receptor site; (2) that the response and the intensity of the response be related to the concentration of the toxin at the receptor site; and (3) that the concentration of the toxin at the site be related to the dose given.

The third principle underlying the measured toxicity. Although lethality in sequence of molecular events occurring methods are available. For example, it is

concept of dose-response is that there must be a quantifiable means of measuring the toxicity of a substance and a method of expressing this test animals is often used to measure toxicity, the best form of measurement would involve quantification of the during the toxic response. In the absence of such endpoints, other good common to measure an effect believed to be related to the substance in question. The level of activity of an enzyme in the blood is often used as a

measure of effect, e.g., serum glutamicoxaloacetic transaminase (SGOT) levels are used to measure liver damage. Many different endpoints can be used to measure toxic effects, such as changes in muscle tone, heart rate, blood pressure, electrical activity of the brain, motor functioning, and behavior.

The most widely used endpoint, especially when a new substance is

involved, is lethality in an animal test system. Lethality studies allow scientists to make comparative assessments of a chemical's toxicity as it relates to that of many other substances. Research of this type also permits the gathering of essential information on dose, duration, route of administration, site of action, and the target organ of toxicity.

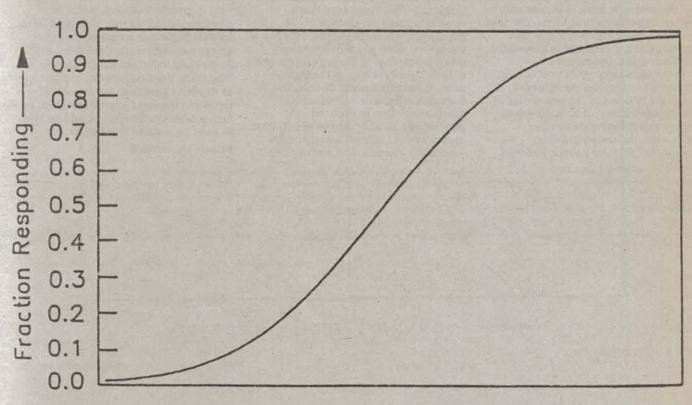

Form of the Response

The classic form of dose-response is sigmoidal (Figure 1). This form characterizes the relationship between the amount of a toxin administered and the degree of response to that dose. The response is measured on the ordinate, and the dose is represented on the abscissa.

BILLING CODE 4510-28-M

FIGURE 1. DIAGRAM OF THE DOSE-RESPONSE RELATIONSHIP

Figure 1 Diagram of Dose-Response Relationship

BILLING CODE 4510-26-C

Dose-response can be thought of in two ways:

 As exposure increases, the proportion of the population that manifests the response increases (quantal response); and

 As exposure increases, the intensity of an individual's response increases

(graded response).

A relatively flat dose-response curve means that a large change in dose is required before there is a significant change in response. A steep curve, on the other hand, means that a small change in dose will elicit a large increase in response. Although it is sometimes possible to generate a curve of the type shown in Figure 1, it is not necessary to do so to demonstrate that exposure at a given level is associated with a particular response. That is, it is not necessary to have sufficient data to define, in mathematical terms, the doseresponse relationship to know that exposure at a given level is associated with adverse consequences.

In the regulatory context, it is most common to express dose-response relations in terms of the percentage of the population responding. However, before this information can be evaluated, the endpoint being considered must be known. For every

substance, there are several doseresponse relationships, depending on endpoint: a substance that produces irritation at low doses may cause more severe symptoms or even death at high doses and in other conditions. For example, many substances that are mucosal irritants at low doses will produce pulmonary edema and nervous system effects at high doses.

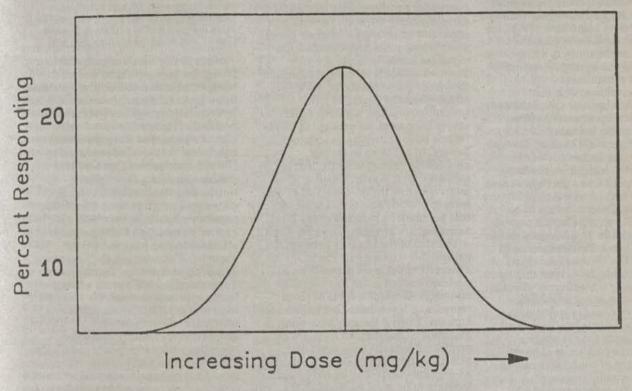

Plotting the cumulative percentage of individuals responding against dose produces the typical sigmoid curve. Such a curve reflects the fact that at the lowest dose, zero percent of the population responds, while 100 percent of the population will respond at the highest dose. However, if the percentage responding is plotted against incremental rather than total dose, the curve produced is a normal distribution (Figure 2). This curve says that a relatively small percentage of the population will manifest the response at the lowest dose and that a similarly small percentage of the population will exhibit the effect only at the highest dose. What this normal distribution of response reflects is individual and species variation in exposed populations. A wide degree of variation occurs even in inbred, homogeneous laboratory animals, and such variability

increases dramatically when a heterogeneous population, such as workers, is involved. Individuals responding at the left end of the curve shown in Figure 2 are sometimes called hypersusceptible, while those at the right end could be termed resistant. Because the relationship between dose and response is sigmoidal, response approaches zero as dose approaches zero. However, because of the mathematical form used to express this relationship, a true zero response can never be achieved. In the strictest sense. therefore, a true threshold dose level (i.e., the dose with which a zero response is associated) can never be established on the basis of experimental research. Instead, scientists attempt to define the minimum dose associated with a specific endpoint, which is customarily termed the "threshold" dose for that particular endpoint. However, unless a specific endpoint (such as respiratory irritation, cholinesterase inhibition, the development of a tumor, or death) is specified, the concept of a threshold is essentially meaningless. In fact, a separate threshold could be said to exist for each of these endpoints.

BILLING CODE 4510-26-M

FIGURE 2. DIAGRAM OF QUANTAL DOSE-RESPONSE RELATIONSHIP

FIGURE 2 Diagram of Quantal Dose-Response Relationship

BILLING CODE 4510-26-C

The extent to which an experimentally derived "threshold" actually reflects the true threshold for a substance (i.e., the level above which a response will occur and below which no response will occur) depends on several factors, such as the number of animals used to determine the experimental threshold, the number of dose levels tested, and the degree of variation represented in the test subjects. For example, to determine an LD50 (the lethal dose that will kill 50 percent of the animals tested) with a high degree of precision requires the use of a minimum of 50 test animals and five dose groups (10 animals in each group). Other factors that can influence the magnitude of the median lethal dose include the sources involved, the sex and age of the animals, the environmental conditions prevailing during the test conditions, diet, the health status of the subjects being tested, and the subjects' past exposure to other toxic substances.

In toxicological research, the experimentally observed threshold dose is called the lowest-observed-effect level (LOEL) or the lowest-observedadverse-effect level (LOAEL). Alternatively, the threshold may be expressed as the highest no-observedeffect level (NOEL), i.e., the highest dose administered and found not to produce a given response. Determination of an accurate NOEL requires both a careful interpretation of the toxicological data and the use of an adequate number of test animals. The National Academy of Sciences (1985) has concluded that the chance of finding a no-adverse-effect level (that is, of missing an adverse effect) at a given dose is statistically greater in experiments having a small number of animals than in studies involving a large number of animals. Thus, the degree of confidence one has that a NOEL actually represents a "safe" dose, rather than a research design artifact, increases with the number of animals tested. The greatest degree of confidence is associated with studies involving a large number of animals that were tested at several doses that were administered at close intervals.

In a recent publication (Tardiff and Rodricks 1987), David W. Gaylor of the National Center for Toxicological Research explained that experimentally derived thresholds represent statistical limitations in study design rather than biological characteristics:

The existence of dose-response relationships might lead one to assume incorrectly the existence of threshold doses below which no toxic effects could occur. As desage is decreased, the prevalence of an observable toxic effect * * * diminishes to

zero. Eventually, a dosage is reached below which the experiment has essentially no resolving power to distinguish between the spontaneous background rate and small induced toxic effects *

If no toxic effects are detected at a specified dosage, this dosage is called the noeffect, or more correctly the no-observedeffect dosage. Because of the limitations of any given experiment, the no-observed-effect dosage is not a precise estimate of a true noeffect level. Lack of statistical significance is not equivalent to no toxic effect. It may or may not be, and further experimentation would be required to resolve this equivocal issue.* * * The no-observed-effect level is not a biological property, but, rather, a statistical property or operational threshold that is highly dependent on sample size.

The scientific issues surrounding the concept of no-observed-effect levels or experimentally derived thresholds have important implications for their use in establishing protective occupational exposure limits. Because the noobserved-effect level cannot represent the "true" threshold for an adverse effect, given the design of most toxicologic studies, regulators and others have used the concept of safety factors (also known as uncertainty factors) to aid them in setting permissible exposure limits; that is, the exposure limit is established at some interval below the no-observed-effect level to provide additional assurance that populations exposed at the level permitted are not likely to suffer harm.

The size of the interval between the permissible exposure limit and the noobserved-effect level depends on a professional judgment as to whether the no-observed-effect level is likely to represent a level that is not harmful to humans. Thus, if the available data include a NOEL derived from a wellconducted human study, a smaller safety factor might be used to establish an exposure limit than would be used if the data to be used to establish the limit consisted of a NOEL from an animal study; in the latter case, there is greater uncertainty regarding the relationship between the animal NOEL and human NOEL. Safety factors have also been used to recognize the fact that the human population is heterogeneous and that there may be a wide variation in individual responses to toxic substances (the wide range in the odor thresholds reported for some substances is a good illustration of individual variability in response).

The use of NOELs, LOAELs, and safety factors to develop permissible exposure limits is not a recent

development:

For more than half a century, evaluation of the safe use of chemicals has been focused mainly on the development of toxicity data

and on the application of professional judgment to the ad hoc interpretation of such data to derive acceptable levels of exposure for humans. Generally, this practice has taken the form of identifying from studies in laboratory animals the no-observed-effect level and dividing it by a safety factor (usually 100 for NOELs derived from chronic studies) reflecting the uncertainties of relating data to humans under their conditions of exposure and the quality and appropriateness of the data base *

Safety factors are usually chosen prospectively to address the uncertainties of interspecies extrapolation. Although safety factors as small as 2 and as large as 2000 have been used * * * the safety factor of 100 is used most commonly, at least for NOELs derived from chronic toxicity studies, and incorporates adjustments for interspecies variability (usually 10) and intra-human variability (usually 10) * * *. The resulting value is equivalent to a NOEL in humans (Tardiff and Rodricks 1987, pp. 391, 421).

Many toxicologists urge that safety factors be used with care and interpreted with caution; they note that these factors "often create the [erroneous] impression that human population thresholds have been identified and that there is virtually no risk below that level of exposure" (Tardiff and Rodricks 1987, p. 421).

Although safety factors have traditionally been used to establish exposure limits for chronic or lifetime exposure situations, they have also been applied to establish limits for acute effects resulting from short-term exposure. For example, the National Academy of Sciences' Committee on Toxicology has been using a safetyfactor approach to establish emergency exposure guidance levels (EEGLs), which are exposure levels judged to be acceptable for military personnel operating under emergency conditions. Exposure at an EEGL concentration would not be considered safe for routine or normal operations, but such exposures would be considered acceptable for performing tasks that would prevent even greater risks (e.g., death or injury caused by fires or explosions). When developing EEGLs. safety factors are used to account for uncertainties in the use of animal data and when extrapolating between different dose routes. The NAS also develops short-term public emergency exposure guidance levels (SPEGLs) that estimate acceptable levels of exposure for the general public during airborne chemical releases; SPEGLs are generally set at levels of one-tenth or one-half the EEGL (i.e., at levels incorporating an additional safety factor of from 2 to 10) (Criteria and Methods for Preparing Emergency Exposure Guidance Level (EEGL), Short-Term Public Emergency

Guidance Level (SPEGL), and Continuous Exposure Guidance Level (CEGL) Documents. Washington, DC: National Academy Press, National Academy of Sciences 1986).

In the prior air contaminants rulemaking, the use of the safety factor approach in establishing occupational exposure limits was addressed by many commenters (Exs. 3-744, 3-1095, 8-16, 8-47, 116, and 144; Tr. 1-221, Tr. 2-163 to 2-164). NIOSH (Ex. 8-47) pointed out that, since safety factors cannot be used to estimate human risk, they should not be interpreted as relating to the magnitude or significance of a risk; instead, as NIOSH notes, safety factors are intended only to reflect uncertainty in the available data. This comment echoes the concern expressed above, i.e., that safety factors should not be misinterpreted as identifying a human population threshold. NIOSH (Ex. 8-47) also endorsed OSHA's use of safety factors in generic rulemaking, noting that this approach is a "pragmatic method" of developing standards (except when a nonthreshold process, such as the induction of cancer, is the outcome of concern).

Dr. Marcus Key, Professor of Occupational Medicine at the University of Texas School of Public Health, also testified in the earlier rulemaking on the appropriateness of using safety factors to establish occupational exposure

We seldom, if ever, know with any precision where a significant risk level begins or ends; hence, the need for safety factors. Safety factors depend on several considerations, * * * * mainly on toxicity and the nature of the health effects, but also on the availability of scientific evidence of effects at lower levels.

Professional judgment must be relied on in selecting safety factors, with one to three orders of magnitude being commonly used for serious effects, and 50 percent, or [a] safety factor of 2, [being used] for acute, less harmful effects (Tr. 1–221).

Both Dr. Key (Tr. 1-221) and Dr. Ernest Mastromatteo, Chairman of the ACGIH TLV Committee (Tr. 2-163 to 2-164), testified that safety factors are frequently used by the American Conference of Governmental Industrial Hygienists to develop recommended exposure limits.

Other commenters in the earlier rulemaking (Exs. 8–16, 116, and 144; Tr. 7–121) urged OSHA to adopt a uniform system of assigning safety factors to establish permissible exposure limits. These participants suggested that OSHA apply the Reference Dose approach used by the Agency for Toxic Substances and Disease Registry or by the Environmental Protection Agency to

calculate PELs for the Z-table substances. In response to these commenters, OSHA stated (54 FR 2399) that the Agency's approach has involved an evaluation of the efficacy of the proposed rule's limits on a case-by-case basis. OSHA believes that, at this time, this case-by-case assessment is the best way to establish new and revised limits for the numerous substances addressed in this proposed rulemaking.

Types of Toxicological Evidence

The evidence available to scientists who wish to evaluate the toxicity of a substance can be derived from studies in laboratory animals, in-vitro studies in cell or tissue systems, reports of clinical observations, studies of exposed human populations, or intervention studies conducted with human volunteers. The preceding paragraphs have described animal studies (or "bioassays"). The following section discusses the two most common types of human evidence: data derived from clinical observations and information from epidemiological studies.

Clinical Observations

Much of the data on the toxic effects associated with human exposures has come from industrial accidents, fatal poisonings, or other such tragedies. This information is generally more useful in delineating broad categories of pathological effects than in refining a specific dose-response relationship, because the exposure levels causing the accident are known to be high but cannot be quantified with precision.

Epidemiological Studies

Studies conducted by epidemiologists are designed to reveal the patterns of disease or mortality prevailing in certain groups of people (usually workers) exposed to a single toxin or to a group of substances. One of the advantages of epidemiological studies is that they involve humans and their responses to actual situations. The interpretation of the results of epidemiological studies is complicated by the inevitable presence of confounding variables that occur whenever human populations are involved. Ideally, the populations being studied (i.e., the study population and the control population) should be fully comparable with regard to every variable except the single characteristic under study. Because it is rarely possible to achieve this degree of comparability, statistical techniques are often used to attempt to adjust for this lack of comparability. In addition, if the measured effect is relatively large, it is unlikely that confounding factors will obscure the true picture.

Broadly speaking, epidemiological studies can have two possible outcomes: They can report an effect or they can report no effect; in the former case, the study is termed a positive study, and in the latter, a negative one. Within each of these categories, it is possible for the study to be correct (that is, to give a true-positive or true-negative result) or to be incorrect (that is, to give a falsepositive or a false-negative result). A false-positive result reports that there is an increased risk when in fact there is not, and a false-negative study reports that there is no increased risk when in fact there is.

The probability that a study will detect a statistically significant effect if that effect is actually present is called the power of the study. As the power of a study increases, the likelihood of producing a false-negative error decreases. Power is dependent on two factors: the level of relative risk being evaluated and the number of cases of the effect (i.e., disease) that are expected in the population being studied. The number of expected cases depends both on the sample size and the expected disease frequency in the comparison population. For example, a study involving a small population and a common disease can have the same power as a study of a rare disease in a large population. Consequently, studies of larger samples have sufficient power to detect smaller increases in risk, and studies of smaller samples will be able only to detect large increases in relative risk.

Because epidemiological studies have limitations, it is essential that the power of such studies, particularly of negative studies, be examined to ensure that their sample sizes are adequate to detect the absence of increased risk with validity. When the power of a study is not adequate, negative studies cannot be said either to contradict or to support the conclusion that increased risk exists. Essentially, a negative epidemiologic study identifies a NOAEL, which, as discussed above, reflects the statistical limitations of a study more than the "true" population threshold for an effect. However, a study with a positive result may indicate a relationship if the excess risk is high, even if the study's sample size is small and the effects of some factors are not controlled for.

Quality of Evidence

Dose-response models have often been used in the quantitative assessment of the risks associated with exposures to carcinogenic substances. However, less scientific effort has been devoted to models to be used with noncarcinogenic substances.

Mathematically precise methods to establish the true no-effect level or to define the dose-response curve have not been developed for most of the more than 400 substances involved in this

rulemaking.

Most of the scientific work that has been done was designed to identify lowest-observed-effect or no-effect levels for a variety of acute effects. As described above, experts in industrial hygiene and occupational health have developed factors to be used to offset, at least to some extent, the insensitivity of NOELs and LOELs to such factors as subcellular effects, sensitive individuals, and chronic exposure. It is possible to use these data, combined with professional judgment and OSHA's expertise and experience, to determine that significant risk exists at current levels of exposure and that a reduction in these levels will substantially reduce this risk of material impairment of health. OSHA is also confident that it is not attempting in this rulemaking to reduce exposures to insignificant levels. However, additional analysis may well reveal that the levels being proposed can be refined further in the future.

B. Historical Development of Occupational Exposure Limits

Early Limits

Until the development of occupational health standards, the occurrence of adverse health effects resulting from exposures to hazardous substances or conditions in the workplace could only be determined ex post facto-after material impairment had already occurred to the health and welfare of exposed employees. For example, in her 1910 studies of lead poisoning, Dr. Alice Hamilton was forced to rely on "personal observations of working conditions and the illness and deaths of workers to demonstrate the existence of harmful exposures" (Paull 1984/Ex. 1-255). The concept of occupational exposure limits thus represents a dramatic breakthrough in the battle against occupational disease, and these limits remain "one of the most useful and indispensable tools yet devised for safeguarding the health and well-being of industrial workers" (Thomas 1979/Ex. 1-96). Occupational exposure limits are air quality values that apply in workplaces, and they are derived by studying the correlation between the amount of a toxic substance absorbed by the body and its effects on health. Within the context of occupational exposure, knowledge of this relationship permits quantification of the etiology "of a large number of occupational health

impairments, [evaluation of] the risk of such impairments and, if necessary, [consideration of] the effectiveness of preventive measures" (Parmeggiani 1973/Ex. 1-229). More specifically, an understanding of the levels at which disease or other adverse health effects occur can be used to establish limits for occupational exposure that reflect concentrations below which health hazards are unlikely to occur in most workers.

The historical development of occupational exposure limits began with the published reports of a German scientist whose investigations in 1883 into the effects on experimental animals (and on himself) of exposure to carbon monoxide at known air concentrations caused him to conclude that "the boundary of injurious action of carbon monoxide lies at a concentration in all probability of 500 parts per million, but certainly [not less than] 200 parts per million" (Cook 1987/Ex. 1-187). Shortly after the appearance of this first documented dose-response value, another German researcher, K. N. Lehmann, published a series of reports on a number of chemical substances under the title "Experimental Studies on the Effect of Technically and Hygienically Important Gases and Vapors on the Organism." This series culminated in 1936 in a comprehensive paper on chlorinated hydrocarbons, published as Volume 116 of Archiv für

In 1912, Rudolf Kobert published a table of exposure limits, based on animal studies, for 20 compounds. One of the first tables of hazardous air concentrations to originate in the United States was a technical paper published in 1921 by the U.S. Bureau of Mines. The 33 substances included in this table were those frequently encountered in the workplace. In addition to limits based on the avoidance of acute toxic effects, this table provided some information on the least detectable odor concentration and the lowest airborne concentration required to cause irritation (Paull 1984/Ex. 1-255; Cook 1987/Ex. 1-187).

Throughout the 1920s and 1930s, data became available that correlated concentrations of harmful substances with observed effects on worker health for such materials as lead and mercury compounds, benzene, and granite dusts. These early occupational health studies, which were based on animal experiments and on findings in exposed workers, provided the kind of data needed to link human exposures "to concentrations that were capable of

producing not only acute, but chronic health effects" (Paull 1984/Ex. 1-255).

After 1935, the emphasis of researchers had shifted, for the most part, from the reporting of a series of values for a range of acute effects to results that yielded a single limit based on studies of repeated exposures. Over the years, a sizable amount of data about the levels of exposure that would not produce injurious effects had been amassed for a considerable number of substances. "By the early 1940s, control of the occupational environment to prevent the harmful absorption of toxic materials was becoming an accepted principle, and the practical problem of defining what was 'harmful' was beginning to be met by employing maximum allowable concentrations" (Paull 1984/Ex. 1-255). In 1943, Sterner (Ex. 1-806) explained the meaning of the term maximum allowable concentrations as "the upper limit of concen-tration of an atmospheric contaminant which will not cause injury to an individual exposed continuously during his working day and for indefinite periods of time" (Paull 1984/ Ex. 1-255).

The first lists of maximum allowable concentrations of airborne toxic substances were issued between 1933 and 1938. The Union of Soviet Socialist Republics (U.S.S.R.) was the first country to make occupational exposure limits a statutory obligation; in 1933 the U.S.S.R. published a list that included 14 substances. The first American list was published four years later by the State of Massachusetts, and in 1938 Germany issued occupational health standards for a number of organic solvents (Holmberg and Winell 1977/Ex. 1-141). Additionally, the United States "imposed limited occupational safety and health requirements on certain contractors with the Federal government" when the Walsh-Healey Act was passed in 1936 (Mintz 1984/Ex.

Standards Developed by Professional Organizations

During the 1940s, American organizations led in the development of occupational health standards, beginning with the American Standards Association (now the American National Standards Institute, or ANSI) list of "maximum acceptable concentrations" (MACs), which appeared in 1941. This list represented a consensus of opinion by the ASA and a number of industrial hygienists who had formed the American Conference of Governmental Industrial Hygienists (ACGIH) in 1938 (Baetjer 1980/Ex. 1223). Originally conceived of as a timeweighted concentration to be maintained as an average over an entire work shift, the MAC was redefined in 1957 to mean an upper level (i.e., a ceiling concentration) that should never be exceeded (Turner 1976/Ex. 1–79).

An important contribution to occupational health standard-setting was made in 1945 by Warren Cook (Ex. 1–726), who published a list of maximum allowable concentrations for 132 industrial atmospheric contaminants. These limits had been developed by six states, the U.S. Public Health Service, and the American Standards Association, and included Cook's own list of "accepted or tentative values" based on industrial experience, animal experimentation, human sensory response, or a combination of these factors. This table was followed by

Documentation supported by 187 specific references, indicating the basis and reliability of each value. Cook was the first investigator to codify all of the available data on MAC's and present it in one publication. His list of recommended values was incorporated, practically without changes, by the ACCIH in establishing the TLVs. In support of Cook's inferences, it should be noted that 50 of the " * values that he recommended in 1945 were subsequently adopted as federal standards, and are still in use today (Paull 1984/Ex. 1–255).

The American Conference of Governmental Industrial Hygienists' Subcommittee on Threshold Limits presented its second report at the Eighth Annual Meeting of the ACGIH in 1946. The report included values for 131 gases, vapors, dusts, fumes, mists, and 13 mineral dusts "compiled from the list reported by this subcommittee * * * in 1942, from the list published by Warren Cook in * * * 1945, and from published values of the Z-37 Committee of the American Standards Association" (Cook 1987/Ex. 1–87). The Committee's report noted that:

Considerable difficulty attends the fixing of satisfactory values for maximal allowable concentrations of chemicals in respirable atmospheres because of the lack of a uniform definition of the maximum allowable concentration concept. One concept is that the M.A.C. value should represent as accurately as possible that concentration at which a worker exposed for a sufficient period of time will just escape physiological or organic injury and occupational disease.

A second concept is that the M.A.C. should represent some fraction of that concentration which will injure the worker in order to allow a margin of safety in the design of protective equipment and guard against possible synergistic effects in the case of multiple exposures. A third concept is that the M.A.C. should perform the functions of the former concepts and in addition provide a work nvironment free of objectionable but non-

injurious concentrations of smokes, dusts, irritants and odors. Obviously all of these concepts cannot be fulfilled with the establishment of a single value. M.A.C. values in use at the present time represent examples of all of these concepts. The committee feels that the establishment of dual lists or a single definition is not possible at the present time (ACGIH 1946).

The report concluded by stressing that the 1946 list of MAC values was presented "with the definite understanding that it be subject to annual revision" (ACGIH 1946).

Papers presented at both the Ninth International Congress on Industrial Medicine in London (1948) and at the Fifteenth International Congress of Occupational Health in Vienna (1966) also dealt with maximum acceptable concentrations. The first of these proposed that zones of toxicity be set up to facilitate an understanding of the relative hazards of substances, "since the boundaries of MAC values were not sharp lines of demarcation" (Cook 1987/ Ex. 1-87). At the 1966 meeting, discussion took place on the advantages of the concept of a "peak level" of exposure-an extension of the "ceiling level" notion inherent in the definition of a MAC since 1957. A "peak level" was defined as one "that can be applied to certain substances for brief designated periods and for a strictly limited number of times during the work shift, with a designated time interval between peaks. The 'peak' concept places a limit on the intermittent higher exposures that occur in many industrial operations. The time-weighted average exposure limit is of course to be observed [even when a peak has also been assigned to a substance]" (Cook 1987/Ex. 1-87).

Terminology and definitions throughout this early period were ambiguous and imprecise, reflecting uncertainty as to exactly what needed to be and could be done in the realm of occupational health standard setting. Initially, the ACCIH designated its recommended limits as "maximum allowable concentrations," although this term was often used interchangeably with "threshold limit values." Confusion about the meaning, interpretation, and relative significance of the terms being employed during this embryonic period was common. After 1953, the ACGIH defined the concept of threshold limit value in the preface to its annual published list of occupational health standards as "maximum average atmospheric concentrations * * * for an eight-hour day." Documentation for the 238 substances included in the TLV* list for 1956 was provided by Smyth (Ex. 1759) in a separate paper in which the author

Recommended that the TLVs include references to the underlying data, and that the concepts represented by the values be restated in more realistic toxicological terms. In his analysis of the TLVs, he [Smyth] concluded that nine categories of objectionable action were guarded against: chronic toxicity, acute toxicity, narcosis, irritation, asphyxiation, fume fever, eye pigmentation, allergic response, and cancer (Paull 1984/Ex. 1–255).

At about the same time, Stokinger stated that, in his opinion, the Threshold Limits Committee had avoided grappling with the issue of developing a method for establishing limits for industrial carcinogens and noted that, with the exception of nickel carbonyl, limits had not been assigned for potential carcinogens (Paull 1984/Ex. 1–255). In 1962, however, the TLV Committee added three carcinogens to the TLV list, although these were listed separately in an appendix and did not have assigned numerical values.

Despite the fact that the ACGIH had stressed early on that TLVs* were intended as guides and not as rigidly enforceable limits, the American Standards Association's MAC values (or, where none was available, the TLV®) were included as mandatory limits in the Safety and Health Standards for Federal Supply Contracts, which were published in 1960 under the Walsh-Healey Act. Following this action, the ACGIH issued a statement on the definitions and interpretations of TLVs® and MACs (Stokinger 1962/Ex. 1-998). At the same time, the ACGIH announced the production of the first edition of the Documentation for Threshold Limit Values (ACGIH 1962): this was followed by another paper in which the work and intentions of the Threshold Limits Committee were reviewed. Turner states that

[A]t this time the concept of ceiling values and excursion factors around the timeweighted average values was introduced in order to reduce conflict or confusion with the "maximal" values in the American [ANSI] Standards. A "C" (ceiling value) listing was to be given to those fast-acting substances thought likely to be injurious if the concentration exceeded the limit value by more than a designated factor for a relatively short period (about 15 min.). The factor varied between 3 and 1.25, depending inversely upon the magnitude of the TLV. A corollary was that the factor would also indicate the limit of permissive excursion of the concentration above the TLV for a substance not given a "C" listing, always provided that the time-weighted average concentration did not exceed the TLV. This rule of thumb approach to limiting exposure is no doubt appropriate to certain substances

when they are used routinely throughout the working day. It seems to have little relevance in other instances where exposure is irregular or where the basis for fixing the TLV is on grounds other than toxicity (Turner 1976/Ex. 1–79).

Permissible Exposure Limits in the Era of OSHA

Shortly after the Occupational Safety and Health (OSH) Act became effective, OSHA issued standards that would provide the Agency with a basis for promptly commencing its enforcement program. Congress gave OSHA the authority under section 6(a) of the Act to promulgate certain standards without rulemaking, i.e., without the delays inherent in public comment proceedings. These so-called "start-up" standards derived from national consensus standards and established Federal standards, i.e., ANSI, the National Fire Protection Association (NFPA), the Walsh-Healey Public Contracts Act, the Longshoremen's and Harbor Workers' Compensation Act (LHWCA), and the Contract Work Hours and Safety Standards Act of 1969 (also known as the Construction Safety Act).

The startup standards adopted by OSHA for general industry in this early period derived from the ACGIH 1968 list of TLVs® that had been incorporated into the Walsh-Healey Act, and those adopted for construction derived from the 1970 ACGIH TLVs® that had been incorporated into the Construction Safety Act. (There are thus a few differences in the PELs OSHA applies in general industry and construction, since the ACGIH had updated its TLVs® for a few substances when it issued its 1970 list.) In agriculture, however, OSHA did not adopt startup standards and, in the intervening years, the Agency has not, until now, corrected this deficiency (see the discussion in the History and Need for Revision of the PELs section of this preamble). In the interval since the establishment of OSHA and the adoption of the 1970 ACGIH TLVs® and a few ANSI limits for construction and maritime, the ACGIH has continued to revise, update, and document its annual list of TLVs*; since 1968, this process has been an annual one. During this time, the ACGIH TLVs® have been "accepted on an international basis as the best available guides for providing healthful occupational environments, and at least 18 countries, including the United States, have either adopted them as legal standards or as guides to legal action, thus verifying their efficacy in accomplishing this purpose" (Paull 1984/ Ex. 1-255).

In 1989, in the largest rulemaking ever undertaken by the Agency, OSHA updated and supplemented its list of permissible exposure limits by considering new or more protective exposure limits for 428 toxic substances; these new and revised PELs apply in general industry workplaces. The action OSHA takes today initiates the process of extending these new and revised limits to workplaces in the construction, maritime, and agriculture industries. That the limits being proposed for revision and updating are seriously out of date is attested to by the fact that the ACGIH has found it necessary to revise or to add nearly 400 limits to its list of TLVs* in the 20 years since the limits adopted by OSHA in 1971 and still in force in these sectors were initially published. Recognition that OSHA's permissible exposure limits in construction and maritime need updating to reflect recent developments in toxicology and new data on the health effects associated with exposure to these substances is nearly universal and is evidenced by the widespread support for the recent air contaminants rulemaking that updated and revised OSHA's PELs for general industry.

The Agency believes that promulgation of the proposed limits will address a broad range of significant risks now prevalent in the construction, maritime, and agriculture industries. As many industrial hygienists and occupational safety and health professionals have noted, the use of permissible exposure limits continues to be the single most effective way of protecting the health, functional capacity, and well-being of the American worker.

C. Description of the Substances for Which Limits Are Being Proposed

In this rulemaking, OSHA is proposing to revise or to add PELs for approximately 588 toxic substances and to apply these limits to workplaces in the construction, maritime, and agriculture industries. OSHA recently completed this action for general industry (see 54 FR 2332 et seq.). This section of the preamble identifies the PELs being proposed for construction, maritime, and agricultural workplaces, describes the available toxicological data, and explains the Agency's rationale for selecting the permissible exposure limits proposed for these substances.

The universe of substances included in this rulemaking is bounded by the substances that OSHA recently considered in the general industry Air Contaminants rulemaking that amended 29 CFR 1910.1000. That is, OSHA is not at this time proposing exposure limits for any hazardous substance that was

not considered in that rulemaking, with the exception of a group of approximately 160 substances. For these 160 substances, OSHA's current limits in general industry, construction, and maritime are, with very few exceptions. identical and are believed by the Agency already to be at adequately protective levels. However, since OSHA has never had PELs that applied in agricultural workplaces, the Agency is proposing to apply its PELs for these 160 substances, as well as those for the other substances described above, to agriculture for the first time. In addition, OSHA's interpretation is that the exposure limits included in Tables Z-1. Z-2, and Z-3 apply in longshoring. However, the language at 29 CFR 1918.93 (e) and (f) is somewhat ambiguous. Accordingly, OSHA intends in the present rulemaking to eliminate this ambiguity and to make all such limits applicable to the longshoring sector.

For all of the substances addressed in this rulemaking, OSHA has already evaluated in great detail the studies, public comments, and evidence in the prior rulemaking record for general industry. The levels proposed in this rulemaking are the same as those that OSHA determined to be justified in the general industry rulemaking. Therefore, the limits being proposed today represent, in the Agency's professional judgment, those levels found to be most consistent with the best available toxicological data, OSHA's mandate, and the case law that has subsequently developed to interpret that mandate. (For a discussion of the relevant legislative and judicial principles, see the sections of this preamble entitled Pertinent Legal Authority, History and Need for Revision of the PELs, and Approach).

For ease of analysis and presentation, the substances included in the scope of this rulemaking have been grouped into 16 separate sub-sections. In general, these groupings (sections IV.C.1 through IV.C.14) reflect the primary toxicological basis underlying the ACGIH or NIOSH recommended limits for these substances. In addition, two additional sections (Sections IV.C.15 and 16) cover substances for which OSHA is proposing to add short-term limits and those for which the Agency is proposing to add skin notations.

The following sections are included:

Substances for which Proposed Limits
 Are Based on Avoidance of
 Neuropathic Effects

Substances for which Proposed Limits
 Are Based on Avoidance of
 Narcotic Effects

- 3. Substances for which Proposed Limits
 Are Based on Avoidance of Sensory
 Irritation
- 4. Substances for which Proposed Limits Are Based on Avoidance of Liver or Kidney Effects
- 5. Substances for which Proposed Limits Are Based on Avoidance of Ocular Effects
- 6. Substances for which Proposed Limits Are Based on Avoidance of Respiratory Effects
- 7. Substances for which Proposed Limits
 Are Based on Avoidance of
 Cardiovascular Effects
- 8. Substances for which Proposed Limits Are Based on Avoidance of Systemic Toxicity
- 9. Substances for which Proposed Limits Are Based on Observed-No-Adverse-Effect Levels
- Substances for which Proposed Limits Are Based on Avoidance of Physical Irritation and Other Effects
- 11. Substances for which Proposed Limits Are Based on Analogy to Related Substances

- 12. Substances for which Proposed Limits Are Based on Avoidance of Biochemical/Metabolic Effects
- 13. Substances for which Proposed Limits Are Based on Avoidance of Sensitization Effects
- 14. Substances for which Proposed Limits Are Based on Avoidance of Cancer
- Substances for Which 1987–1988
 ACGIH TLV* Are Less Stringent
 Than Existing OSHA PELs
- 16. Substances for Which OSHA Is Proposing Short-Term Exposure Limits
- Substances for Which OSHA Is Proposing to Add Skin Notations.

A list of the references that OSHA is relying on in evaluating the toxicological evidence pertaining to these chemicals appears in section IV-D.

1. Substances for Which Proposed Limits Are Based on Avoidance of Neuropathic Effects

Introduction. Many industrial chemicals have been shown to cause

severe neurological effects in exposed workers, and these effects are often irreversible. The proposed limits for 25 substances have been set at levels established to avoid neuropathic effects in exposed workers. Table C1-1 lists these neuropathic agents, along with their CAS numbers, HS numbers, 1987-1988 ACGIH TLV*s, and NIOSH RELs. In addition, Table C1-1 shows OSHA's current PELs for these substances in construction, shipyards, marine terminals, and longshoring operations. OSHA currently has no PELs for these substances in agriculture. The righthand column in Table C1-1 shows the current PEL for each substance in general industry; these are the limits being proposed today for these substances in construction, maritime, and agricultural workplaces. Promulgation of these limits will make OSHA's PELs for these substances consistent across all regulated sectors.

TABLE C1-1.—SUBSTANCES FOR WHICH PROPOSED LIMITS ARE BASED ON AVOIDANCE OF NEUROPATHIC EFFECTS

H.S. No./chemical name	CAS No.	Current OSHA PEL in construction, shipyards, marine terminals, and longshoring *	1987-1988 ACGIH TLV **	NIOSH REL†	Proposed OSHA PEL in construction, shippards, marine terminals, longshoring, and agriculture*
2019 Biphenyl (Diphenyl)	92-52-4	0.2 ppm TWA	0.2 ppm TWA		0.2 ppm TWA.
1051 n-Butyl alcohol	71-36-3	100 ppm TWA	50 ppm Ceiling, Skin		50 ppm Ceiling, Skin.
1078 Chlorinated camphene	8001-35-2	0.5 mg/m³ TWA, Skin.	0.5 mg/m³ TWA, 1 mg/m³ STEL, Skin.		0.5 mg/m³ TWA, 1 mg/m³ STEL, Skin.
1114 Decaborane	17702-41-9	0.05 ppm TWA, Skin.	0.05 ppm TWA, 0.15 ppm STEL, Skin.		0.05 ppm TWA, 0.15 ppm STEL, Skin.
2054 Diborane	19287-45-7	0.1 ppm TWA	0.1 ppm TWA		0.1 ppm TWA
1116 Di-sec-octyl-phthalate (Di- ethylhexyl-phthalate).	117-81-7	5 mg/m³ TWA	5 mg/m³ TWA, 10 mg/m³ STEL	(††)	5 mg/m³ TWA, 10 mg/m³ STEL.
1123 Dichloroacetylene	7572-29-4	0.1 ppm Ceiling	0.1 ppm Ceiling		0.1 ppm Ceiling.
1149 Dipropylene glycol methyl ether.	34590-94-8	100 ppm TWA, Skin.	100 ppm TWA, 150 ppm STEL, Skin.		
1200 n-Hexane	110-54-3	500 ppm TWA	50 ppm TWA	100 ppm TWA, 510 ppm, (15- min) Ceiling.	50 ppm TWA.
1202 2-Hexanone (Methyl n-butyl ketone).	591-78-6	100 ppm TWA	5 ppm TWA		5 ppm TWA.
1216 Iron pentacarbonyl (as Fe)	13463-40-6		0.1 ppm TWA, 0.2 ppm STEL		0.1 ppm TWA, 0.2 ppm STEL
2100 Lindane	58-89-9	0.5 mg/m³ TWA, Skin.	0.5 mg/m³ TWA, Skin		0.5 mg/m³ TWA, Skin.
2103 Manganese, dust and com- pounds.	7439-96-5	5 mg/m³ Ceiling	5 mg/m³ Ceiling		5 mg/m³ Ceiling.
1236A Manganese, fume (as Mn)	7439-96-5	5 mg/m³ Ceiling	1 mg/m3 TWA, 3 mg/m3 STEL		1 mg/m3 TWA, 3 mg/m3 STEL
1237 Manganese cyclopenta- dienyl tricarbonyl (as Mn).	12079-65-1		0.1 mg/m³ TWA, Skin		0.1 mg/m³ TWA, Skin.
1238 Manganese tetroxide (as Mn).	1317-35-7		1 mg/m³ TWA		1 mg/m³ TWA.
1240 Mercury (aryl and inorganic compounds) (as Hg).	7439-97-6	0.1 mg/m³ TWA, Skin.	0.1 mg/m³ TWA, Skin³	0.05 mg/m³ TWA	0.1 mg/m³ Ceiling, Skin.
1241 Mercury, vapor (as Hg)	7439-97-8	0.1 mg/mª TWA, Skin.	0.05 mg/m² TWA, Skin	0.05 mg/m³ TWA	0.05 mg/m ^s TWA, Skin.
1242 Mercury, (organo) alkyl compounds (as Hg).	7439-97-6	0.01 mg/m³ TWA, Skin.	0.01 mg/m³ TWA, 0.03 mg/m³ STEL, Skin.		0.01 mg/m ⁸ TWA, 0.03 mg/m ⁸ STEL, Skin.
2104 Methyl acetylene	74-99-7	1000 ppm TWA	1000 ppm TWA, 1250 ppm STEL		
1251 Methylacrylonitrile	126-98-7		1 ppm TWA, Skin		1 ppm TWA, Skin.
1253 Methyl bromide	74-83-9	20 ppm Ceiling, skin.	5 ppm TWA, Skin	(††)	5 ppm TWA, Skin.
1304 Pentaborane	19624-22-7	0.005 ppm TWA	0.005 ppm TWA, 0.015 ppm STEL.		0.005 ppm TWA, 0.015 ppm STEL.
1316 Phenyl mercaptan	108-98-5		0.5 ppm TWA		

TABLE C1-1.—SUBSTANCES FOR WHICH PROPOSED LIMITS ARE BASED ON AVOIDANCE OF NEUROPATHIC EFFECTS—Continued

H.S. No./chemical name CAS No		Current OSHA PEL in construction, shipyards, marine terminals, and longshoring *	1987-1988 ACGIH TLV **	NIOSH REL†	Proposed OSHA PEL in construction, shipyards, marine terminals, longshoring, and agriculture*	
1342 1,2-Propylene glycol dini- trate.	6423-43-4		0.05 ppm TWA, Skin		0.05 ppm TWA.	

* OSHA's TWA limits are for 8-hour exposures; its STELs are for 15 minutes unless otherwise specified; and its ceilings are peaks not to be exceeded for any period of time; OSHA's PELs do not currently apply in Agriculture.

** The ACGIH TLV%—TWA is for an 8-hour exposure; its STELs are 15-minute limits not to be exceeded more than 4 times per day with a minimum of 60 minutes

between successive STEL exposures; and its ceilings are peaks not to be exceeded for any period of time.

† NIOSH TWA limits are for 10 hour/day, 40 hour/week exposures unless otherwise specified, and its ceilings are peaks not to be exceeded for any period of time

unless a duration is specified in parentheses

t NIOSH considers this substance a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration.

The OSHA limit for the aryl and inorganic compounds of mercury derived from an American National Standards Institute (ANSI) standard rather than the ACGIH

Description of the health effects. The human nervous system comprises the central nervous system (CNS) and the peripheral nervous system (PNS). The CNS is made up of the brain and spinal cord, while the PNS consists of a network throughout the body of nerves that communicate with the CNS via connections to the spinal cord. The brain and spinal cord are bathed in cerebrospinal fluid, which supplies nutrients to the CNS and also acts as a barrier against the entry of some foreign substances. This barrier protects the central nervous system. In general, fatsoluble substances readily diffuse across this barrier and water-soluble substances do not.

Chemicals that affect the central nervous system can manifest their toxic effects peripherally. An example of this is the tremor associated with elemental and organic mercury poisoning. Exposure to some neurotoxic chemicals (for example, to n-hexane) is associated with axonal degeneration of the nerves in both the central and peripheral nervous systems. Baker (1983/Ex. 1-230) refers to this dual-system effect as central-peripheral distal axonopathy.

Nervous system toxicants can affect motor function, sensory function, or integrative processes, and they can also cause changes in the behavior of exposed persons. Substances that cause demyelination or neuronal damage can produce motor dysfunction that is expressed as muscular weakness or unsteadiness of gait, while exposures to chemicals that are associated with loss of sensory function may result in alterations in touch, pain, or temperature sensation or damage to sight or hearing. Other neuropathic chemicals affect the way in which information is processed in the brain and can interfere with learning and memory. OSHA believes that all of the health effects described above

constitute material impairments of health within the meaning of the Act.

Although mature neurons cannot divide and be replaced, the nervous system has considerable ability to restore function that is lost as a result of exposure to toxic chemicals. This capability to restore function even after neurons have been killed is achieved by two mechanisms: Plasticity of organization and redundancy of function; that is, when some neurons die, other cells that perform the same function may be able to maintain an adequate level of functioning, or other neurons may be able to "learn" how to perform the lost function. However, even when one of these mechanisms comes into play to compensate for neuronal damage, the overall reserve capacity of the nervous system will have been diminished. The loss of this reserve could be critical in a situation in which additional demands are placed on the nervous system. Thus, even so-called reversible neuropathic effects should be seen as toxic effects causing alterations in and material impairment of the normal functioning of the nervous

The neurological effects potentially associated with chemical exposures are numerous, and it is not always easy to identify the precise target site. However, recent medical advances have made tests available that can detect neurological damage that was not detectable several years ago. For example, electrophysiological methods have been developed to measure damage to the visual pathway caused by such exposures. Because of the variation in individual responses to chemical exposures, exposure limits should be set with a view toward this range of susceptibility and the avoidance of any neuropathic effects.

Peripheral nervous system effects. The pathological mechanisms associated with peripheral neuropathies result from segmental demyelination or axonal degeneration. Segmental demyelination destroys the myelin sheath but leaves the axon intact; this causes a slowing in nerve conduction velocity. Muscle weakness is often the first sign of such segmental demyelination, and this effect can progress to loss of motor function or paralysis. Although remyelination may occur within weeks after injury, even a temporary loss in motor or sensory function may place the affected worker (and his or her co-workers) at risk of injury.

Axonal degeneration is a more serious effect because recovery is often slow or incomplete. This type of degeneration causes demyelination secondary to the degeneration of the distal portion of the nerve. This effect occurs when a chemical interferes with the physiologic dynamics of the nerve, e.g., when it decreases the transport of nutrients to the nerve: in such cases, the axon degenerates (dies back) sufficiently to accommodate the cell's capacity to supply it with nutrients. Axonal degeneration can also occur as a result of biochemical or metabolic derangement of the central nervous system. Alkyl mercury and elemental mercury are examples of neurotoxic chemicals causing this type of effect (Cavanaugh 1977/Ex. 1-202).

Central nervous system effects. The mechanism of action of central nervous system toxins is not well understood but is believed to be associated with neurochemical alteration in the brain. Seizures, Parkinsonism, intellectual impairment, narcosis, dementia, cranial neuropathy, and visual disturbances are all examples of effects that can occur after overexposures to neuropathic chemicals. The more serious CNS effects, such as Parkinsonism, dementia, intellectual impairment, and cranial neuropathy, are generally not reversible (Baker 1983/Ex. 1-230). Before these

exposure-related effects are manifested, subtle changes in behavior may occur; if these subtle signs are interpreted correctly, exposure can be stopped before irreversible damage occurs.

Dose-response relationships and neuropathic effects. The development of chemically induced neurological effects is believed to follow a dose-response pattern. At an exposure intensity or duration below the no-effect level, detectable effects are unlikely to be evident. As exposure intensity/duration increases to and beyond this level, the toxin begins to interfere with the normal cellular processes of the neurological system. At this early stage, transient signs and symptoms may appear. Overt effects become more severe as exposure continues and finally progress to serious loss of neurological function and possible permanent damage to neural tissue. Increases in our ability to detect neurological changes at lower levels of exposure have shown that neurobehavioral changes or impairment may occur at levels previously thought to be innocuous. These early effects can be important indicators of potential functional impairment at exposure levels below those that produce either transient or permanent damage. Heavy metals, solvents, and pesticides are examples of substances that can cause symptoms and conditions such as nausea, sensory and motor function impairments, depression, sleep disturbances, cognitive impairment, and sexual dysfunction. The limits being proposed for the substances in this group of neurotoxins are designed to maintain worker exposures below the level associated with such adverse health effects. OSHA believes that this approach will ensure that employees will not be likely to suffer these material impairments of health and will provide a margin of safety against the risk of more severe or permanent neurological impairment.

The following discussions describe OSHA's preliminary findings for all of the substances in this group and illustrate the material impairments of health potentially faced by workers exposed to these toxicants. BIPHENYL (DIPHENYL) CAS: 92-52-4; Chemical Formula:

C6H5C6H5 H.S. No. 2019

In general industry, construction, and maritime, OSHA's current permissible exposure limit for biphenyl (also called biphenyl) is 0.2 ppm as an 8-hour TWA. There is no current limit for this substance in agriculture. The ACGIH has a TLV*-TWA of 0.2 ppm for biphenyl VIOSH has no REL but

concurs with the PEL being proposed. OSHA is proposing an 8-hour TWA PEL in agriculture of 0.2 ppm for biphenyl. This is the limit recently established for this substance in general industry.

Biphenyl is a solid substance that is crystalline in form and ranges in color from colorless to light yellow (Hawley's 1987, p. 426; AIHA 1964). Biphenyl has a distinct aromatic odor and occurs most commonly in the form of a white, scaly solid (ACGIH 1986, p. 58; AIHA 1964). Biphenyl is used as a fungistat in the packaging of citrus fruits, for plant disease control, in organic synthesis, as a heat-transfer agent, and as a dveing assistant for polyesters (Hawley's 1987, p. 426; ACGIH 1986, p. 58). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide

Act (FIFRA).

Biphenyl is an irritant of the eyes and mucous membranes in both animals and humans; at high concentrations, this substance causes peripheral and central nervous system damage, liver and kidney damage, and bronchopulmonary lesions. The oral LD50 in the rat is 3280 mg/kg (RTECS 1991). Rats who have inhaled diatomaceous earth impregnated with biphenyl at a 300-mg/ m3 concentration for 7 hours/day for 64 days showed signs of irritation of the nasal mucosa and labored breathing; bronchopulmonary lesions and mild toxic effects on the liver and kidneys were seen at autopsy. Rabbits were unaffected by this exposure, but mice exposed at only 5 mg/m3 for this period of time showed signs of respiratory difficulty (Deichmann, Kitzmiller, Dievker et al. 1947). Among 33 workers in one plant who had had prolonged exposure to biphenyl at concentrations as high as 123 mg/m3, the most commonly described symptoms were headache, numbness and aching of the limbs, general fatigue, and gastrointestinal symptoms (pain, nausea, and indigestion). Examinations of 22 of these workers for neurophysiological changes found that 19 had alterations representative of central and/or peripheral nervous system damage. In one fatal case in this plant, exposure was estimated to have been high (not further specified) for 11 years. Autopsy showed widespread liver necrosis with some cirrhotic areas, nephrotic changes, heart muscle degeneration, and edematous brain tissue (Hakkinen, Hernberg, Karli, and Vikkula 1973).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant

risk of experiencing the material health impairments potentially associated with exposure to biphenyl; these include central and peripheral nervous system injury, irritation of the eyes and mucous membranes, bronchopulmonary lesions, and liver and kidney damage. The Agency believes that establishing an 8hour TWA PEL of 0.2 ppm will substantially reduce these significant occupational risks in agricultural establishments. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

n-BUTYL ALCOHOL CAS: 71-36-3; Chemical Formula: CH2CH2CH2CH2OH H.S. No. 1051

In construction, shipyards, marine terminals, and longshoring operations, OSHA's current PEL for n-butyl alcohol is a 100-ppm 8-hour TWA; the ACGIH TLV* is a 50-ppm ceiling, with a skin notation. OSHA has no PEL for this substance in agriculture. NIOSH has no REL for n-butyl alcohol but concurs (Ex. 8-47, Table N1) that the 50-ppm ceiling PEL and skin notation OSHA is proposing for this substance in construction, maritime, and agriculture are appropriate. These were the limits recently established for n-butyl alcohol in general industry.

n-Butyl alcohol is a colorless, highly refractive liquid with a mild wine-like odor. n-Butyl alcohol is widely used as a solvent in shellacs, varnishes, resins, waxes, oils, dyes, and surface coatings, and as a chemical intermediate. It is also used in veterinary medicine as a bactericide (HSDB 1985). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

n-Butyl alcohol is a moderate irritant of the eyes, nose, and throat in humans and animals and has caused hearing loss in experimental animals and exposed workers. The oral LD50 in rats is 790 mg/kg, and the LCso in the same species is 8000 ppm for 4 hours (RTECS 1990). The dermal LDso in rabbits is 3400 mg/kg (RTECS 1990). In contact with rabbit eyes, n-butyl alcohol causes moderate but reversible injury (graded 7 on an ascending severity scale of 1 to 10) (Grant 1986, p. 162). Applied to the skin of rabbits, n-butyl alcohol caused mild-to-moderate irritation (RTECS

In humans, however, n-butyl alcohol is suspected of causing vacuolar keratopathy, i.e., many transparent vacuoles in the epithelial layers of the

cornea (Cogan and Grant 1945, 1948; Jaeger 1953; Kruger 1932). Exposure to butyl alcohol-containing solvents is believed to have caused this effect. which can, in severe cases, result in lacrimation and pain, especially on first arising in the morning (Cogan and Grant 1945). Contact dermatitis of the hands and fingers of exposed workers has also been reported (Clayton and Clayton 1981, p. 4577). Systemic effects in the form of vestibular and auditory nerve injuries have occurred in n-butylalcohol-exposed workers in France and Mexico (Seitz 1972; Velasquez 1964; Velasquez, Escobar, and Almaraz 1969/ Ex. 1-1174). Based on data describing the rate of n-butyl alcohol uptake through the skin of dogs. DiVincenzo and Hamilton (1979) suggested that direct contact of unprotected human hands with liquid n-butyl alcohol for one hour would result in an absorbed dose that is four times that resulting from the inhalation of 50 ppm for one hour.

The current OSHA 8-hour TWA limit of 100 ppm in construction and maritime is based on the studies of Tabershaw, Fahy, and Skinner (1944) and of Smyth (1956/Ex. 1-759). These studies indicated that workers experienced no narcotic or systemic effects at n-butyl alcohol concentrations below 100 ppm. However, eye, nose, and upper respiratory tract irritation did occur in humans exposed to 24 ppm; this irritation became uncomfortable and was followed by headaches when the concentration reached 50 ppm (Nelson, Enge, Ross et al. 1943/Ex. 1-66; RTECS

1990)

Other data reported by Seitz [1972], Velasquez (1964), and Velasquez, Escobar, and Almaraz (1969/Ex. 1-1174) indicate serious exposure-related hearing loss (hypoacusia) and long-term. systemic effects on the auditory nerves of exposed workers; the magnitude of the hearing loss was related to length of exposure to n-butyl alcohol. Nine of 11 workers exposed without hearing protection to an n-butyl alcohol concentration of 80 ppm for periods of from 3 to 11 years displayed impaired hearing, and this phenomenon was particularly evident in younger workers (Velasquez 1964; Velasquez, Escobar, and Almaraz 1969/Ex. 1-1174).

A commenter in the prior Air Contaminants rulemaking (Tr. p. 3–237) questioned whether n-butyl alcohol affects the hearing of exposed individuals. In response to this comment, OSHA noted many studies have shown a relationship between exposure to n-butyl alcohol and demage the auditory nerve (54 FR 2408).

Based on this evidence, OSHA preliminarily finds that the current 8-

hour TWA PEL of 100 ppm is not sufficiently protective against the acute effects associated with exposure to nbutyl alcohol; in addition, the possibility that auditory nerve damage may be caused by exposure to concentrations of this substance below the 100-ppm level clearly suggests that the current PEL is inadequate. A skin notation is necessary because data in animals (DiVincenzo and Hamilton 1979) suggest that percutaneous absorption may contribute more to overall exposure than inhalation. OSHA is therefore proposing to establish a permissible exposure limit of 50 ppm as a ceiling, with a skin notation, for n-butyl alcohol. OSHA preliminarily concludes that this limit will protect workers in construction, maritime, and agriculture against the significant risks of potential vestibular and auditory nerve injury as well as of headaches, irritation, and dermatitis, which constitute material impairments of health and are associated with exposure to this substance in the workplace. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

CHLORINATED CAMPHENE (60 Percent)

CAS: 8001-35-2; Chemical Formula: C₁₀H₁₀C₁₈

H.S. No. 1078

In construction, shipyards, marine terminals, and longshoring operations, OSHA currently has an 8-hour TWA limit of 0.5 mg/m3, with a skin notation, for chlorinated camphene. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA limit of 0.5 mg/m3 and a TLV*-STEL of 1 mg/m3 for chlorinated camphene (60 percent), with a skin notation; NIOSH has no REL for this substance. OSHA is proposing to add a 1-mg/m3 STEL to the 0.5-mg/m3 8-hour TWA PEL for chlorinated camphene in construction and maritime, to retain the skin notation, and to extend these limits and the skin notation to workplaces in agriculture.

Chlorinated camphene (also called toxaphene) is a waxy amber solid with a pleasant, pine-like odor. This substance was formerly used as an insecticide on cotton and food crops and in agriculture as a sheep and cattle dip against scabies (HSDB 1987). In 1982, all major uses of this substance were banned by the EPA, and current use is consequently believed

to be very low (EPA 1987).

Chlorinated camphene is a convulsant, a liver and kidney toxin, and a carcinogen in experimental animals (EPA 1987). The oral LD₅₀ in rats is 55 mg/kg, and the dermal LD₅₀ in

rabbits is 1025 mg/kg (RTECS 1990). Before death, acutely poisoned animals show varied central nervous system effects, including nausea, muscle spasms, confusion, and convulsions (Hayes 1963/Ex. 1-982). Monkeys tolerate daily feeding at 10 ppm but show toxic symptoms after two weeks' feeding at the 60-ppm level (Sosnierz, Szczurek, Knapek, and Kolodziejczyk 1972/Ex. 1-760). Dogs chronically exposed to this substance by gavage convulsed and subsequently died of respiratory failure. At autopsy, kidney damage was seen (EPA 1987). Rats exposed to chlorinated camphene in lifetime feeding studies showed increases in liver weight and, at autopsy, fatty degeneration and/or necrosis of the liver (EPA 1987). In mice fed average doses of 98 or 198 ppm chlorinated camphene in the diet for 80 weeks, there was a dose-related and statistically significant increase in hepatocellular carcinomas (IARC 1979, Vol. 20, p. 339; EPA 1987). In rats fed average doses of 556 or 1112 ppm (males) or 540 or 1080 ppm (females) for 80 weeks, there was a statistically significant increase in thyroid follicular cell adenomas and carcinomas in the high-dose group in both sexes (EPA 1987; IARC 1979, Vol. 20, pp. 335-336). Based on this evidence, both NIOSH (Ex. 8-47, Table N6B) and the International Agency for Research on Cancer (IARC) have concluded that chlorinated camphene is a potential human carcinogen (IARC 1979, Vol. 20, p. 339). (As discussed earlier in this preamble, OSHA has placed this substance into the neurotoxin category based on the ACGIH's rationale for the TLV* for this substance; placement in a category does not mean that a substance does not also have other health effects.)

In humans, the acute lethal dose of chlorinated camphene by ingestion has been estimated at 60 mg/kg (EPA 1987). and a dose of 10 mg/kg has caused nonfatal convulsions in some exposed individuals. The ACGIH (1986/Ex. 1-3, p. 115) concludes that the acute toxicity of chlorinated camphene is equivalent to that of chlordane, for which the fatal human dose is estimated to be around 6 grams; the ACGIH TLV®-TWA for chlordane is 0.5 mg/m³. One study of 25 human volunteers failed to reveal toxic responses to daily 30-minute exposures to a 500 mg/m3 concentration of chlorinated camphene for 10 consecutive days, followed by similar exposures for three consecutive days three weeks later (ACGIH 1986, Ex. 1-3, p. 115). Two cases of acute aplastic anemia have been reported in workers dermally exposed to chlorinated camphene and lindane, and

one of these workers subsequently died (EPA 1987, p. 4).

OSHA is proposing to add a 15-minute STEL of 1.0 mg/m3 to the current 8-hour TWA PEL of 0.5 mg/m3 and the existing skin notation for chlorinated camphene. and to extend these limits to agriculture. OSHA preliminarily concludes that both a TWA limit and a STEL are required to protect exposed workers in construction, maritime, and agriculture against the significant risks of convulsions and other systemic effects associated with exposure to this substance. OSHA believes that these adverse health effects constitute material impairments of health and that the proposed TWA PEL and STEL will ensure that worker exposures are maintained under good industrial hygiene control. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors. DECABORANE

CAS: 17702–41–9; Chemical Formula: $B_{10}H_{14}$

H.S. No. 1114

In construction and maritime, OSHA's current limit for decaborane is 0.05 ppm as an 8-hour TWA, with a skin notation. There is no PEL in agriculture. The ACGIH has a TLV*-TWA of 0.05 ppm and a TLV*-STEL of 0.15 ppm, also with a skin notation. NIOSH has no REL for decaborane but concurs (Ex. 8-47, Table N1) that the limits OSHA is proposing are appropriate. OSHA is proposing to add a 15-minute STEL of 0.15 ppm to the 8-hour TWA PEL of 0.05 ppm for decaborane, and to retain the skin notation, in the construction and maritime industries and to extend these limits to agriculture. These are the limits recently established for decaborane in general industry.

Decaborane forms colorless crystals that are stable at ordinary temperatures; this substance has a pungent odor. Decaborane is used as a rocket propellant and as a catalyst in olefin polymerization. It is also used to coat metals to impart corrosion resistance, in mothproofing and dye-stripping, and as

a reducing and fluxing agent.

The acute toxicity of decaborane is extremely high for laboratory animals. The 4-hour LC₅₀s for rats and mice are 46 and 12 ppm, respectively (Schechter 1958/Ex. 1–963). Both acute and chronic exposure of several species of laboratory animals has consistently resulted in neurologic signs, including restlessness, depressed breathing, incoordination, weakness, and convulsions (Roush 1959). The ability of decaborane to penetrate the skin is particularly notable: the dermal LD₅₀s for rabbits and rats are 71 and 740 mg/

kg, respectively (Svirbely 1954a/Ex. 1-385).

Neurotoxic signs and symptoms occurring among exposed humans have also been reported; these have included headache, lethargy, nausea, dizziness, convulsions, and muscle tremors (Lowe and Freeman 1957). Decaborane also produces marked irritation of the skin and mucous membranes; contact with the eyes can result in serious keratoconjunctivitis, with ulceration and necrotic changes (HSDB 1985).

OSHA is retaining its 8-hour TWA PEL of 0.05 ppm and the skin notation for decaborane in construction and maritime, and is proposing to add a 15minute STEL of 0.15 ppm for this substance in these two sectors; OSHA also is proposing to extend the 8-hour TWA, the 15-minute STEL, and the skin notation to agriculture. The Agency preliminarily concludes that these limits will provide protection against the significant risks of material health impairment in the form of neuropathy and irritation. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

DIBORANE

CAS: 19287-45-7; Chemical Formula: B₂H₆

H.S. No. 2054

In general industry, construction, and maritime, OSHA's current permissible exposure limit for diborane is 0.1 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*—TWA of 0.1 ppm for this substance.

NIOSH has no REL but concurs (Ex. 8—47, Table N3A) with the limit being proposed. OSHA is proposing to establish an 8-hour TWA PEL of 0.1 ppm for diborane in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all OSHA-regulated sectors.

Diborane is a colorless, flammable gas with a repulsive, sweet odor. Diborane is used in the synthesis of boron compounds and metal borohydrides, as a polymerization catalyst for ethylene, as a fuel for engines and rockets, as a reducing agent, and as a doping agent (NIOSH/OSHA Occupational Health Guideline 1981, p. 1; Hawley's 1987, p.

Diborane causes pulmonary irritation and may also affect the nervous system in humans and animals. In rats and mice, LC₆₀ values are 40 ppm and 29 ppm for 4 hours, respectively (RTECS 1990). The lowest lethal concentration in hamsters is 50 ppm for 8 hours; in dogs, this value is 125 ppm for 2 hours (RTECS 1990). Acutely poisoned animals died of pulmonary edema (Merritt 1965). Dogs

repeatedly exposed to 5 ppm diborane for 6 hours/day died after 10 to 20 such exposures, but one of two dogs survived repeated exposures to concentrations of 1 to 2 ppm for 6 months (Comstock et al. 1954). Repeated exposure to an unspecified concentration of diborane caused spinal cord lesions in a dog (Jacobson, Murtha, Weir et al. 1960).

The inhalation dose that is lethal to humans is 159 ppm for 15 minutes (Braker and Mossman 1980, p. 219). Acute diborane poisoning via inhalation causes signs and symptoms similar to those of metal fume fever, including tightness, heaviness, and burning in the chest, coughing, shortness of breath, pericardial pain, nausea, and drowsiness. These symptoms may not onset for 24 hours after exposure and may persist for 1 to 3 days or more (Parmeggiani 1983, p. 318). Exposure to high concentrations (not further specified) of diborane causes eye irritation (Proctor, Hughes, and Fischman 1988, p. 181). Prolonged exposure to low levels of diborane causes headache, lightheadedness, vertigo, chills, and fever; fatigue or weakness may also occur and persist for several hours (Cordasco, Cooper, Murphy, and Anderson 1962; Lowe and Freeman 1957). Recurrent diborane exposure caused chronic respiratory distress in two patients (Cordasco et al.

Based on this evidence in humans and animals, OSHA preliminarily concludes that exposure to diborane causes eye irritation, respiratory injury, and central nervous system effects. The Agency believes that, in the absence of a limit, workers in agriculture are at significant risk of experiencing these adverse exposure-related effects. OSHA believes that establishing an 8-hour TWA PEL of 0.1 ppm for diborane in agriculture is necessary to substantially reduce the risks of these material health impairments. In addition, promulgation of this limit for diborane will make OSHA's PEL for this substance consistent across all OSHA-regulated sectors.

Di-sec-OCTYL PHTHALATE CAS: 117-81-7; Chemical Formula: C₂₄H₃₈O₄ H.S. No. 1116

OSHA's current limit for di-sec-octyl phthalate in the construction and maritime industries is 5 mg/m³ as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 5 mg/m³ and a TLV*-STEL of 10 mg/m³, and these are the limits OSHA is proposing for the construction, agriculture, and maritime industries.

NIOSH (Ex. 8-47, Table N6A) concurred with these limits.

Di-sec-octyl phthalate, also called di-2-ethylhexyl phthalate or DEHP, is a light-colored, viscous, odorless, combustible liquid that is used as a plasticizer for resins and elastomers (ACGIH 1986, p. 86/Ex. 1–3, p. 223). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

DEHP is not acutely toxic to small laboratory animals via the oral route of administration. The oral LD50 reported for mice is 26.3 g/kg; for rats, it is 33.8 g/ kg (Krauskopf et al. 1973/Ex. 1-495). No skin irritation or sensitization potential has been demonstrated in either animals or humans, and the lethal dermal dose in rabbits is about 25 ml/kg (Singh, Lawrence, and Autian 1972/Ex. 1-436). Shaffer, Carpenter, and Smyth (1945/Ex. 1-369) and Lawrence (unpublished data, as cited in ACGIH 1986/Ex. 1-3, p. 223) have reported deaths in rats and chronic diffuse inflammation of the lung in mice exposed to DEHP at unspecified levels.

Long-term dietary toxicity studies in rats, guinea pigs, and dogs have established a no-effect dose level for DEHP of about 60 mg/kg/day, and no carcinogenic or histologic abnormalities were observed at this level (Gesler 1973/Ex. 1–481). Higher doses were associated with growth retardation and increased liver and kidney weights but not with histologic abnormalities. Metabolic studies have demonstrated that laboratory animals do not appreciably metabolize DEHP (Dillingham and Autian 1973/Ex. 1–477).

Di-sec-octyl phthalate has been shown to be carcinogenic to rats and mice fed higher doses; this evidence comes from a National Toxicology Program bioassay in which male and female Fischer 344 rats were fed 0, 6, or 12 g DEHP per kg diet and B6C3F1 mice were fed 0, 3, or 6 g DEHP per kg diet for 103 weeks (IARC 1982, Vol. 29, p. 269, corr. 42:261). There was a statistically significant and dose-related increase in the incidence of hepatocellular carcinomas in both sexes of both species of animals tested. Based on this evidence, IARC (1982) concluded that there was sufficient evidence of DEHP's carcinogenicity in animals, and NIOSH (Ex. 8-47, Table N6A) concurs with this assessment.

Several animal studies have reported fetotoxic, teratogenic, and reproductive effects associated with exposure to disec-octyl phthalate. Fetal resorptions, fetal deaths, and gross abnormalities were reported following treatment of pregnant rats with 5 or 10 g/kg DEHP by

intraperitoneal injection on days 5, 10, and 15 of gestation (IARC, 1982, Vol. 29, p. 269). Administration of 0.05 to 1 percent DEHP in the diet of mice throughout gestation resulted in an increased frequency of fetal resorptions and fetal malformations, including neural tube defects and delayed ossification (Shiota and Nishimura 1982). Doses of 2 or 4 ml/kg administered intraperitoneally to pregnant rats on days 3, 6, and 9 of gestation prevented implantation and caused excessive bleeding, incomplete expulsion of fetuses, and maternal deaths (Peters and Cook 1973).

A study of workers exposed to a mixture of the vapors of diethyl phthalate, dibutyl phthalate, and di-2ethylhexyl phthalate reported that exposures to 1 to 6 ppm caused no peripheral polyneuritis (Raleigh, as cited in ACGIH 1986/Ex. 1-3, p. 223). However, Russian investigators examined male and female workers exposed to between 1.7 and 66 mg/m3 of various combinations of airborne phthalates (including butyl phthalate, higher aryl phthalates, dioctyl phthalate and others) and noted complaints of pain, numbness, and spasms in the upper and lower extremities after six to seven years of exposure. Polyneuritis was observed in 32 percent of the workers studied, and 78 percent of these workers showed depression of vestibular receptors (Milkov, Aldyreva, Popova et al. 1973/Ex. 1-646).

OSHA is retaining the 8-hour TWA PEL of 5 mg/m3 in construction and maritime, proposing to add a 15-minute STEL of 10 mg/m3 for di-sec-octyl phthalate in these two industries, and proposing to extend both limits to the agricultural sector. The Agency preliminarily concludes that these limits together will protect workers from the significant risks of neuropathic and other systemic injuries that constitute material health impairments that are associated with exposure to this substance. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

DICHLOROACETYLENE

CAS: 7572–29-4; Chemical Formula:

ClC≡CCl H.S. No. 1123

OSHA currently has no limit for dichloroacetylene in the agriculture, construction, or maritime industries. The ACGIH has a TLV*-ceiling of 0.1 ppm. NIOSH has no REL but concurs (Ex. 8–47, Table N6A) with the limit being proposed. OSHA is proposing a ceiling limit of 0.1 ppm for dichloroacetylene in construction, maritime, and agriculture.

This is the limit recently established for dichloroacetylene in general industry.

Dichloroacetylene is not produced commercially but is formed from the thermal decomposition of trichloroethylene. This substance is a spontaneously combustible liquid.

In preliminary inhalation exposure studies, guinea pigs demonstrated a 4hour LC50 of 20 ppm; death occurred in these animals 2 or 3 days after exposure and was caused by pulmonary edema. In rats, similar exposures to dichloroacetylene in the presence of a 330-ppm concentration of trichloroethylene resulted in an LC50 of 55 ppm (Siegel, Jones, Coon, and Lyon 1967). The LC50s for 1- and 4-hour exposures in mice were 124 and 19 ppm, respectively; deaths were caused by kidney injury and, at autopsy, degenerative lesions were found in the brain (Reichert, Ewald, and Henschler 1975). Rats exposed for 6 hours/day, 5 days/week, for 6 weeks to a dichloroacetylene-trichloroethylene mixture exhibited weakness in the hind limbs, respiratory distress, self-inflicted bite wounds, and kidney injury; the concentrations of dichloroacetylene employed in this study were 2, 9, 9.8, and 15.5 ppm (Reichert, Henschler, and Bannasch 1978).

In humans, dichloroacetylene exposure causes headache, loss of appetite, extreme nausea, and vomiting; exposure affects the trigeminal nerve and facial muscles and exacerbates facial herpes. Disabling nausea was experienced by approximately 85 percent of individuals exposed for prolonged periods of time (not further specified) at concentrations ranging from 0.5 to 1 ppm (Saunders 1967/Ex. 1-361). Several occupational fatalities have been attributed to exposure to dichloroacetylene (Humphrey and McClelland 1944/Ex. 1-491; Firth and Stuckey 1945, as cited in ACGIH 1986/ Ex. 1-3, p. 177). Humphrey and McClelland (1944/Ex. 1-491) reported 13 cases of cranial nerve palsy, nine of which had labial herpes, following exposure to dichloroacetylene. These patients also had symptoms of nausea. headache, jaw pain, and vomiting. Autopsies of two of these victims revealed edema at the base of the brain (Humphrey and McClelland 1944/Ex. 1-

In the prior air contaminants rulemaking, NIOSH indicated that, in its opinion, this substance should be designated as a potential occupational carcinogen (Ex. 8-47, Table N6A) based on findings of an increased incidence of kidney adenocarcinomas in male mice and an increased incidence of

lymphomas and benign liver and kidney tumors in rats administered dichloroacetylene by inhalation. The International Agency for Research on Cancer has concluded that there is limited evidence for the carcinogenicity of dichloroacetylene in animals (IARC 1986, Vol. 39, pp. 369-378). As discussed elsewhere in this preamble, OSHA notes that placement of this substance in the neurotoxin category for the purposes of this rulemaking in no way obviates these findings of dichloroacetylene's carcinogenicity in animals; placement in this category is intended for ease of classification only and simply reflects the rationale underlying the ACGIH limit for this substance.

Based on the neurotoxic effects described above, OSHA is proposing a ceiling limit of 0.1 ppm for dichloroacetylene in the agriculture, construction, and maritime industries. The Agency preliminarily concludes that this limit will substantially reduce the significant risks of disabling nausea and serious systemic effects posed to workers exposed to dichloroacetylene in these sectors at the levels currently permitted by the absence of an OSHA limit. OSHA finds that these health effects constitute material impairments of health. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

DIPROPYLENE GLYCOL METHYL ETHER

CAS: 34590-94-8; Chemical Formula: CH₃OC₆H₆OC₆H₆OH H.S. No. 1149

For the construction and maritime industries, OSHA currently has an 8hour TWA limit of 100 ppm for dipropylene glycol methyl ether (DPGME), with a skin notation. The ACGIH recommends a TLV*-TWA of 100 ppm and a TLV*-STEL of 150 ppm, with a skin notation. In construction and maritime, OSHA is retaining the 8-hour TWA permissible exposure limit of 100 ppm and the skin notation and is proposing to add a 150-ppm STEL for dipropylene glycol methyl ether; the Agency is also proposing to extend these limits to agriculture. NIOSH has no REL but concurred (Ex. 8-47, Table N1) that these limits are appropriate. These are the limits recently established in general industry.

DPGME is a colorless liquid with a mild, pleasant odor. It is used as a solvent in hard-surface liquid household cleaners and water-based surface coatings and is also a component of hydraulic brake fluid. DPGME is also used in the manufacture of various cosmetics (HSDB 1985).

DPGME is an irritant and central nervous system depressant in humans and animals. The oral LD50 in rats is 5.2 g/kg (Rowe et al. 1954/Ex. 1-435). Dogs receiving intravenous injections of DPGME exhibited central nervous system depression and died as a result of respiratory failure (Shideman and Procita 1951/Ex. 1-667). Four animal species, including the monkey, were exposed repeatedly to seven-hour daily inhalation exposures of between 300 and 400 ppm DPGME; the animals exhibited narcosis and, at autopsy, histological changes in the lung and liver (Rowe, McCollister, Spencer et al. 1954/ Ex. 1-435).

Humans inhaling DPGME concentrations of 300 to 400 ppm judged this level to be very irritating and disagreeable, but 100 ppm was tolerable and, in the opinion of the authors, was unlikely to produce organic injury (Rowe, McCollister, Spencer et al. 1954/ Ex. 1-435). Patch tests on the skin of 250 human subjects produced neither irritation nor sensitization (ACGIH 1986/Ex. 1-3, p. 221). Humans exposed to DPGME vapor concentrations at levels between 50 to 2000 ppm experienced eye, nose, and throat irritation before the onset of CNS impairment, which occurred at 1000 ppm in one of two subjects (Stewart, Baretta, Dodd, and Torkelson 1970/Ex. 1-379).

During the general industry rulemaking, NIOSH (Ex. 150) reported that it is developing a criteria document on the glycol ethers and submitted recent toxicity data on DPGME, including the following: rats and mice inhaling concentrations of 50, 140, or 330 ppm DPGME six hours/day for nine days showed increased liver weights (at 50 and 140 ppm for the rat and at 330 ppm for the mouse), but no effects were observed when rats inhaled 15, 50, or 200 ppm DPGME 6 hours/day, 5 days/ week for 13 weeks (Landry and Yano 1984). A 1985 study also indicates that DPGME is metabolized via the same routes and to the same types of metabolites-propylene glycol, and sulfate and glucuronide conjugates of DPGME—as those previously identified for PGME (1-methoxy-2-propanol) (Miller, Hermann, Calhoun et al. 1985). The Landry and Yano study (1984) further indicated that, at the concentrations tested, DPGME exerted no teratogenic or reproductive effects. Even at the highest levels tested (19 g/ kg), no single application of DPGME to the skin of rabbits was lethal, although some narcosis and transient weight loss did occur (Rowe et al. 1954/Ex. 1-435). However, a significant number of deaths occurred in a group of rabbits tested

with 65 repeated dermal applications of

5 ml/kg (4.8 g/kg) or higher during a 90day period (Rowe et al. 1954/Ex. 1-435).

In construction and maritime, OSHA is retaining its 8-hour TWA PEL of 100 ppm and the skin notation and is proposing to add a STEL of 150 ppm for dipropylene glycol methyl ether; in addition, OSHA is proposing to extend these limits to agriculture. The Agency preliminarily concludes that these limits will substantially reduce the significant risks of central nervous system effects and irritation, which constitute material health impairments, that exist when workers in construction, maritime, or agriculture are exposed to DPGME even for short periods. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

n-HEXANE
CAS: 110-54-3; Chemical Formula:
CH₃(CH₂)₄CH₅
H.S. No. 1200

OSHA's current 8-hour PEL for n-hexane (normal hexane) is 500 ppm for the construction and maritime industries; there is no limit in agriculture. The ACGIH has a 50-ppm TLV*-TWA for this substance, and the NIOSH RELs are 100 ppm as a 10-hour TWA and 510 ppm as a 15-minute ceiling. OSHA is proposing an 8-hour TWA limit of 50 ppm for n-hexane for the agricultural, construction, and maritime industries; this was the limit recently established in general industry. NIOSH (Ex. 8-47, Table N1) concurs that an 8-hour TWA PEL of 50 ppm is appropriate for n-hexane.

Normal hexane is a clear, volatile liquid. It is used as a solvent for the extraction of soybean and various seed oils; in the manufacture of polyolefins, elastomers, and pharmaceuticals; and as a denaturant for alcohol.

The acute lethality of n-hexane is low; the lowest reported lethal concentration for mice is 33,330 ppm (Clayton and Clayton 198, p. 3186). However, it has been well established that chronic exposure to n-hexane produces distal axonopathy in both experimental animals and humans; it is metabolized to 2,5-hexanedione (2,5-HD), which is thought to be the causative agent of most of the adverse neurological effects observed after exposure to hexane (Schaumburg, Spencer, and Thomas 1983/Ex. 1–228).

The ACGIH established a TLV* of 50 ppm for this substance, based primarily on studies (Miyagaki 1967/Ex. 1–198; Inoue, Takeuchi, Takeuchi et al. 1970/Ex. 1–75) showing peripheral neuropathies in workers exposed to levels as low as 210 ppm. NIOSH based

its 100-ppm REL on the same studies as those cited by the ACGIH (Miyagaki 1967/Ex. 1–198; Inoue, Takeuchi, Takeuchi et al. 1970/Ex. 1–75). In the rulemaking for general industry, NIOSH reasoned as follows:

The absence of definitive epidemiologic or toxicologic evidence makes it difficult to determine how much lower the environmental limit should be. Professional judgment suggests [that] a TWA concentration of 350 mg/m³ (100 ppm) offers a sufficient margin of safety to protect against the development of chronic nerve disorders in workers (NIOSH 1977a/Ex. 1–233, p. 74).

The adverse neurological effects of hexane exposure are manifested as both sensory and motor dysfunction. Initially, there is a symmetric sensory numbness of the hands and feet, with loss of pain, touch, and heat sensation. Motor weakness of the toes and fingers is often present; as the neuropathy becomes more severe, weakness of the muscles of the arms and legs may also be observed (Schaumburg, Spencer, and Thomas 1983/Ex. 1-228). Clinical findings may include footdrop, muscle atrophy, and paresthesias (tingling) in the arms and legs. Biopsies of peripheral nerves show swelling of the nerve and thinning of the myelin sheath (Proctor, Hughes, and Fischman 1988, p. 271). There are no known conditions that predispose an individual to hexane neurotoxicity (Schaumburg, Spencer, and Thomas 1983/Ex. 1-228). The onset of neurological symptoms may not be evident for several months to a year after the beginning of exposure. Recovery may be complete but may require 1 to 2 years, and severely exposed individuals often retain some degree of sensorimotor deficit (Proctor, Hughes, and Fischman 1988, p. 271).

The dose-response relationship for nhexane exposure in humans is not well defined, although it is clear that the severity of the resulting neuropathy increases as the exposure level of nhexane increases. A number of studies have shown a consistent relationship between exposure levels of 500 ppm (OSHA's current exposure limit in construction and maritime) to 2000 ppm and the development of characteristic peripheral neuropathies (Yamamura 1969, as cited in ACGIH 1986/Ex. 1-3, p. 305; Yamada 1967/Ex. 1-192). Neuropathic effects have also been shown to occur at levels between 210 and 500 ppm (Takeuchi, Maluchi, and Takagi 1975/Ex. 1-217)

Two recent studies (Wang, Chang, Kao et al. 1986; Iida 1982) suggest that an exposure limit of 100 ppm would not sufficiently protect against the neuropathic effects of n-hexane exposure. Iida (1982) found 21 cases of mild neuropathy among workers in a sandal factory where ventilation systems were installed to achieve a 100-ppm concentration of n-hexane. In a cross-sectional study, Wang et al. (1986) found that workers in a press-proofing factory showed a significant decrease in motor nerve conduction velocities, despite the fact that n-hexane exposures were being maintained below 100 ppm.

Chronic exposure studies of n-hexane conducted in animals show effects consistent with those reported in human studies. Peripheral neuropathy has been demonstrated in rats exposed to 400 to 600 ppm n-hexane for 45 days and in mice exposed to 250 ppm for over 7 months. Degeneration of myelin and axis cylinders have been found in rats exposed to 850 ppm for 143 days (Kurita 1974; Ashbury, Nieben, and Telfer 1974; Gonzales and Downey 1972).

Reports of effects occurring at levels ranging from below 100 to 500 ppm indicate that the current OSHA PEL of 500 ppm is not adequate to protect exposed workers in construction and maritime from adverse sensorimotor neuropathic effects, and exposure at this level thus represents a significant risk to workers. The decreased sensitivity to pain, touch, and temperature associated with n-hexane exposure can also make a worker more susceptible to injuries and accidents. Further, the delayed onset of a clinical response, which is typical of hexane exposure, increases the probability that exposure will continue until prolonged or irreversible effects occur.

Both the presence of peripheral neuropathies in workers exposed below 100 ppm and the delay in the onset of neurological symptoms indicate that workers exposed at levels above the proposed 50 ppm limit are at significant risk of developing these symptoms. OSHA therefore proposes to revise the PEL for n-hexane to 50 ppm as an 8-hour TWA for workplaces in construction and maritime and to extend this PEL to agriculture. The Agency preliminarily concludes that this PEL will substantially reduce the significant risk of peripheral neuropathies and other adverse neuropathic effects that constitute material impairments of health and are associated with the exposures to levels above the proposed limit. In addition, promulgation of these limits will make OSHA's PEL for this substance consistent across all regulated sectors.

2-HEXANONE (METHYL n-BUTYL KETONE) CAS: 591-78-6; Chemical Formula:

CAS: 591–78–6; Chemical Formula: CH₃CO—CH₂CH₂CH₂CH₃ H.S. No. 1202

In construction, marine 'erminals, shipyards, and longshoring operations, OSHA's current PEL for 2-hexanone is 100 ppm as an 8-hour TWA. The NIOSH REL is a 1 ppm (10-hour) TWA, and the ACGIH recommends a TLV*-TWA of 5 ppm. In OSHA's recent Air Contaminants rulemaking for general industry, the final rule established a permissible exposure limit for this substance of 5 ppm as an 8-hour TWA; this is the limit being proposed for 2-hexanone in construction, maritime, and agriculture.

2-Hexanone (also called methyl butyl ketone) is a colorless, volatile liquid with a characteristic acetone-like odor that is more pungent than that of acetone. 2-Hexanone is used as a solvent for resins, oils, fats, waxes, and lacquers, and in lacquer and varnish removers (HSDB 1984).

2-Hexanone is an irritant and a neurotoxin both in humans and in animals. The oral LD50 in rats is 2590 mg/kg, and the LC50 in the same species is 8000 ppm for 4 hours (RTECS 1990). The dermal LD50 in rabbits is 4800 mg/kg (RTECS 1990). Animals exposed continuously to 100- or 600-ppm concentrations of 2-hexanone developed neuropathic signs within 4 to 8 weeks of the beginning of exposure; some animals showed axonal swelling and thinning of the myelin sheath at autopsy (Mendell et al. 1974). A metabolite of 2-hexanone, 2.5-hexanedione, appears to be responsible for the neural damage; this same metabolite is formed when nhexane (discussed above) is metabolized. Animals of several species. including rats, cats, dogs, monkeys, hens, and guinea pigs, have developed 2hexanone-related peripheral neuropathies (O'Donoghue 1985). Rats intermittently exposed over a period of 4 months to a 2-hexanone concentration of 1300 ppm displayed severe hind-limb weakness.

Vapor exposures of 1000 ppm 2hexanone caused moderate eye and nose irritation in human volunteers in a few minutes (Clayton and Clayton 1982, pp. 4741-4747). In addition to the textile printing plant episode described below. three cases of peripheral neuropathy have been seen in a group of 26 spray painters involved in construction; 2hexanone is believed to have been responsible for these cases (Rom 1983, pp. 524-525). Another group of workers exposed for 5 weeks or longer to 9- to 36-ppm concentrations of this substance developed distal polyneuropathy, complete with motor and sensory decrements (Gosselin, Smith, and Hodge 1984, p. II-185).

The NIOSH REL for 2-hexanone of 1 ppm (as a 10-hour TWA) is based on an epidemiologic study describing an outbreak of neurologic disease among workers in a plant that manufactures printed fabrics (Allen, Mendall, Billmaier et al. 1975/Ex. 1-80). This study reported that a screening of 1,157 exposed workers revealed 86 verified cases of distal neuropathy. 2-Hexanone was suspected of being the neurotoxicant because it had only recently been introduced into the process (Allen, Mendall, Billmaier et al. 1975/Ex. 1-80). When recommending its limit, NIOSH relied on an industrial hygiene survey of the plant conducted by Billmaier, Yee, Allen et al. (Ex. 1-76) in 1974, which showed that 2-hexanone concentrations near the textile printing machines ranged from 1 to 156 ppm (10minute area samples). After reviewing this evidence, NIOSH concluded that 1 ppm could not be ruled out as an effect level for 2-hexanone-induced neuropathy (NIOSH Criteria Document). OSHA is not persuaded by NIOSH's reasoning in this instance, both because the samples taken in the plant were area rather than personal samples and because workers at the plant reportedly washed their hands in 2-hexanone. OSHA believes that the area samples were likely to have reflected higher concentrations than the workers would have experienced and that the outbreak described in the NIOSH Criteria Document resulted, at least in part, from percutaneous absorption of this substance.

Both human and animal studies show the development of neuropathic disease at exposure concentrations well below the current 100-ppm PEL; OSHA preliminarily concludes that a reduction in the PEL is needed to reduce this significant risk. Accordingly, OSHA is proposing a 5-ppm (8-hour TWA) PEL for 2-hexanone in construction, maritime, and agricultural workplaces. In addition, promulgation of these limits will make OSHA's PEL for this substance consistent across all regulated sectors. IRON PENTACARBONYL

CAS: 13463-40-6; Chemical Formula: Fe(CO)₅

H.S. No. 1216

In construction, shipyards, marine terminals, and longshoring operations, OSHA currently has no exposure limit for iron pentacarbonyl. The ACGIH has a TLV*-TWA (measured as iron) of 0.1 ppm and a TLV*-STEL of 0.2 ppm for iron pentacarbonyl. NIOSH has no REL for iron pentacarbonyl but concurs (Ex. 8-47, Table N1) that these limits are appropriate. The Agency is proposing

permissible exposure limits of 0.1 ppm (TWA) and 0.2 ppm (STEL) for iron pentacarbonyl in the construction, maritime, and agriculture sectors: this is the limit recently established in general

Iron pentacarbonyl is used in iron production, as an anti-knock fuel additive, and as a catalyst and reagent in chemical synthesis (HSDB 1989). This substance is an oily liquid that is either colorless or yellow (HSDB 1985).

Iron pentacarbonyl is a lung and central nervous system toxin on acute exposure. The oral LD50 in rats is 40 mg/ kg, and the LC60 in the same species is 44 mg/m3 (no duration specified) (RTECS 1989). The dermal LD50 in rabbits is 240 mg/kg (RTECS 1989). In 1970, Gage found that a 5.5-hour exposure to a 33-ppm concentration of iron pentacarbonyl caused fatalities in three of eight rats; four of eight animals died after two 5.5-hour exposures at 18 ppm. At 7 ppm, no ill effects were observed in rats exposed 18 times in 5.5 hours (Gage 1970/Ex. 1-318).

Immediate symptoms of acute exposure to high concentrations of iron pentacarbonyl include headache and dizziness, followed in 12 to 36 hours by fever, cyanosis, cough, and shortness of breath. Another clinical effect of overexposure to this substance is lung injury, and degenerative changes in the central nervous system have also been reported. Iron carbonyl is the least toxic of the metal carbonyls (Clayton and

Clayton 1982, p. 1797). Based on these findings in humans and animals, OSHA is proposing permissible exposure limits of 0.1 ppm (TWA) and 0.2 ppm (STEL) for iron pentacarbonyl. The Agency preliminarily concludes that these limits will protect workers in construction. maritime, and agriculture from the significant risks of material health impairment in the form of exposurerelated headache, dizziness, fever, dyspnea, cyanosis, pulmonary injury, and central nervous system effects. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

LINDANE CAS: 58-89-9; Chemical Formula: C6H6Cl6 H.S. No. 2100

The current OSHA PEL for lindane in general industry, construction, and maritime is 0.5 mg/m3 as an 8-hour TWA, with a skin notation. There is no PEL for lindane in agriculture. The ACGIH TLV*-TWA for this substance is 0.5 mg/m3, with a skin notation; NIOSH has no REL for lindane but concurs with

the limit being proposed (Ex. 8-47, Table N3A). OSHA is proposing a PEL of 0.5 mg/m3 as an 8-hour TWA, with a skin notation, for lindane in agriculture. Promulgation of this limit will make the PEL for lindane consistent across all OSHA-regulated sectors.

Lindane, also called benzene hydrochloride or BHC, is a colorless to white crystalline solid with a faint musty odor (HSDB 1986). Lindane is used as an insecticide for field crops, ornamentals, timber, soil and seed treatment, stored products, and in household use. It is used in human medicine as a scabicide and pediculicide, most often as a 1-percent lotion, cream, or shampoo. Lindane is also used in veterinary medicine (HSDB 1986; Grant 1986, p. 561). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Lindane is a convulsant in both animals and humans; it is an irritant of the eyes, nose, and upper respiratory tract and has been associated with the development of aplastic or hypoplastic anemia and leukemia in humans. This substance also has carcinogenic, reproductive, and embryotoxic effects in experimental animals. The oral LD50 in rats is 76 mg/kg, and the dermal LD50 in rabbits is 50 mg/kg (RTECS 1990). Following a single dose of lindane, the convulsion threshold in mice decreases; 2 days after administration, however, the threshold increases (Hulth et al. 1978). Lindane also has reproductive and embryotoxic effects in rats (IARC 1974, Vol 5; Petrescu et al. 1974, in Rev. Med. Chin. Soc. Nat. 1951 78(4):831-842). Rats gavaged daily with 32 mg/kg lindane for 6 months developed nervous symptoms and showed fatty degeneration of the liver and renal tubular epithelium and vacuolization of cerebral cells at autopsy (NRC 1977, p. 587). Minor lesions of the liver have been seen in rats dosed with lindane at 2.6 to 5 mg/kg/day and in mice dosed with 6 to 10 mg/kg/day. Rodents exposed orally to high doses developed degenerative changes in the kidney. pancreas, and testes (Hayes 1982, pp. 211-229). Oral administration of lindane has caused thyroid tumors in rats, and mice developed liver tumors, sometimes with lung metastases, when administered lindane orally (IARC 1987. Suppl. 7, p. 221; IARC 1979, Vol. 20, p. 189). Based on this evidence, the International Agency for Research on Cancer has concluded that the evidence of lindane's carcinogenicity in animals is sufficient (IARC 1987, Suppl. 7, p. 221).

Rats fed 1500 ppm in the diet for 90 days developed testicular atrophy, spermatogenic arrest, and apparent inhibition of androgenesis (Shivanandappa and Krishnakumari 1983). Lindane is mutagenic in mammalian test systems (RTECS 1987).

Acute exposure to lindane vapor at unspecified concentrations causes irritation of the eyes, nose, and upper respiratory tract in humans (AIHA 1972). Accidental ingestion of lindane has caused repeated, violent, and fatal convulsions in humans; respiratory difficulty and cyanosis were also seen in these cases. Nonlethal ingestions have been associated with convulsions. tremor, fever, cyanosis, loss of consciousness, dizziness, and nausea (Hayes 1963; Hayes 1982, p. 222). Neurological studies of 37 workers exposed to lindane for 2 years showed that these workers had serious electroencephalographic disturbances and that 14 workers had minor neurological symptoms (Czegledi-Janko and Avar 1970). Four cases of leukemia have been reported in men exposed to lindane with or without other chemical exposures, and agricultural workers exposed to lindane and other pesticides have shown an increase in lung cancer mortality; however, the International Agency for Research on Cancer (IARC) has concluded that the evidence of lindane's carcinogenicity in humans is inadequate (IARC 1987, Suppl. 7, p. 220).

Based on this evidence in humans and animals, OSHA is proposing a 0.5 mg/m³ 8-hour TWA PEL, with a skin notation, to protect workers in agriculture from the significant risk of adverse health effects caused by exposure to lindane. The Agency preliminarily concludes that this limit is necessary to substantially reduce a significant risk of material health impairment in exposed workers. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

MANGANESE compounds CAS: 7439–96–5; Chemical Formula: Mn H.S. No. 2103

In general industry, construction, and maritime, OSHA's current limit for manganese and its compounds is 5 mg/m³ (measured as manganese) as a ceiling. There is no limit in agriculture. The ACGIH has a TLV[®] of 5 mg/m³ as an 8-hour TWA, and NIOSH has a REL of 5 mg/m³ for the metal and its compounds, also as a ceiling, OSHA is proposing a 5-mg/m³ ceiling limit for manganese and its compounds in agriculture; this action will make the

PELs for manganese and its compounds consistent across all regulated sectors.

Manganese is a reddish-gray or silvery powder or metal that has no odor. Some of the more important manganese compounds are manganese dioxide, manganese tetroxide, manganous carbonate, manganous chloride, manganous acetate, and potassium permanganate. Manganese is used in steelmaking as a component of ferrous alloys, in other operations to make nonferrous alloys, in the manufacture of dry cell batteries, and in the production of chemicals (Clayton and Clayton 1981, p. 1750).

Manganese is a central nervous system toxin on chronic exposure and causes metal fume fever on acute exposure. The oral LD50 in rats is 9 g/kg (RTECS 1990). Instilled into the eyes of rabbits, manganese caused a mild degree of irritation; contact with the skin of rabbits also caused mild irritation (RTECS 1990). Subcutaneous doses of 50 mg/kg manganese chloride caused death in mice, rabbits, and guinea pigs (Cervinka 1929, in Compte Rend, Soc. (France) 102:262). Injected intratracheally into the lungs of rats. both manganese oxide and manganese chloride at doses of 10 mg/kg immediately caused histological changes in the lung tissues; before death, the animals injected with the chloride developed pulmonary edema (Davies and Harding 1949, in Br. J. Ind. Med. 6:82). Rabbits exposed to manganese dust for 4 hours/day for 3 to 6 months at concentrations of 10 to 20 mg/m3 developed fibrotic lung changes but no pneumonitis; a depression in the number of red blood cells and hemoglobin also occurred (Carratala and Carboneschi in ACGIH 1986, p. 354(86)). Monkeys inhaling a manganese aerosol showed agitation, followed by torpor, nervousness, tremor, flexion and extension of the limbs, and cyanosis; these signs disappeared within 3 weeks of the exposure but returned in more severe form 5 months later (van Bogaert and Dallemagne 1945, in Mgsch. Psychiatr. Neurol. 111:60, as cited in Clayton and Clayton 1981, p. 1755).

In humans, chronic exposure to manganese or its compounds causes a form of poisoning known as manganism; the signs and symptoms of this condition strongly resemble those of parkinsonism. Workers with manganism experience languor, sleepiness, limb weakness, and spastic gait and develop a mask-like appearance of the face as well as emotional instability (Fairhall and Neal 1943, in Natl. Inst. Health Bull. No. 182; Flinn, Neal, Reinhart et al. 1940, in U.S. Pub. Hlth. Serv. Bull. No. 247), The onset of manganism occurs between

6 months and 24 years of first exposure to manganese (Clayton and Clayton 1981, p. 1756). Manganese psychosis. characterized by uncontrollable laughter, impulsive behavior, euphoria. and insomnia, also occurs in many cases (Clayton and Clayton 1981, p. 1762). Although disabling, manganism is rarely fatal; in the early stages, the condition is reversible (Rom 1983, p. 494). The exposure concentrations associated with the development of manganism ranged from 6.8 to 42.2 mg/m3 in a group of manganese miners; other evidence suggests that exposures to concentrations of 5 mg/m3 and above are associated with definite signs and symptoms (Emara et al. 1971, in Br. J. Ind. Med. 28:78-82; Tanaka and Lieben 1969/Ex. 1-388).

Acute exposure to manganese dust and fumes causes metal fume fever, with chills, fever, nausea, sweating, and cough (Piscator 1976, in Environ. Res. 11:268–270). Symptoms onset 4 to 24 hours after the acute overexposure and disappear if exposure is not resumed for several days (Piscator 1976). Exposure to manganese dust also causes mild sensory irritation of the eyes, mucous membranes, and skin (Rom 1983, p. 493).

Based on this evidence in humans and animals, OSHA preliminarily concludes that exposure to manganese and its compounds is associated with a significant risk of acute and chronic disease in the form of pneumonitis and manganism, respectively. The Agency considers these adverse health effects material impairments of health and believes that the proposed PEL of 5 mg/ m3, as a ceiling, is necessary to reduce a significant risk among workers in the agriculture industry. In addition, promulgation of this limit will make the PEL for manganese and its compounds consistent across all OSHA-regulated sectors.

MANGANESE FUME CAS: 7439–96–5; Chemical Formula: MnO H.S. No. 1236a

In construction, marine terminals, shipyards, and longshoring operations, OSHA currently has a ceiling limit of 5 mg/m³ for manganese fume (measured as manganese). There is no limit in agriculture. Because of this substance's potential to cause damage to the lungs and central nervous system, the ACGIH recommends an 8-hour TLV*-TWA of 1 mg/m³ and a 3-mg/m³ TLV*-STEL for manganese fume. NIOSH has no REL for this substance but concurs (Ex. 8-47, Table N1) that the limits OSHA is proposing are appropriate for this substance; these limits are 1 mg/m³ as

an 8-hour TWA and 3 mg/m³ as a 15minute STEL. These are the limits recently established for this substance

in general industry.

Manganese fume is the finely divided particulate generated when manganese metal is melted; the fume is gray or black in color. In experimental animals, daily 4-hour inhalation exposure to manganese dust (particle size not specified) caused fibrotic lung changes at concentrations of 10 to 20 mg/m³ for 3 to 6 months (ACGIH 1986, p. 354(86)). Russian studies have shown pulmonary effects in young rats administered intratracheal suspensions of mixed manganese oxides having particle sizes of less than 3 microns (Levina and Robachevsky 1955).

Symptoms of manganese poisoning in humans range from sleepiness and weakness in the legs (Fairhall 1957a) to difficulty in walking and uncontrolled laughter (Fairhall and Neal 1943). Health surveys of employees exposed to manganese fume have demonstrated a high incidence of pneumonia in these workers (Davies 1946). Tanaka and Lieben (1969/Ex. 1-388) found seven cases of pneumonia and 15 cases of borderline pneumonia among 144 workers exposed to manganese dust or fume concentrations greater than 5 mg/ m3; three of these cases were associated with fume rather than dust exposure. Those workers exposed to fume levels below 5 mg/m3 exhibited no signs of pneumonia. In a separate study by Smyth, Ruhf, Whitman, and Dugan (1973/Ex. 1-990), three cases of manganese poisoning were detected among 71 employees exposed to 13.3 mg/m³ concentrations of manganese

In the prior rulemaking, OSHA received one comment (Ex. 3-189) supporting the proposed limits for manganese fume and another (Ex. 3-829) objecting to the proposed change in PELs. In response to the latter commenter, OSHA emphasized that exposure to manganese fume has been demonstrated to cause toxic effects in both humans and animals. Workers exposed to manganese fumes have developed pneumonia (Tanaka and Lieben 1969/Ex. 1-388), and Stokinger (1981f, p. 1767) reports that the proposed 1-mg/m3 limit "is supported by the finding in animals that the higher oxides are more toxic, and the report of an occasional case of Mn poisoning in susceptible workers exposed to ferro Mn fumes around the 1-mg/m3 limit."

Based on this evidence, OSHA is proposing a 1-mg/m³ 8-hour TWA PEL and a 3-mg/m³ 15-minute STEL for manganese fume. The Agency preliminarily concludes that both a

TWA limit and a STEL are required to protect employees in construction, maritime, and agriculture from the significant risks of manganism, lung damage, and pneumonitis, all of which constitute material health impairments that are associated with exposure to these fumes. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

MANGANESE CYCLOPENTADIENYL TRICARBONYL

CAS: 12079-65-1; Chemical Formula: C₆H₈--Mn(CO)₈ H.S. No. 1237

In construction, maritime, and agriculture, OSHA has no limit for manganese cyclopentadienyl tricarbonyl [MCT]. The ACGIH has a TLV*-TWA of 0.1 mg/m³ (measured as manganese), with a skin notation. NIOSH has no REL but concurs (Ex. 8-47, Table N1) that the limit OSHA is proposing is appropriate; this limit is an 8-hour TWA of 0.1 mg/m³. A skin notation is also proposed. Both the 0.1 mg/m³ 8-hour TWA PEL and the skin notation were recently established for MCT in general industry.

MCT is used as an antiknock agent in gasoline; no data on its physicochemical properties are available (ACGIH 1986, p.

356).

MCT is a convulsant and neuropathogen in animals. The oral LD₅₀ in rats is 80 mg/kg, and the lowest lethal concentration by inhalation is 120 mg/m³ for 2 hours (RTECS 1990). Acutely poisoned animals exhibit the following symptoms regardless of the route of exposure: excitement, hyperactivity, tremors, toxic spasms, weakness, clonic convulsions, difficult breathing, and coma; at autopsy, liver and kidney damage is seen (Stara, Moore, Hysell, et al. 1974).

A Russian study reports that a single two-hour exposure to MCT at 120 mg/ m³ was fatal to 80 percent of albino rats, although rabbits, guinea pigs, and rats survived a single 2-hour exposure to 20 to 40 mg/m3. Chronic exposure of rats for 11 months to concentrations averaging 1 mg/m3 for four hours daily caused delayed effects (seven months from onset of exposure) consisting of neuromuscular excitability, evidence of kidney damage, and decreased resistance to infection (Arkhipova, Tolgskaya, and Kochetkova 1965/Ex. 1-1046). The tails of 10 white mice were dipped in a gasoline mixture containing 1 gram MCT per 100 ml; a second group of mice had their tails immersed in gasoline without MCT. An equal number of fatalities were observed in the gasoline plus MCT and gasoline-only groups after four or five 2-hour

applications, and all tails exhibited necrosis. The authors concluded that these effects were caused by the gasoline and not by the MCT (Arkhipova, Tolgskaya, and Kochetkova 1965/Ex. 1-1046). Further studies in rabbits showed that MCT applied dermally as an oil emulsion caused irritation of the skin. These authors also investigated the dermal toxicity of MCT solutions in tetrahydrofuran versus solutions of tetrahydrofuran in oil. All animals whose tails had been dipped in the hydrofuran solution of MCT died within an hour, while animals whose tails had been dipped in pure tetrahydrofuran did not (Arkhipova, Tolgskaya, and Kochetkova 1965/Ex. 1-1046). The same authors concluded that MCT is toxic at low concentrations, has cumulative properties, affects the nervous system, is trritating to the skin, and causes early histological changes in the respiratory trace

More recent reports describe MCT-induced pulmonary edem.* and convulsions in the rat (Peaney, Hogberg, Traiger, and Hanzlik 1985, Ex. 1–431). The ED₅₀s for convulsions were 32 mg/kg orally and 20 mg/kg intraperitoneally; LD₅₀s were 24 mg/kg orally and 14 mg/kg intraperitoneally. Necrosis of the bronchiolar tissue and pulmonary parenchymal damage were seen in mice and rats given intraperitoneal doses (Haschek, Hakkinen, Witschi et al. 1982/Ex. 1–1083).

Based on this evidence, OSHA has preliminarily concluded that occupational exposure to MCT poses a significant risk of neuropathic effects, kidney damage, skin irritation, and pulmonary edema, which together clearly constitute material impairments of health. The Agency is therefore proposing to establish an 8-hour TWA PEL of 0.1 mg/m3 for manganese cyclopentadienyl tricarbonyl, with a skin notation, to protect workers in construction, maritime, and agriculture against the significant risk of these effects. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

MANGANESE TETROXIDE
CAS: 1317-35-7; Chemical Formula:
Mn₃O₄
H.S. No. 1238

OSHA has no exposure limit in construction, maritime, or agriculture for manganese tetroxide. The ACGIH recommends a TLV*-TWA of 1 mg/m³ (measured as manganese) for this brownish-black powder and its dust and fume. There is no NIOSH REL for this substance. OSHA is proposing a PEL of

1 mg/m³ TWA for manganese tetroxide (measured as Mn). This is the limit recently established for this substance

in general industry.

Manganese tetroxide is a brownish black powder. It is generated during the pouring and casting of molten ferromanganese or the heating of manganese oxides (ACGIH 1986, p. 357).

Manganese tetroxide affects the nervous system and produces manganism in exposed individuals. This substance also damages the lungs. Findings from a Russian study indicate that intratracheal suspensions of manganese oxide, manganese dioxide, and manganese tetroxide particles (particle size less than 3 um) produced pneumonitis and other pulmonary effects in rats (Levina and Robachevskiau 1955/Ex. 1-1041). These investigators also determined that manganese tetroxide has greater toxicity than the lower oxides of manganese and that freshly prepared oxides are more potent than those stored for six months to one year. Two cases of manganese fume poisoning were reported in a plant where concentrations were between 2.7 and 4.7 mg/m3 (Whitlock, Amuso, and Bittenbender 1966/Ex. 1-455), but other investigators have questioned these air sampling results and believe that exposures to manganese tetroxide concentrations of 5 mg/m3 or less cause no harmful effects (Whitman and Brandt 1966/Ex. 1-1103).

In a 7-year study, Smyth and coworkers (1973/Ex. 1-990) investigated chronic manganese poisoning in workers exposed to both ferromanganese fumes and dust. Five of 71 employees suffered from chronic manganism; of these five cases, three resulted from fume exposure and two from dust exposure. Two of the three fume-exposed victims had been exposed over a five-year period to an estimated average ferromanganese concentration of 13.3 mg/m3; however, the third victim worked in an operation where ferromanganese concentrations of manganese were less than 1 mg/m3, which suggests that certain individuals may be hypersusceptible to manganese poisoning. The dust-exposed victims worked in areas where air concentrations were in the range of 30 to 50 mg/m3 throughout the study period (Smyth, Ruhf, Whitman, and Dugan 1973/Ex. 1-990).

Martonik (1976, as cited in ACGIH 1986, p. 357) reported that the fume of manganese has greater toxicity than the dust. During a two-year period, at least one case of acute manganese poisoning was documented at a fume concentration level of 7.5 mg/m3, and another case at the same welding

operation may also have involved manganism.

NIOSH (Ex. 8-47; Tr. p. 3-86) commented in the earlier rulemaking that, based on the results of the Smyth and co-workers study (1973/Ex. 1-990), the 1-mg/m3 PEL being proposed by OSHA "may not be protective, especially to the potentially sensitive individual." OSHA is seeking comments on the appropriateness of the proposed limit for workplaces in construction, maritime, and agriculture.

Another commenter in the prior rulemaking (Ex. 3-189) asked OSHA to promulgate separate limits for the dust and fume of manganese tetroxide based on the relative toxicities of these two particulate forms. OSHA recognizes that some information in the literature (including some discussed above) points to the greater toxicity of the fume and that fumes are generally the more toxic form of particulate. However, the Agency notes that intratracheal suspensions of manganese tetroxide dust caused pneumonitis and other pulmonary effects in Russian workers (Levina and Robachevskiau 1955/Ex. 1-1041) and that several cases of manganism have been caused by manganese dust exposure (Smyth, Ruhf, Whitman, and Anger 1973/Ex. 1-990). The Agency thus believes that it would not be prudent at this time to distinguish between the dust and the fume but to propose an 8-hour TWA PEL that will protect against the effects of exposure to both forms of particulate.

In construction, maritime, and agriculture OSHA is proposing to establish a 1-mg/m 3 8-hour TWA PEL for manganese tetroxide. The Agency preliminarily concludes that this limit will provide protection to workers in these sectors from the significant risks of material health impairment in the form of chronic m. anganese poisoning, pneumonitis, and other respiratory and neurotoxic effects that are associated with exposure to manganese tetroxide at concentrations above 1 mg/m3. In addition, promulgation of these limits will make OSHA's PEL for this substance consistent across all regulated sectors.

MERCURY (ARYL AND INORGANIC COMPOUNDS)

CAS: 7439-97-8; Chemical Formula: Hg H.S. No. 1240

For the construction and maritime industries, OSHA's current limit for all inorganic forms of mercury (Hg) (which includes aryl Hg) is 0.1 mg/m3 as an 8hour TWA, with a skin notation; this limit was adopted from the 1970 ACGIH TLV# for inorganic mercury. There is no PEL in agriculture. The ACGIH has a

TLV -TWA of 0.1 mg/m3 with a skin notation or these substances. NIOSH (1973b) has recommended a 0.05-mg/m3 limit as an 8-hour TWA for mercury. OSHA is proposing to revise its exposure limit for aryl and inorganic mercury (measured as mercury) to 0.1mg/m3 as a ceiling limit, together with a skin notation, and to apply this limit to workplaces in construction, maritime, and agriculture. NIOSH (Ex. 8-47, Table N1) concurs with this limit, which is the same PEL that was recently promulgated for these forms of mercury in general industry.

Mercury compounds are used in fungicides and preservatives; in dry cells; as catalysts and pigments; and in medicine. Mercuric nitrate was formerly used to manufacture fur felt hats (ACGIH 1986/Ex. 1-3, p. 359); the expression "mad as a hatter" derives from this use. When used in pesticidal applications and in accordance with the label, these substances are regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

The soluble mercuric salts are highly poisonous when ingested; oral LD50s for various animal species range from 1.0 to 18 mg/kg. Acute poisoning by mercury salts is rare in occupational settings; more important in this context are lowlevel chronic exposures, which are associated with the development of mercurialism. This disorder involves the central nervous system and results in tremors and neuropsychiatric disturbances (NIOSH 1973/Ex. 3-828, p. 18). The neurological effects of mercury poisoning are well known and have been extensively studied in humans for many years (see the discussion of mercury vapor, below). In addition, chronic low-level exposure to mercuric salts has been associated with glomerular disease (NIOSH 1973b/Ex. 3-828, p. 18).

In 1971, shortly after OSHA adopted the 0.1-mg/m3 TWA limit for inorganic mercury in construction and maritime, the ACGIH reduced the TLV*-TWA for all forms of mercury, including the inorganic compounds, to 0.05 mg/m3. ANSI also reduced its standard to 0.05 mg/m³ in 1972, and NIOSH recommended this same limit in 1973. The 0.05-mg/m³ limit was based largely on the study of Smith, Vorwald, Patil, and Mooney (1970/Ex. 1-373) of workers exposed to mercury levels ranging from less than 0.1 to 0.27 mg/m3 in chloralkali manufacturing plants. The authors reported a significant dose-related increase in the incidence of weight loss, tremors, abnormal reflexes, nervousness, and insomnia among workers exposed to concentrations of

0.1 mg/m3 or more. There were slight increases in incidences of insomnia and loss of appetite among workers exposed to 0.1 mg/m3 or less. Smith, Vorwald, Patil, and Mooney (1970/Ex. 1-373) concluded that a limit of 0.1 mg/m3 contained little or no margin of safety. Other studies (Bidstrup, Bonnell, Harvey, and Locket 1951/Ex. 1-1014; Turrian, Grandjean, and Turrian 1956) have also reported symptoms of mercury poisoning among workers exposed below 0.1 mg/m3. The 0.05-mg/m3 limit established by the ACGIH, ANSI, and NIOSH also followed the 1968 recommendation of an international committee (Permanent Commission and International Association on Occupational Health 1968).

In 1980, the ACGIH raised its recommended TLV® for aryl and inorganic mercury compounds from 0.05 mg/m³ to 0.1 mg/m³. In revising this limit, the ACGIH cited discrepancies in the literature regarding the ratio of blood and urinary mercury levels to airborne concentrations of mercury (Bell, Lovejoy, and Vizena 1973/Ex. 1-1078; Stopford et al. 1978/Ex. 1-1100). These studies reported that the mercury body burden to airborne concentration ratio was lower when personal sampling, rather than area sampling, was used. According to Bell, Lovejoy, and Vizena (1973/Ex. 1-1078), the lower ratio occurs when personal samples are being collected because contaminated clothing increases the amount of mercury inhaled, thus decreasing the ratio. On this basis, the ACGIH argued that the 0.05-mg/m3 limit may be too stringent when personal monitoring is performed. The ACGIH also believes that, in contrast to the effects of elemental or alkyl mercury, little mercury is deposited in the brain following exposure to aryl or inorganic mercury compounds. This reasoning led the ACGIH to adopt the higher 0.1-mg/ m3 TLV*-TWA for aryl and inorganic compounds of mercury. However, the ACGIH (1986/Ex. 1-3, p. 358) also noted that, although central nervous system effects are less likely to occur from exposure to mercury salts than from other forms of mercury, the risk of renal and other effects would "presumably be just as great," and therefore that the higher limit for mercury salts "may be subject to debate" (ACGIH 1986/Ex. 1-3, p. 358).

In the prior rulemaking, Robert G. Smerko, President of the Chlorine Institute (Ex. 3–823; Tr. pp. 10–171 to 10–177), reviewed the pharmacologic evidence on the various forms of mercury and concluded that there is little difference in brain deposition

between elemental mercury and mercury compounds:

The ACGIH differentiated between aryl mercury and inorganic salts of mercury in comparison with elemental mercury vapor
* * * While this is true for large doses of mercury, it overlooks the fact that absorbed elemental mercury is rapidly oxidized in the blood as reported by Clarkson et al.

[1967] * * *

Only when the rate of absorption exceeds the rate at which the body can oxidize mercury between the point of absorption and the brain does elemental mercury behave differently than aryl mercury and inorganic salts of mercury at the blood-brain barrier (Ex. 3-828, p. 7).

In light of this information, which counters the basis for the 0.1-mg/m3 ACGIH TWA®-TLV, and given the caution expressed by the ACGIH (1986/ Ex. 1-3, p. 358) that the 0.1-mg/m3 TWA limit "may be subject to debate," OSHA preliminarily concludes that the PEL for aryl and inorganic mercury in construction, maritime, and agriculture should be 0.1 mg/m3 as a ceiling limit. The health studies cited above indicate that reducing the limit for these forms of mercury will ensure that employees are not at significant risk of adverse neuropathic effects from exposure to these forms of mercury and their compounds. Accordingly, OSHA is proposing to establish a 0.1-mg/m3 ceiling limit with a skin notation for aryland inorganic mercury and its compounds (measured as mercury) in agriculture, maritime, and construction. OSHA is also proposing to add a skin notation to this limit to alert employers to the fact that mercury readily penetrates the skin to cause systemic poisoning; several cases of poisoning via this route have been reported (NIOSH 1973b; Ex. 3-828). OSHA is proposing to establish a PEL of 0.1 mg/m3 as a ceiling with a skin notation for aryl mercury and the inorganic compounds. OSHA believes that this limit is necessary to protect exposed workers in these sectors from the significant risks of neuropathy and systemic toxicity (both of which constitute material impairments of health) that are associated with exposure to these substances at higher levels. In addition, promulgation of these limits will make OSHA's PEL for these substances consistent across all regulated sectors. MERCURY (VAPOR) CAS: 7439-97-6; Chemical Formula: Hg

OSHA's current limit for mercury (including vapor) in construction and maritime is 0.1 mg/m³ as an 8-hour TWA, with a skin notation. There is no limit in agriculture. The ACGIH recommends a TLV*-TWA of 0.05 mg/

H.S. No. 1241

m³ for mercury vapor, measured as mercury, and a skin notation. NIOSH has a REL of 0.05 mg/m³ for this substance as an 8-hour TWA. The Agency is proposing to reduce its limit for mercury vapor in construction and maritime to a PEL of 0.05 mg/m³ TWA, with a skin notation, and to extend this limit to agriculture. NIOSH (Ex. 8-47, Table N1) concurred that this limit is appropriate when it was established recently in general industry.

Elemental mercury is a silvery, odorless, heavy liquid. Elemental mercury is the only heavy metal that exists in a liquid state at ambient temperature. Because of this unique property, elemental mercury is used in many devices such as thermometers, barometers, manometers, electrical instruments, mercury vapor and fluorescent lamps, dental amalgams, and batteries. It is also used as a lubricant and in the production of caustic soda and chlorine (ACGIH 1986/Ex. 1-3, p. 359; HSDB 1986).

Exposure to mercury vapor presents both an acute and chronic health hazard. Inhalation of high concentrations of mercury vapor for relatively brief periods can cause pneumonitis, bronchitis, chest pain, dyspnea, coughing, stomatitis, gingivitis, salivation, and diarrhea (NIOSH 1973b/Ex. 3–828; Ashe, Largent, Dutra et al. 1953/Ex. 1–502). Chronic mercurialism is manifested by central nervous system effects, including tremor, a variety of neuropsychiatric disturbances, and loss of appetite (Kazantzis 1968; Smith, Vorwald, Patil, and Mooney 1970/Ex. 1–373).

Severe organ damage occurred in rabbits exposed for 4 hours to an average mercury vapor concentration of 28.8 mg/m3. Damage was observed in the kidneys, liver, brain, heart, lungs, and colon (Ashe, Largent, Dutra et al. 1953/Ex. 1-502). A study by Smith, Vorwald, Patil, and Mooney (1970/Ex. 1-373) of 567 male workers exposed to a mean exposure level of 0.065 mg/ms (S.D. ± 0.085) showed a significant dose-related increase in the incidence of weight loss, tremors, abnormal reflexes, nervousness, and insomnia among workers exposed to concentrations of 0.1 mg/m3 or higher. There were slight increases in the incidence of insomnia and loss of appetite among workers exposed to 0.1 mg/m3 or less. Smith, Vorwald, Patil, and Mooney (1970/Ex. 1-373) concluded that a limit of 0.1 mg/ m³ contained little or no margin of safety. Six of 75 workers regularly exposed to 0.05 to 0.1 mg/m5 of mercury vapor in a glassware manufacturing plant reported insomnia, and one was

found to have tremors (Danziger and Possick 1973/Ex. 1–504). One of 11 workers employed in a mercury mine or refining plant and exposed at vapor concentrations below 0.1 mg/m³ had sore gums, loose teeth, or excess salivation (Rentos and Seligman 1968/Ex. 1–523).

Two studies report no evidence of mercury vapor poisoning in industrial settings where characteristic exposures ranged between 0.05 and 0.1 mg/m3 (Danziger and Possick 1973/Ex. 1-504; McGill, Ladd, Jacobs, and Goldwater 1964/Ex. 1-520). In workers exposed at levels above 0.1 mg/m3, however, toxic symptoms were seen (Rentos and Seligman 1968/Ex. 1-523). Turrian, Grandjean, and Turrian (1956) found that 33 percent of workers exposed to the vapor at levels above 0.05 mg/m3 exhibited hyperexcitability, while only 8 percent of those exposed below that level manifested this symptom. About 20 percent of workers in both groups exhibited tremor. The ACGIH notes that, after exposure to the vapor, "a relatively high percentage of the absorbed mercury remains in the brain," compared with the amount deposited in the brain after exposure to the aryl and inorganic compounds (ACGIH 1986/Ex. 1-3, p. 359). The ACGIH accordingly recommends a higher TLV*-TWA for aryl and inorganic mercury than for mercury vapor (see, however, the discussion of aryl and inorganic mercury in this preamble).

Despite some of the uncertainties in the studies described above regarding the dose-response relationship between airborne exposure levels and health effects, OSHA believes that the data suggest that the current TWA PEL of 0.1 mg/m³ is not sufficiently protective. Given the severity of the neuropathic effects caused by mercury poisoning, OSHA believes that a reduction in the airborne limit is necessary to ensure that workers in construction, maritime, and agriculture are not at significant risk of mercury-related neuropathic effects. Therefore, OSHA is proposing to revise its PEL for elemental mercury vapor to 0.05 mg/m3 as an 8-hour TWA in agriculture, construction, and maritime. In addition, because skin absorption is a significant route of exposure and leads to systemic poisoning, OSHA is proposing a skin notation. The Agency preliminarily concludes that the 0.05 mg/m3 TWA limit and skin notation will substantially reduce the significant risks of acute and chronic mercury poisoning (which constitute material health impairments) that have been demonstrated to occur at exposure levels above 0.05 mg/m3. In addition,

promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. MERCURY, (ORGANO) ALKYL

COMPOUNDS CAS: 7439-97-6 H.S. No. 1242

OSHA's current limit for organomercury compounds in the construction and maritime industries is 0.01 mg/m3 as an 8-hour TWA, with a skin notation. The ACGIH has a TLV®-TWA of 0.01 mg/m3 and a TLV*-STEL of 0.03 mg/m3, with a skin notation, for these compounds, measured as mercury. The Agency is proposing to retain its permissible exposure limits of 0.01 mg/ m3 as an 8-hour TWA, with a skin notation, in construction and maritime, to add a 0.03 mg/m3 STEL and to extend these limits to agriculture. In the prior rulemaking for general industry, NIOSH concurred (Ex. 8-47, Table N1) with these limits, which are now established in that sector.

Alkyl mercury compounds include volatile liquids, such as dimethyl and diethyl mercury, as well as many complex salts, which are usually solids. These compounds are used as fungicides in seed dressings, folial sprays, and preservatives for wood, paper pulp, textiles, and leather. When used in pesticidal applications and in accordance with the label, these substances are regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Alkyl mercury compounds pose greater health hazards than do the inorganic compounds of mercury because they can penetrate the bloodbrain barrier and the placenta very quickly. The primary toxic effects associated with exposure to the organic compounds of mercury are injuries to the central and peripheral nervous systems and to the kidneys (Casarett and Doull 1975/Ex. 1-1144). In addition, data concerning mouse and rat exposures to alkyl mercury compounds have demonstrated toxicity to the gastrointestinal system, pancreas, liver, gonads, and cardiovascular system. Suppression of the immune system and impairment of the endocrine system have also been observed (Shakbazyan, Shevchenko, Borisenko et al. 1977/Ex. 1-933). Fatalities in mice have been reported following exposures of 10 to 30 mg/m3 for 3 to 5 hours (Trakhtenberg 1950/Ex. 1-447).

Methyl mercury is among the most damaging of the alkyl compounds to humans because it accumulates in the body and causes developmental effects (Wilson 1977/Ex. 1–457). A three-month exposure to approximately 1 mg/m³

diethyl mercury caused death in two individuals (Hill 1943/Ex. 1-786). Another fatal case of alkyl mercury poisoning has also been described (Hook, Lundgren, and Swensson 1954/ Ex. 1-333). On the basis of his work with laboratory animals, Trakhtenberg (1950/ Ex. 1-447) stated that even a concentration as low as 0.00001 mg/m3 could not be tolerated by humans on a continuing basis. However, a later study reported no consistent, acute effects of mercury poisoning at air concentrations between 0.01 and 0.1 mg/m3, despite the fact that brief excursions considerably above this range occurred (Dinman. Evans, and Linch 1958/Ex. 1-311). Organic mercury compounds can be absorbed through the skin (Sax and Lewis 1989).

There is no sharp distinction between acute and chronic exposures to alkyl mercury compounds. The latency for effects associated with acute exposures may be as long as several weeks, while the latency for chronic effects may be several years. Symptoms associated with exposure to alkyl mercury include numbness and tingling of the lips and extremities, ataxia, hearing impairment, and emotional disturbances (Permanent Commission and International Association on Occupational Health 1969, pp. 897-898). In addition, severe ocular effects, including gross constriction of the visual field and blindness, have been reported among exposed humans (Hunter, Bomford, and Russell 1940). Severe intoxication can result in clonic seizures, incontinence, and periods of spasticity; less severe poisoning is associated with dizziness, excess salivation, lacrimation, and gastrointestinal disturbances. In addition, acute exposure to alkyl mercury causes eye, skin, and mucous membrane irritation, skin burns, and, occasionally, skin sensitization (Dales 1972; Proctor, Hughes, and Fischman 1988, pp. 310-311).

OSHA is retaining its 8-hour TWA PEL of 0.01 mg/m3 and its skin notation in construction and maritime. The Agency is proposing to add a 15-minute STEL of 0.03 mg/m3 for the alkyl compounds of mercury (measured as Hg) in the construction and maritime industries and to extend both of these limits to agriculture. The Agency preliminarily concludes that exposure to the alkyl mercury compounds poses significant risks of severe neuropathic and other systemic injuries, irritation and skin sensitization, all of which constitute material health impairments. OSHA believes that both the short-term and 8-hour limits are necessary to substantially reduce these risks. In

addition, promulgation of these limits will make OSHA's PELs for these substances consistent across all regulated sectors. METHYL ACETYLENE CAS: 74-99-7; Chemical Formula:

CH3CCH H.S. No. 2104

The current OSHA PEL for methyl acetylene in general industry, construction, and maritime is 1000 ppm as an 8-hour TWA. The Agency has no PEL for methyl acetylene in agriculture. The ACGIH has a TLV®-TWA of 1000 ppm and a TLV*-STEL of 1250 ppm for this substance. NIOSH has no REL for methyl acetylene but concurs with the PEL being proposed (Ex. 8-47, Table N3A). OSHA is proposing a PEL of 1000 ppm as an 8-hour TWA for methyl acetylene in agriculture. Promulgation of this limit will make the PEL for methyl acetylene consistent across all OSHAregulated sectors.

Methyl acetylene is a colorless, flammable gas with a sweet odor. It is used in organic synthesis, as a rocket propellant, and as a fuel for welding torches (Braker and Mossman 1980, p. 450; ACGIH 1986, p. 368). This gas is shipped in liquefied form and thus presents a cryogenic hazard to those

handling it.

In animals, methyl acetylene causes central nervous system effects and anesthesia at high concentrations. Rats exposed to a 42,000-ppm concentration initially became hyperactive and then exhibited lethargy and ataxia. The rats became completely anesthetized after 95 minutes of exposure to this concentration, but all rats survived such exposure for 5 hours and then recovered completely within 40 minutes of cessation of exposure. Examination of the lungs of rats at autopsy showed lung edema, alveolar hemorrhage, bronchiolitis, and pneumonitis (Horn, Weir, and Reese 1957). Dogs and rats exposed to a 28,700-ppm concentration of methyl acetylene became ataxic within minutes; dogs also exhibited staggering, excess salivation, and muscular fasciculations. Exposure to this concentration for 5 hours daily, 5 days per week for 6 months killed 40 percent of the rats (Horn, Weir, and Reese 1957).

There are no reports of adverse acute or chronic effects in humans exposed to methyl acetylene. Based on the effects noted in animals, however, methyl acetylene can be expected to depress the central nervous system and cause narcotic signs and symptoms in humans (Proctor, Hughes, and Fischman 1988, p. 317). Contact of the skin with liquefied

methyl acetylene can cause frostbite (Braker and Mossman 1980, p. 451).

Based on this evidence, OSHA is proposing a 1000-ppm 8-hour TWA limit to protect workers in agriculture from the significant risk of central nervous system effects caused by exposure to higher concentrations of methyl acetylene. The Agency preliminarily concludes that this limit is necessary to substantially reduce a significant risk of material health impairment in exposed workers. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

METHYLACRYLONITRILE CAS: 126-98-7; Chemical Formula: $CH_2 = C(CH_3)C = N$

H.S. No. 1251

In construction, maritime, and agriculture, OSHA has no PEL for methylacrylonitrile. The ACGIH recommends a 1-ppm TLV*-TWA and a skin notation to protect workers who are occupationally exposed to this substance. OSHA is proposing an 8-hour TWA permissible exposure limit of 1 ppm, with a skin notation, for methylacrylonitrile. NIOSH (Ex. 8-47. Table N1) has no REL but concurs that the proposed limit is appropriate. This limit and skin notation were recently established for methacrylonitrile in general industry.

Methylacrylonitrile (which is also called isopropene cyanide) is a colorless liquid that is used in the manufacture of plastic elastomers and coatings. This substance is also a chemical intermediate used to produce acids, amines, esters, nitriles, and amides.

Methylacrylonitrile is a chemical asphyxiant that is extremely toxic in animals, both by inhalation and dermal absorption. The LCoo in rats is 328 ppm for 4 hours, and the oral LDso in the same species is 120 mg/kg (RTECS 1990). The dermal LD50 in rabbits is 320 mg/kg (RTECS 1990). Acutely poisoned animals convulsed before death (RTECS 1990). Death is believed to be caused by the metabolism of the acrylonitrile to cyanide, which, in turn, reacts with cytochrome oxidase in mitochondria and inhibits cellular respiration (Peter and Bolt 1985). Beagles exposed for 90 days to 13.5 ppm convulsed and lost motor control in their hind limbs; at autopsy, microscopic brain lesions were detected in one of the dogs (ACGIH 1986/Ex. 1-3, p. 370).

Based on this evidence of methylacrylonitrile's acute toxicity. OSHA is proposing a 1-ppm 8-hour TWA PEL and a skin notation for methylacrylonitrile in construction, maritime, and agriculture. The Agency

preliminarily concludes that this limit and notation will substantially reduce the significant risk of material health impairment in the form of nervous system damage that is associated with this substance. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

METHYL BROMIDE

CAS: 74-83-9; Chemical Formula: CH₂Br H.S. No. 1253

OSHA's current PEL for methyl bromide in construction, shipyards, marine terminals, and longshoring operations is a 20-ppm ceiling with a skin notation; the ACGIH TLV®-TWA is 5 ppm, with a skin notation, NIOSH recommends that, based on its carcinogenicity, the REL for this substance be set at the lowest feasible level (Ex. 8-47, Table N6B). OSHA is proposing a permissible exposure limit of 5 ppm (8-hour TWA), with a skin notation, for methyl bromide; this is the limit recently established for this substance in general industry.

Methyl bromide is a colorless, nonflammable gas that has no taste and no odor at room temperature. At concentrations above 5 ppm, it has a sweetish odor. Methyl bromide was formerly used as a refrigerant and fire extinguishant, but these uses are now banned. Methyl bromide finds current use in industry in insect and rodent control and in soil fumigation (Farm Chemicals Handbook 1990, p. C192). Methyl bromide also is used as a methylating agent, to extract oils from nuts, seeds, and flowers, and to degrease wool (HSDB 1984). When used in pesticidal applications and in accordance with the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Methyl bromide has acute neurotoxic effects in both animals and humans and, at high concentrations, this substance causes pulmonary effects. The oral LDso in rats is 214 mg/kg, and the LCso in the same species is 302 ppm for 8 hours (RTECS 1990). Rabbits exposed to a 70ppm concentration of methyl bromide for 7 hours/day for 15 days showed signs of severe neurotoxicity, and many died (Skiov et al. 1981; Irish et al. 1940). Monkeys repeatedly exposed to a 65ppm concentration of methyl bromide convulsed, lost their equilibrium, and became paralyzed (Irish et al. 1940). In a 90-day bioassay, methyl bromide was administered to rats by gavage; it caused a statistically significant increase in the incidence of squamouscell carcinoma of the forestomach in

animals of both sexes (Danse et al. 1984).

Methyl bromide is a gas and thus primarily presents an inhalation hazard in industrial use, although there are suggestions that it can also be absorbed through the skin (Schifferli 1942). It is hypothesized that methyl bromide has a greater potential for toxicity than do other organic bromides because its greater lipophilicity provides increased access to the brain.

Various studies demonstrate methyl bromide's toxicity in humans. Ingram (1951/Ex. 1-175) reported ill effects (symptoms not specified) after exposure to methyl bromide at concentrations of 100 ppm. Similar exposure concentrations were also reported by Hine (1969/Ex. 1-70) in a case study of two date packers in California. Hine (1969/Ex. 1-70) also noted that methyl bromide has been responsible for more deaths among occupationally exposed pesticide workers in California than have the organophosphates. Johnson, Setzer, Lewis, and Anger (1977/Ex. 1-87) indicated that 34 packers became sick when exposed to an average methyl bromide concentration of 50 ppm; however, concentrations in the packing room may have been as high as 100 to 150 ppm during the purging of the fumigation chamber.

Watrous (1942/Ex. 1-275) described nausea, vomiting, and headache in 90 workers who were exposed for two weeks to concentrations "generally below" 35 ppm. Human fatalities caused by overexposure to methyl bromide have been estimated to occur at concentrations of 8000 ppm for a few hours and at concentrations as high as 60,000 ppm for 2 hours (Proctor, Hughes, and Fischman 1988, p. 322; RTECS 1990). Other authorities (Astley Clarke et al. 1945) believe that exposure to a 10,000 ppm concentration for more than a few minutes could be lethal.

In the prior rulemaking, NIOSH noted that methyl bromide is carcinogenic in animals and should be a candidate for a full Section 6(b) rulemaking (Ex. 8-47, Table N6B; Tr. pp. 3-97, 3-98). However, OSHA believes that the data to regulate methyl bromide as a carcinogen are incomplete at this time. Another commenter in the prior rulemaking (Ex. 116) urged OSHA to adopt a ceiling rather than 8-hour TWA limit for methyl bromide. OSHA believes that the proposed 5-ppm TWA will provide a substantial margin of safety against the methyl bromide exposures that have been shown to produce sickness in humans (generally in the 50- to 150-ppm

The presence of neurologic symptoms (nausea, headache, and vomiting) on

exposure to concentrations of methyl bromide below 35 ppm indicates that the current ceiling limit of 20 ppm is not adequate to protect workers from the effects of methyl bromide poisoning. Accordingly, OSHA is proposing a PEL of 5 ppm as an 8-hour TWA, with a skin notation, to protect construction, maritime, and agricultural workers more adequately against these incapacitating symptoms. The Agency preliminarily concludes that this limit will reduce this significant risk substantially. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. PENTABORANE

CAS: 19624-22-7; Chemical Formula: B₅H₉

H.S. No. 1304

In construction, shipyards, marine terminals, and longshoring, OSHA's current limit for pentaborane is 0.005 ppm as an 8-hour TWA. There is no PEL in agriculture. The ACGIH has the same 8-hour TLV®-TWA but also has a 15minute TLV*-STEL of 0.015 ppm. OSHA is retaining its 8-hour TWA permissible exposure limit of 0.005 ppm in construction and maritime, is proposing to add a 0.015-ppm 15-minute STEL in these sectors, and is also proposing to extend both limits to agriculture. NIOSH has no REL for this substance but concurs (Ex. 8-47, Table N1) that these limits are appropriate. These are the limits recently established for pentaborane in general industry.

Pentaborane is a colorless liquid with a strong and penetrating odor. Pentaborane is used as a rocket propellant (ACGIH 1986, p. 459).

In both humans and animals, inhalation of pentaborane vapor causes central nervous system effects (Svirbely 1954a/Ex. 1-385; Rozendaal 1951/Ex. 1-525; Lowe and Freeman 1957/Ex. 1-518; Cordasco, Cooper, Murphy, and Anderson 1962/Ex. 1-545). The 5-minute LC50s for rats and mice are 67 and 40 ppm, respectively; for 60-minute exposures, these values are 10 and 8 ppm, respectively (Weir, Seabaugh, Mershon, Burke, and Weeks 1964). Rats exposed repeatedly to a 3-ppm concentration of pentaborane exhibited tremors, hyperexcitability, belligerence, and weight loss (Svirbely 1954a/Ex. 1-385). Rats, rabbits, monkeys, and dogs exposed repeatedly to pentaborane vapor at concentrations of 1 ppm for four weeks or 0.2 ppm for six months lost weight (Levinskas, Paslian, and Bleckman 1958/Ex. 1-517). In the same experiments, rats and rabbits exposed at 1 ppm showed reduced activity and impaired locomotor ability, respectively, and monkeys and dogs exhibited

apathy, loss of appetite, insensitivity to pain, loss of mobility, tremor, and impaired coordination. The ACGIH (1986/Ex. 1-3, p. 459) notes that the 0.2ppm concentration reported in the Levinskas, Paslian, and Bleckman (1958/ Ex. 1-517) study was a calculated rather than measured value and that the actual exposure level in this study was probably closer to 0.01 ppm. Pentaborane is also believed to be rapidly absorbed through the skin in toxic amounts (Parmeggiani 1983, p. 318).

Humans accidentally overexposed to pentaborane have experienced tremors, convulsions, behavioral changes, loss of memory, impaired judgment, and other symptoms of central nervous system intoxication (Svirbely 1954a/Ex. 1-385: Rozendaal 1951/Ex. 1-525; Lowe and Freeman 1957/Ex. 1-518; Cordasco. Cooper, Murphy, and Anderson 1962/Ex. 1-545). The onset of symptoms may be delayed in humans for as long as 24 hours, and severe overexposure may cause death. A fatality occurred when a worker was severely overexposed both by inhalation and percutaneous absorption; the victim in this case convulsed and had severe opisthotonic spasms. Autopsy revealed necrotizing pneumonia in both lungs, fatty changes and centrilobular degeneration in the liver, and widespread degeneration of the brain (Yarbrough, Garrettson, Zolet et al. 1986). A worker in a nearby building at the time of the accident survived but experienced such severe nervous system injury that he had to be institutionalized (Yarbrough et al. 1986). Based on findings in animals, it is estimated that exposure to an 8-ppm concentration of pentaborane for 1 hour would cause slight toxicity in humans, while exposure to 30 ppm for the same interval would cause death (Proctor, Hughes, and Fischman 1988, p. 396).

Based on this evidence of pentaborane's extreme toxicity, OSHA is proposing to retain its 8-hour TWA PEL of 0.005 ppm in construction and maritime, to add a 15-minute STEL of 0.015 ppm for pentaborane in construction and maritime, and to extend both limits to agriculture. The Agency preliminarily concludes that these limits will protect workers in these sectors against the significant risk of central nervous system effects, such as tremors and convulsions, behavioral changes, and loss of judgment, potentially associated with exposure to pentaborane. OSHA preliminarily finds that these neuropathic effects constitute material health impairments within the meaning of the Act. In addition, promulgation of these limits will make

OSHA's PELs for this substance consistent across all regulated sectors. PHENYL MERCAPTAN CAS: 108-98-5; Chemical Formula: C₆H₅SH H.S. No. 1316

In construction, maritime, and agriculture, OSHA has no exposure limit for phenyl mercaptan. The ACGIH has a TLV*-TWA of 0.5 ppm, and NIOSH recommends a 15-minute ceiling limit of 0.1 ppm for phenyl mercaptan. OSHA is proposing a permissible exposure limit of 0.5 ppm as an 8-hour TWA for phenyl mercaptan in construction, maritime and agriculture. This is the limit recently established for this substance in general industry.

Phenyl mercaptan, also called benzenethiol, is a colorless liquid with an offensive, garlic-like odor. It is used as a chemical intermediate in the manufacture of pharmaceuticals, insecticides, fungicides, and other chemicals (HSDB 1985). When used in pesticidal applications and in accordance with the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

The primary acute hazards of exposure to phenyl mercaptan are central nervous system stimulation followed by post-convulsive CNS depression, severe eye and skin irritation, systemic toxicity to spleen, kidney, lung, and liver tissues, and narcotic effects (Fairchild and Stokinger 1958). This substance is highly toxic by inhalation, ingestion, and percutaneous absorption (Clayton and Clayton 1981, p. 2080).

Phenyl mercaptan has 4-hour inhalation LC50 values of 33 and 28 ppm in rats and mice, respectively (RTECS 1990), and the oral LD50 in rats is 46 mg/ kg (RTECS 1990; McCord and Witheridge 1949/Ex. 1-882). In rabbits and rats, dermal LD50 values are 134 mg/ kg and 300 mg/kg, respectively (RTECS 1990). The responses of acutely poisoned animals to phenyl mercaptan exposure were uniform regardless of species, and progressed from CNS stimulation to incoordination, skeletal and muscular paralysis, and respiratory depression, followed at high concentrations by coma and death. High doses (not further specified) administered via inhalation produced lung, liver, and kidney changes in mice (Doull and Plzak 1962; Fairchild and Stokinger 1958/Ex. 1-415): Schafer 1972/Ex. 1-362). In rabbits, phenyl mercaptan is a severe eye and skin irritant (McCord and Witheridge 1949/Ex. 1-882; Robles 1975; Schafer 1972/Ex. 1-362).

In humans, phenyl mercaptan is a moderately severe skin irritant and neurotoxin; it causes headaches and dizziness at unspecified levels (Fairchild and Stokinger 1958/Ex. 1-415; McCord and Witheridge 1949/Ex. 1-882). In the prior rulemaking, NIOSH (Ex. 8-47, Table N7; Tr. p. 3-99) stated that, in its opinion, the limit for phenyl mercaptan should be a ceiling rather than a timeweighted average. In response to NIOSH, OSHA stated that a TWA limit set at 0.5 ppm will ensure that workplace concentrations are consistently maintained at levels low enough to protect against phenyl mercaptan's acute toxic effects.

Based on this evidence of phenyl mercaptan's toxicity, OSHA is proposing an 8-hour TWA limit of 0.5 ppm. The Agency preliminarily concludes that this limit will protect construction, maritime, and agriculture workers from the significant risks of CNS effects, skin irritation, and systemic injury, all material impairments of health that are potentially associated with exposure to phenyl mercaptan at the uncontrolled levels permitted by the absence of an OSHA limit for this substance. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. PROPYLENE GLYCOL DINITRATE CAS: 6423-43-4; Chemical Formula:

C₃H₆N₂O₆ H.S. No. 1342

In construction, maritime, and agriculture, OSHA has no exposure limit for propylene glycol dinitrate (PGDN). The ACGIH recommends a TLV*-TWA of 0.05 ppm, with a skin notation. NIOSH has no REL for PGDN but concurs (Ex. 8–47, Table N1) with the limit OSHA is proposing, which is an 8-hour TWA PEL of 0.05 ppm. This is the limit recently established for this substance in general industry.

When freshly prepared, propylene glycol dinitrate is a colorless liquid with a disagreeable odor. It is used as a torpedo propellant (ACGIH 1986, p. 502).

Exposure to this substance affects blood pressure, causes methemoglobinemia, methemoglobinuria, and respiratory toxicity, injures liver and kidney tissues, and distorts vision in humans and animals. Propylene glycol dinitrate can also cause headache and incoordination, both indicators of nervous system effects.

The oral LD₅₀ value in rats is 250 mg/kg (RTECS 1990). In all species studied, death occurs by anoxia, which is caused by the almost complete conversion of hemoglobin to methemoglobin (Clark

and Litchfield 1969/Ex. 1-543). Ocular instillation of the liquid caused transient conjunctival redness (Jones, Strickland, and Siegel 1972/Ex. 1-742). Twenty-day skin exposures in rabbits at a 2-g/kg dose caused weakness and cyanosis; one of five rabbits died, and this animal's hemoglobin and hematocrit values had decreased. When the dose was increased to 4 g/kg, the rabbits' methemoglobin values rose to 34.5 percent by the time of death (Jones. Strickland, and Siegel 1972/Ex. 1-742). Continuous 90-day inhalation exposures to a 10-ppm concentration caused kidney and liver changes in dogs; exposures to 35 ppm caused heavy iron deposits in the liver, spleen, and kidneys. Female (but not male) rats showed a drop in blood pressure within 30 minutes after injection of PGDN doses above 5 mg/kg. Rhesus monkeys displayed mydriasis in 90-day exposures at 35 ppm but no change in avoidance behavior during a visual discrimination and acuity threshold test (Jones, Strickland, and Siegel 1972/Ex. 1-742).

In humans, eight-hour exposures to 0.2 ppm or higher concentrations of propylene glycol dinitrate resulted in visual distortion and headache (Stewart, Peterson, Newton et al. 1974). Although subjects developed a tolerance for the headache response, the visual effects of exposure were cumulative. Impaired balance occurred after 6.5 hours of exposure to a 0.5-ppm concentration, and a 40-minute exposure to 1.5 ppm caused eye irritation. Subjects exposed at 0.5 ppm for 8 hours experienced a consistent elevation in diastolic pressure but no pulmonary irritation. At concentrations of 0.03 to 1.5 ppm, no hematologic effects were observed (Stewart, Peterson, Newton et al. 1974). Studies of human exposures to levels below 0.1 ppm do not report chronic neurotoxicity (Horvath, Ilka, Boyd, and Markhan 1981/Ex. 1-557).

Based on this evidence in humans and animals, OSHA is proposing an 8-hour TWA limit of 0.05 ppm for propylene glycol dinitrate. The Agency preliminarily concludes that this limit will protect construction, maritime, and agricultural workers against the significant risks of hepatotoxic, hematologic, and central nervous system effects (all of which constitute material health impairments) that exist from workplace exposure at the levels currently permitted by the absence of an OSHA PEL. In addition, promulgation of these limits will make OSHA's PEL for this substance consistent across all regulated sectors.

Preliminary Conclusions. OSHA preliminarily concludes that significant

risks are associated with occupational exposure to the group of neuropathic toxicants shown in Table C1-1. The effects caused by such exposures include brain lesions, nausea, vomiting, general depression of the central nervous system, interference with sensory and motor functions, and alterations in the ability of the brain to process information. Affected workers may experience drowsiness, dizziness, loss of ability to concentrate, mood changes, reduced awareness, learning difficulties, unsteadiness, and auditory and visual disturbances. In addition, employees experiencing these effects are imperiled and are likely to hurt themselves or others in accidents caused by their reduced functional capacities. OSHA believes that

promulgation of the proposed exposure limits for these neurotoxins will substantially reduce such risks and afford protection to construction. maritime, and agricultural workers against these material health impairments. In addition, promulgation of these limits will make OSHA's PELs for these substances consistent across all regulated sectors.

2. Substances for Which Proposed Limits are Based on Avoidance of Narcotic Effects

Introduction. OSHA is proposing new or revised limits for 24 substances based primarily on evidence showing that occupational exposure to these substances causes narcosis. The narcotic effects of exposure to such

substances as the alcohols, aliphatic hydrocarbons, and chlorinated hydrocarbons have been recognized as serious for many years. Table C2-1 lists these chemicals, along with their CAS numbers, HS numbers, 1987-1988 ACGIH TLV*s, and NIOSH RELs. In addition, Table C2-1 shows OSHA's current permissible exposure limits (PELs) for these substances in construction, shipyards, marine terminals, and longshoring. OSHA has no PELs that apply to workers in agricultural workplaces. The right-hand column in Table C2-1 shows OSHA's current PELs for these substances in general industry; these are the limits being proposed today for construction. maritime, and agricultural workplaces.

TABLE C2-1, SUBSTANCES FOR WHICH PROPOSED LIMITS ARE BASED ON AVOIDANCE

H.S. No./chemical name	CAS No.	Current OSHA PEL in construction, shipyards, marine terminals, and longshoring*	1987-1988 ACGIH TLV ***	NIOSH REL ***	Proposed OSHA PEL in construction, maritime, and agriculture
1044 Butane	106-97-8		900 one TMA	United the second

1307 2-Pentanone (Methyl propyl ketone).	107-87-9	200 ppm TWA	200 ppm TWA, 250 ppm STEL	150 ppm TWA	200 ppm TWA, 250 ppm STEL.
1371 Stoddard solvent	8052-41-3	200 ppm TWA	100 ppm TWA	350 mg/m ^a TWA, 1800 mg/m ^a Ceiling	100 ppm TWA
1372 Styrene	100-42-5	100 ppm Ceiling	50 ppm TWA, 100 ppm STEL	(15-min). 50 ppm TWA, 100 ppm Ceiling (15-min).	50 ppm TWA, 100 ppm STEL
1397 Toluene	108-88-3	200 ppm TWA	100 ppm TWA, 150 ppm STEL	100 ppm 8-haur TWA, 200 ppm Ceiling (10-min).	100 ppm TWA, 150 ppm STEL
1406 Trichloroethylene	79-01-6	100 ppm TWA	50 ppm TWA, 200 ppm STEL	25 ppm TWA+	50 ppm TWA, 200 ppm STEL

^{*}OSHA's PELs do not currently apply in Agriculture; OSHA's TWA limits are for 8-hour exposures; its STELs are for 15 minutes unless otherwise specified; and its ceilings are peaks not to be exceeded for any period of time.

**The ACGIH TLV*-TWA is for an 8-hour exposure; its STELs are 15-minute limits not to be exceeded more than 4 times in any working day, with a minimum of 60 minutes between successive STEL exposures; and its ceilings are peaks not to be exceeded for any period of time.

***NIOSH TWA limits are for 10 hour/day, 40 hour/week exposures unless otherwise specified, and its ceilings are peaks not to be exceeded for any period of time unless a duration is specified in parentheses.

*NIOSH considers this substance a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration.

Description of the Health Effects. Narcosis is caused by a general depression of central nervous system (CNS) function. When the CNS becomes sufficiently depressed, the awareness or consciousness of affected persons is diminished. Initial symptoms of narcosis include drowsiness, difficulty in concentration, and mood changes; these effects may progress to slurred speech. dizziness, loss of coordination, and, in more severe cases, loss of consciousness, coma, and death. Except in more serious cases, CNS depression is reversible if exposure ceases. However, because narcosis adversely affects the concentration and coordination of affected workers, these workers and their co-workers are at increased risk of injuries and accidents caused by slowed reaction times, incoordination, and mistakes and errors in judgment.

The mechanism by which exposure to substances induces narcosis is poorly understood. It is believed that central nervous system depressants may have the same mechanism of action as general anesthetics, which appear to produce a reversible effect on electrically excitable neuronal

membranes.

Dose-Response Relationship and Narcotic Effects

The induction of narcosis following exposure to narcotic agents appears to follow the classical S-shaped (sigmoidal) dose-response relationship. As exposure level increases, both the percent of exposed persons affected and the severity of the effect increase. Although it is not known whether a true threshold exists for the occurrence of the molecular events leading to narcosis (i.e., disruption of electrical impulses in neurons), there is usually a level at which most exposed individuals will manifest the onset of symptoms associated with narcosis. The no-effect level for a particular substance is determined largely by individual susceptibility, the extent to which the material is absorbed, and the rate at which it is metabolized and eliminated.

The following discussions describe OSHA's preliminary findings for the substances in this group and illustrate the material health impairments potentially associated with workplace exposure to these central nervous system depressants.

BUTANE

H.S. No. 1044

In construction, shipyards, marine terminals, longshoring operations, and agriculture, OSHA has no limit for butane. The 1987-1988 ACGIH TLV*-TWA is 800 ppm; there is no NIOSH REL. OSHA is proposing an 8-hour TWA PEL of 800 ppm for butane in construction, maritime, and agriculture, and NIOSH (Ex. 8-47, Table N1) concurs that this limit is appropriate. This is the limit recently established for this substance in general industry.

Butane is used to calibrate pressure and temperature gauges and to fill the thermobulbs on these instruments. It also finds wide use as an intermediate in organic synthesis and in the manufacture of aviation, heating, and motor fuel (Braker and Mossman 1980, p. 89). The odor of butane is not detectable at airborne concentrations below 50,000 ppm (Braker and Mossman 1980, p. 89). Because butane is shipped as a liquefied gas under pressure, contact with the liquid form may cause frostbite.

The primary risk of exposure to butane is narcosis. In rats, the 4-hour LC50 is 658 g/m3, or about 280,000 ppm; in mice, this value is 680 g/m3 for 2 hours (NIOSH 1977i/Ex. 1-1182). n-Butane causes anesthesia in mice at airborne concentrations of 130,000 ppm after exposure for 25 minutes. This substance also is a relatively weak cardiac sensitizer in dogs (Reinhardt, Azar, Maxfield et al. 1971; Stoughton and Lamson 1936).

Humans exposed to a 1000-ppm concentration of butane for a single 8hour day or to a 500-ppm concentration for 2-week periods of 8-hour workdays showed no harmful subjective or abnormal physiological responses but did show a reduced visual evoked response (VER) wave amplitude during the second week (Stewart, Herrman, Baretta et al. 1977/Ex. 1-575). In contact with the eyes or skin, liquefied butane causes burns or frostbite (Clayton and Clayton 1981, p. 3182).

Based on this evidence, OSHA is proposing an 8-hour TWA permissible exposure limit (PEL) of 800 ppm for butane; this limit would apply to workplaces in construction, maritime, and agriculture. The Agency preliminarily concludes that this limit will protect workers in these sectors against the significant risks of

drowsiness, narcosis, and other central nervous system effects associated with

CAS: 106-97-8; Chemical Formula: C4H10 exposures at the uncontrolled levels permitted by the absence of an OSHA limit. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

> sec-BUTYL ALCOHOL CAS: 78-92-2; Chemical Formula: CH₃CH₂CHOHCH₃ H.S. No. 1049

OSHA's current limit for sec-butyl alcohol in construction, shipyards, marine terminals, and longshoring operations is 150 ppm as an 8-hour TWA. There is no PEL in agriculture. NIOSH has no REL for sec-butyl alcohol. The 1987-1988 ACGIH TLV®s for this substance are 100 ppm as an 8-hour TWA and 150 ppm as a 15-minute STEL. However, the ACGIH deleted the STEL for this substance in 1990 because there was no evidence that a STEL was needed; in OSHA's prior air contaminants rulemaking, the American Industrial Hygiene Association commented that no STEL was necessary to protect against sec-butyl alcohol's toxic effects (Ex. 8-16). After reviewing the available toxicologic evidence, OSHA agreed with this position (54 FR 2423), and the final rule for general industry (29 CFR 1910.1000, Table Z-1-A) thus contains only an 8-hour TWA PEL for this substance. Accordingly, OSHA is proposing an 8-hour TWA PEL of 100 ppm for sec-butyl alcohol in construction, maritime, and agriculture, and NIOSH concurs (Ex. 8-47, Table N1) that the proposed limit is appropriate. This is the limit recently established for this substance in general industry.

sec-Butyl alcohol is a colorless liquid with a strong, wine-like odor. It is used as a solvent for natural resins and linseed and cottonseed oils, and as a chemical intermediate. sec-Butyl alcohol is also an ingredient in a wide variety of commercial products, including polishes, flotation agents, flavors, perfumes, dyestuffs, wetting agents, paint removers, brake fluids, and industrial

cleaners (HSDB 1985).

sec-Butyl alcohol is a narcotic and irritant both in humans and animals. The oral LD50 in rats is 6480 mg/kg, and the lowest lethal concentration in the same species is 16,000 ppm for 4 hours (RTECS 1990). Mice exposed to secbutyl alcohol concentrations of 3300 to 19,800 ppm showed loss of coordination, prostration, and narcosis (Rowe and McCollister, in Clayton nd Clayton

1982, pp. 4582–4585). Liquid sec-butyl alcohol instilled into the eyes of rabbits caused severe corneal injury (Smyth, Carpenter, Weil, and Pozzani 1954).

Excessive exposure to sec-butyl alcohol is reported to have caused eye, nose, and throat irritation; headaches; nausea; fatigue; and dizziness in exposed humans (Rowe and McCollister, in Clayton and Clayton 1982, p. 4585). Workers exposed repeatedly to sec-butyl alcohol concentrations of 100 ppm, however, reportedly experienced no symptoms at this concentration (ACGIH 1986, p. 77/Ex. 1-3).

Based on this evidence in humans and animals, OSHA is proposing a PEL for sec-butyl alcohol in construction. maritime, and agriculture of 100 ppm as an 8-hour TWA. The Agency believes that this limit will afford workers in these sectors protection against the significant risks of narcosis and irritation that are associated with exposures to sec-butyl alcohol at concentrations above the proposed PEL. The Agency preliminarily concludes that the proposed limit will substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. tert-BUTYL ALCOHOL CAS: 75-65-0; Chemical Formula:

(CH₃)₃COH H.S. No. 1050

In construction, marine terminals. shipyards, and long-shoring operations, OSHA currently has a limit of 100 ppm as an 8-hour TWA for tert-butyl alcohol. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*-TWA for this substance is 100 ppm as an 8-hour TWA, with a TLV*-STEL of 150 ppm. NIOSH has no REL for tert-butyl alcohol but concurs (Ex. 8-47, Table N1) with the limits OSHA is proposing. OSHA is retaining the 100 ppm 8-hour TWA PEL in construction and maritime, is proposing 150 ppm as a 15-minute STEL in these two sectors, and is proposing both the PEL and the STEL in agriculture. These are the limits recently established for this substance in general industry.

At room temperature, tert-butyl alcohol is a colorless, crystalline solid with a camphor-like odor (ACGIH 1986/Ex. 1-3; HSDB 1985). tert-Butyl alcohol is an ingredient of perfumes, flavorings, flotation agents, cleaning compounds, paint removers, fruit essences, plastics, and lacquers. This substance is also used as an octane booster in gasoline, to extract water from substances, and in pharmaceutical production. In addition, tert-butyl alcohol is an intermediate in

the production of resins, artificial musk, and other substances (HSDB 1985). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Although similar to the other butyl alcohols in many respects, tert-butyl alcohol is more volatile and has a greater potential for narcotic effects than other butyl alcohols (Weese 1928/Ex. 1–1073). The oral LD₅₀ in rats is 3.5 g/kg (RTECS 1990). Acutely poisoned animals showed loss of coordination and other signs of narcosis (Schaffarzick and Brown 1952/Ex. 1–868). Repeated daily doses of tert-butyl alcohol that produced signs of narcosis were not fatal in experimental animals (Schaffarzick and Brown 1952/Ex. 1–868).

In humans, tert-butyl alcohol is known to cause slight redness and irritation when the liquid is applied to the skin (Oettel 1936). Exposure to concentrations described only as "excessive" is reported to have caused eye, nose, and throat irritation and narcotic symptoms, including headache, nausea, dizziness, and fatigue, in exposed workers (Schwartz and Tulipan, in Clayton and Clayton 1982, p. 4587).

Based on this evidence, OSHA is retaining the 8-hour TWA PEL of 100 ppm in construction and maritime. proposing to add a 15-minute STEL of 150 ppm in construction, maritime, and proposing to extend both PELs to agriculture. The Agency preliminarily concludes that this combination of limits will protect workers in these sectors against the significant risk of narcosis that is potentially associated with occupational exposures to this substance. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

CHLOROBROMOMETHANE CAS: 74-97-5; Chemical Formula: CH₂BrC1 H.S. No. 2034

OSHA's limit for chlorobromomethane in general industry, construction, and maritime is 200 ppm as an 8-hour time-weighted average (TWA). There is no limit in agriculture. The 1987–1988 ACGIH TLV*-TWA for chlorobromomethane is 200 ppm as an 8-hour TWA, and the TLV*-STEL is 250 ppm. There is no NIOSH REL for this substance, but NIOSH concurs (Ex. 8-47, Table N3A) with the limit being proposed. The Agency is retaining the current limit in construction and maritime and is

proposing an 8-hour TWA PEL of 200 ppm for chlorobromomethane in agriculture. This is the limit recently established for this substance in general industry.

Chlorobromomethane (also called methylene chlorobromide) is a colorless to pale yellow liquid that has a sweet, chloroform-like odor (ACGIH 1986, p. 125; Sittig 1985, p. 228). It is used as a fire extinguishing agent and as a chemical intermediate in organic synthesis (HSDB 1986; Clayton and Clayton 1982, p. 3455).

In both humans and animals, acute exposure to chlorobromo-methane causes irritation of the eyes, nose, and mucous mem-branes, and central nervous system depression (narcosis); in animals, chronic exposure causes lung. liver, and kidney damage. The oral LDso in rats is 5000 mg/kg (RTECS 1989). The lowest lethal concentration in rats is 28,800 ppm for 15 minutes (RTECS 1989). Acutely poisoned animals showed incoordination and narcosis before death; pulmonary edema and interstitial pneumonitis were also seen in these animals (Comstock, Fogelman, and Oberst 1953). Inhalation studies have shown that rats exposed to 3000 ppm of chlorobromomethane experienced light narcosis (Comstock, Fogelman, and Oberst 1953). In mice, fatty degeneration of the liver and kidneys occurred after a single dose of 3000 mg/kg was administered by stomach tube; however, a dose of 500 mg/kg caused no organ damage (Highman, Suirbely, von Oettingen et al. 1948). Transient corneal epithelial injury and conjunctival edema occurred in rabbit eves after the eves had been sprayed with a liquid mixture of chlorobromomethane (75%) and dichlorodifluoromethane (25%) from a fire extinguisher (Grant 1986, p. 210). Dermal testing in rabbits caused moderate irritation, hyperemia, and exfoliation of the skin (Rutstein 1963). Rats, rabbits, and dogs exposed 7 hours/ day, 5 days/week for 14 weeks to a 1000-ppm concentration of chlorobromomethane showed no signs of toxicity (Suirbely, Highman, Alford et al. 1947). Female rats and dogs exposed to a 500-ppm concentration of chlorobromomethane for 7 hours/day, 5 days/week for a period of 6 months showed some liver pathology at autopsy. Elevated blood bromide was the only observed effect in male rats, guinea pigs, and rabbits exposed to the same dose. Histopathological changes in the livers and testes as well as elevated blood bromide were observed in guinea pigs. rats, and rabbits when the concentration of chlorobromo-methane was increased

to 1000 ppm (Suirbely, Highman, Alford

et al. 1947).

Three firefighters exposed to very high but unknown vapor concentrations of chlorobromomethane experienced irritation of the eyes and throat. disorientation, headache, and nausea. Two of the victims later became comatose, one suffered convulsive seizures, and another required resuscitation following respiratory arrest; all recovered fully following supportive treatment (Rutstein 1963). An individual who was sprayed in the face by a fire extinguisher containing chlorobromomethane suffered from an immediate and severe burning sensation of the eyes. Medical examination of this individual revealed a partial loss of corneal epithelium and hyperemic and edematous conjunctivae and eyelids, but no permanent eye damage resulted from this exposure (Grant 1986, p. 210).

Based on the evidence presented above, OSHA preliminarily concludes that agricultural workers exposed to chlorobromomethane at the levels permitted by the absence of a limit are at significant risk of experiencing eye irritation and narcosis. The Agency believes that establishing a PEL of 200 ppm as an 8-hour TWA will protect workers in agriculture from these significant risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CUMENE

CAS: 98–82–8; Chemical Formula: $C_6H_5C_9H_7$ H.S. No. 2044

OSHA's current permissible exposure limit for cumene in general industry, construction, and maritime is 50 ppm as an 8-hour TWA; this limit also has a skin notation. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 50 ppm, with a skin notation, for cumene. NIOSH has no REL but concurs (Ex. 8-47, Table N3A) with the limit being proposed. OSHA is proposing to establish an 8-hour TWA PEL of 50 ppm, with a skin notation, for cumene in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all OSHAregulated sectors.

Cumene is a colorless liquid with a sharp, aromatic odor. This substance is used as a solvent and in the production of phenol, acetone, and alphamethylstyrene (ACGIH 1986, p. 151; Genium MSDS 1987, No. 395).

Cumene causes eye, nose, skin, and upper respiratory tract irritation in humans and animals; at high concentrations, it causes central nervous system depression in animals.

The oral LDto in rats is 1400 mg/kg, and the LCso in mice is 24,700 mg/m3 for 2 hours (RTECS 1987). The dermal LD50 in rabbits is 12,300 mg/kg (ACGIH 1986, p. 151; RTECS 1987). Rabbits showed mild eye irritation when 86 mg of cumene was instilled into their eyes, and a dermal dose of 10 mg caused mild skin irritation in rabbits (RTECS 1987). Fifty percent of mice exposed to 2040 ppm for 7 hours died; the signs and symptoms of acutely poisoned mice included dilation of cutaneous blood vessels, central nervous system depression, and respiratory depression (Werner, Dunn, and von Oettingen 1944). Repeated inhalation exposures to concentrations of 2000 ppm caused ataxia and lethargy in rabbits (Proctor, Hughes, and Fischman 1988, p. 166). At autopsy, rats exposed to 500 ppm cumene daily for 5 months had hyperemia and congestion of the lungs, liver, and kidneys (Fabre et al. 1955, in ACGIH 1986, p. 151).

In humans, exposure to a concentration of 200 ppm cumene caused nasal irritation and central nervous system effects (RTECS 1987). Inhalation of high (not further specified) vapor concentrations may cause dizziness, incoordination, and unconsciousness (Clayton and Clayton 1981, pp. 3309-3310). Liquid cumene can cause erythema and irritation when in contact with the skin, and repeated contact can cause dermatitis (Gerarde 1959; Genium MSDS 1987, No. 395). Of 102 workers exposed to cumene vapors, 48 percent showed increased bilirubin concentrations, alteration of enzymatic activity, changed lipid metabolism, altered liver and hepatobiliary function, and dyskinesia (Putalova 1979).

Based on this evidence in humans and animals, OSHA preliminarily concludes that cumene causes primary irritation and central nervous system depression in exposed workers. The Agency believes that, in the absence of a limit, workers in agriculture are at significant risk of experiencing these adverse health effects, which constitute material impairments of health. OSHA therefore believes that establishing a 50-ppm 8hour TWA limit, with a skin notation, is necessary to significantly reduce these risks among agricultural workers. Promulgation of this limit will also make OSHA's PEL for cumene consistent across all OSHA-regulated sectors. CYCLOPENTANE

CAS: 287-92-3; Chemical Formula: CH₂CH₂CH₂CH₂CH₂

H.S. No. 1111

OSHA has no limit for cyclopentane in construction, shipyards, marine terminals, longshoring operations, or agriculture. For workplaces in all of these sectors, OSHA is proposing a PEL of 600 ppm as an 8-hour TWA, which is consistent with the 1987–1988 ACGIH TLV® for this substance. NIOSH has no REL for cyclopentane but concurs with the proposed limit (Ex. 8–47, Table N1). This is the limit recently established for this substance in general industry.

Cyclopentane is a mobile, colorless, and flammable liquid. This substance occurs as an impurity in technical grade hexane, and it finds industrial use in the cracking of aromatics (Clayton and Clayton 1981, p. 3226). Cyclopentane also is an ingredient in a wide variety of commercial products, including analgesics, insecticides, antitumor agents, sedatives, and other pharmaceuticals (Clayton and Clayton 1981, p. 3226). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

The existing acute toxicity data in animals indicate that cyclopentane is a potent narcotic agent. Mice exposed to a 38-ppm concentration of cyclopentane exhibited loss of reflexes, and some exposed animals died (von Oettingen 1940). In experimental animals, there is no margin of safety between the minimal narcotic concentration and the lethal dose (von Oettingen 1940). Applied to the skin of guinea pigs, liquid cyclopentane causes slight redness and dryness (Brown and Bax 1971). Almost no data are available concerning the chronic effects of cyclopentane exposure.

Abbritti, Siracusa, Cianchetti, and coworkers (1976/Ex. 1-406) reported that petroleum solvents used in the Italian shoe industry contain up to 18 percent cyclopentane, and that workers exposed to these solvents have developed polyneuropathy. Oettel (1936/Ex. 1-921) reported that skin exposure to such solvents caused burning and skin blistering after 15 minutes of occluded contact. It has not been determined, however, whether the irritation was caused by cyclopentane or by cyclopentane and other substances, such as n-hexane, in the solvent.

Based on this evidence in humans and animals, OSHA is proposing a PEL of 600 ppm as an 8-hour TWA for cyclopentane in the construction, maritime, and agriculture industries. The Agency preliminarily concludes that occupational exposure to cyclopentane in these industries poses a significant risk of irritation and narcosis to exposed workers and that the proposed limit is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this

substance consistent across all regulated sectors. ETHYL ALCOHOL CAS: 64-17-5; Chemical Formula: CH, CH, OH H.S. No. 2076

OSHA's permissible exposure limit for ethyl alcohol in general industry, construction, and maritime is 1000 ppm as an 8-hour TWA; there is no limit in agriculture. The ACGIH has an 8-hour TLV®-TWA of 1000 ppm for ethyl alcohol. NIOSH has no REL for this substance but concurs with the PEL being proposed (Ex. 8-47, Table N3A). OSHA is proposing a PEL of 1000 ppm as an 8-hour TWA for ethyl alcohol in agriculture. Promulgation of this limit will make the PEL for ethyl alcohol consistent across all OSHA-regulated sectors

Ethyl alcohol is a clear, colorless, flammable liquid. It is a volatile liquid with a wine-like odor that is recognizable at a concentration of approximately 100 ppm (ACGIH 1986, p. 242.2; AIHA 1987, Table 5.1). Ethyl alcohol is used in alcoholic beverages. pharmaceuticals, perfumes, gasolines, antiseptics, synthetic rubber, paints, lacquers, explosives, antifreeze, cosmetics, and food flavorings. It is also used as a solvent, in organic synthesis, and in the manufacture of denatured alcohols. When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). Industrial ethyl alcohol contains denaturant ingredients to render it unfit or undesirable for human ingestion (HSDB 1989; Gosselin, Smith, and Hodge 1984, p. II-174; ACGIH 1986, p. 242.2).

Ethyl alcohol is an irritant of the eyes and mucous membranes in both animals and humans; exposure to high concentrations causes central nervous system depression. The oral LD50 in rats is 7060 mg/kg, the LCso in the same species is 20,000 ppm for 10 hours, and the lowest lethal dose in rabbits by dermal application is 20 g/kg (RTECS 1989). Rats exposed to a 22,800-ppm concentration of ethyl alcohol for 8 hours became deeply anesthetized, and exposure to a 16,000-ppm concentration for 8 hours caused some deaths in these animals. Incoordination was observed in rats exposed to 10,750 ppm for 2 hours: however, exposure to the same level for only 30 minutes caused no observable effects (Smyth 1956; Loewy and von der Heide 1918, in Clayton and Clayton 1982, p. 4545). In studies conducted on rabbits, ethyl alcohol produced mild to moderate irritation when in contact with the eyes or skin of these animals

(RTECS 1989). Administered to rats and mice by various routes (oral, inhalation, intraperitoneal, intravenous, intracerebral, intratesticular. intrauterine), ethyl alcohol causes fetotoxic, embryotoxic, teratogenic, and developmental effects in the offspring and reproductive effects in the parents (RTECS 1989).

Humans exposed to a 1000-ppm concentration of ethyl alcohol for an unspecified time exhibited mild signs of poisoning, while exposure to a 5000-ppm concentration for an unspecified time caused stupor and sleepiness (Browning 1956, in ACGIH 1986, p. 242.2). Transient irritation of the eyes, nose, and respiratory tract occurred in individuals exposed for brief periods to 5000 to 10,000 ppm concentrations of ethyl alcohol. Continuous coughing and lacrimation occur when humans are exposed to a 15,000-ppm concentration of ethyl alcohol; exposure to concentrations above 20,000 ppm were described as intolerable (Lester and Greenberg 1951; Rowe and McCollister, in Clayton and Clayton 1982, p. 4551).

Based on this evidence, OSHA is proposing a 1000-ppm 8-hour TWA limit to protect workers in agriculture from the significant risks of irritation and central nervous system depression potentially associated with exposure to ethyl alcohol. OSHA preliminarily concludes that this limit is necessary to substantially reduce a significant risk of material health impairment in exposed workers in this sector. In addition. promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. ETHYL BROMIDE

CAS: 74-96-4; Chemical Formula: C2H5Br

H.S. No. 1163

In construction, shipyards, marine terminals, and long-shoring operations. OSHA currently has an 8-hour TWA limit of 200 ppm for ethyl bromide. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*-TWA was 200 ppm, and the TLV*-STEL was 250 ppm. NIOSH has no REL for ethyl bromide. In construction and maritime, OSHA is retaining the 8-hour TWA PEL for ethyl bromide of 200 ppm and is proposing to add a 15-minute STEL of 250 ppm; the Agency is also proposing to extend both the 8-hour TWA and 15-minute STEL to agriculture. These are the limits recently established for these substances in general industry.

Ethyl bromide is a colorless, highly volatile, flammable liquid with an etherlike odor; it becomes yellow when exposed to light and air. Ethyl bromide was formerly used as an anesthetic

agent and is currently used as a grain and fruit fumigant, a chemical intermediate, a refrigerant, and an ethylating agent, particularly for gasoline (HSDB 1986). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

In addition to being a narcotic, ethyl bromide is an irritant of the respiratory system and a liver and kidney toxin. The oral LD50 in rats is 1350 mg/kg, and the lowest lethal concentration in rats is 26,980 ppm for 1 hour (RTECS 1990). When liquid ethyl bromide is applied to the skin of mice, it causes necrosis; instilled into rabbit eyes, it produces irritation (AIHA 1978). Skin absorption in toxic amounts is apparently possible, but no acute toxicity data exist for this route of exposure (Clayton and Clayton 1981, p. 3484). Prolonged exposure (6 months) to a 540-ppm concentration of ethyl bromide for 4 hours/day caused changes in liver function and liver damage that was visible at autopsy (Karimullina and Gizatullina, in Clayton and Clayton 1982, p. 3484). A National Toxicology Program carcinogenicity bioassay in rats and mice exposed by inhalation to 100 ppm (rats) or 200 ppm (mice) ethyl bromide for 6 hours/day for 2 years showed some evidence of carcinogenicity in rats (brain tumors) and clear evidence of carcinogenicity in female mice (uterine tumors) (NTP 1989).

Volunteers exposed to ethyl bromide concentrations of 6500 ppm for 5 minutes reported experiencing vertigo. headaches, and mild eye irritation (Sayers, Yant, Thomas, Berger 1929). Acute overexposure causes nervous system signs and symptoms that include redness of the face, dilation of the pupils, increased heart rate, cyanosis, and labored breathing. Several human deaths have been reported from the use of ethyl bromide as a general anesthetic (von Oettingen 1955/Ex. 1-876). These deaths were caused either by respiratory or cardiac arrest at the time the anesthetic was administered or by delayed effects on the heart, liver, or kidneys (von Oettingen 1955/Ex. 1-876).

In construction and maritime, OSHA is retaining its PEL of 200 ppm as an 8hour TWA and is proposing to add a 15minute STEL of 250 ppm for ethyl bromide; OSHA is also proposing to extend both limits to agriculture. The Agency preliminarily concludes that both limits are necessary to reduce the significant risks of narcosis, kidney and liver damage, and respiratory irritation that are potentially associated with occupational exposure to elevated levels of ethyl bromide in these sectors. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

ETHYL CHLORIDE

CAS: 75-00-3; Chemical Formula:

CH₃CH₂Cl

H.S. No. 2078

OSHA's PEL for ethyl chloride in general industry, construction, and maritime is 1000 ppm as an 8-hour TWA; there is no PEL in agriculture. The ACGIH has a TLV*-TWA for ethyl chloride of 1000 ppm; NIOSH considers this substance a carcinogen and recommends that it be handled with caution in the workplace. OSHA is proposing an 8-hour TWA PEL of 1000 ppm for ethyl chloride in agriculture. Promulgation of this limit will make the PEL for ethyl chloride consistent across all OSHA-regulated sectors.

Ethyl chloride is a colorless, flammable gas with an ethereal, slightly pungent odor. It is used as an anesthetic, a chemical intermediate, and sometimes as a refrigerant (Clayton and Clayton 1981, p. 3480; Braker and Mossman 1980,

p. 306).

Ethyl chloride causes central nervous system depression at high concentrations in both animals and humans; it is also a mucous membrane irritant and a liver and kidney toxin in laboratory animals. Ethyl chloride also can be absorbed through the skin and mucous membranes (Parmeggiani 1983, p. 1078; AIHA 1978). The LC50 for rats is 160 g/m3 for 2 hours (RTECS 1987). Exposure to a 23- or 24-percent concentration of ethyl chloride (230,000 or 240,000 ppm) caused guinea pigs to lose consciousness in 5 to 10 minutes; some of the animals died from this exposure. However, all guinea pigs survived a 30-minute exposure to a 9.1percent (91,000 ppm) concentration of ethyl chloride, although histopathological changes were noted in the lungs, liver, and kidneys of these animals at autopsy (Sayers, Yant, and Thomas 1929). In guinea pigs exposed to a 40,000-ppm concentration of ethyl chloride, incoordination was seen after 3 minutes; after 40 minutes of exposure, these animals showed signs of eve irritation and were unable to stand. Although all animals survived 4.5 hours of exposure to this concentration, death occurred in some animals after 9 hours. At autopsy, pathological changes were seen in the liver, lungs, and kidneys (Sayers, Yant, and Thomas 1929). Animals exposed for prolonged periods to ethyl chloride concentrations that cause narcosis demonstrate a fall in blood pressure, irregularity in breathing, and damage to the liver, heart, and lungs (von Oettingen 1955, 1964). A recent study involving mice exposed continuously for 11 days to 250, 1250, or 5000 ppm ethyl chloride showed that the only treatment-related effects in these animals were an increase in relative liver weight and size and a slight increase in hepatocellular vacuolization (Landry, Johnson, Phillips, Weiss 1989).

In humans, exposure to a 13,600-ppm concentration of ethyl chloride caused signs of mild intoxication after 17 minutes; at a 25,000-ppm concentration. incoordination developed. At a concentration of 33,600 ppm, exposed individuals became intoxicated within 30 seconds of exposure and lost coordination after 5 minutes (Sayers, Yant, Thomas, and Berger 1929). Liquefied ethyl chloride spilled on the skin or splashed into the eyes may cause frostbite (AIHA 1978). Two persons are reported to have developed acute allergic eczematous dermatitis after ethyl chloride was sprayed on their skin in an allergy test (van Ketel 1976).

Based on this evidence, OSHA preliminarily concludes that workers in agriculture who are potentially exposed to ethyl chloride at the levels permitted by the absence of a limit are at significant risk of experiencing narcosis and other exposure-related effects. The Agency believes that establishing an 8-hour TWA PEL of 1000 ppm will substantially reduce the risk of these material impairments of health. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. GASOLINE

CAS: 8006-61-9; Chemical Formula: None

H.S. No. 1185

In construction, maritime, and agriculture, OSHA has no PEL for gasoline. The 1987–1988 ACGIH TLV*s for this substance are 300 ppm as an 8-hour TWA and 500 ppm as a 15-minute STEL. NIOSH has no REL for gasoline. OSHA is proposing an 8-hour TWA PEL of 300 ppm and a 15-minute STEL of 500 ppm for this substance in these sectors. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

Gasoline is a clear, flammable, volatile liquid with a characteristic odor; it is used as an engine fuel. Gasoline is a complex mixture of at least 250 hydrocarbons (ACGIH 1986, p. 263; Page and Mehlman 1989, p. 869).

In addition to narcosis, exposure to gasoline has been associated with irritation of the eyes and upper respiratory tract, liver and kidney damage, and, in animals, cancer of the liver and kidney (Page and Mehlman 1989). The LC₅₀ in rats is 300 g/m³ for 5 minutes (RTECS 1990). Splashed into the eyes of rabbits, gasoline causes transient corneal injury and blepharospasm (Grant 1986, p. 714). A two-year carcinogenicity bioassay (inhalation) in mice and rats revealed that exposure of these animals to concentrations of gasoline vapors caused increased incidences of renal tumors in male rats and of liver tumors in female mice (Page and Mehlman 1989; EPA 1987).

Volunteers exposed to vapor concentrations of 500 to 900 ppm for 1 hour became dizzy and, at 900 ppm, five of six volunteers reported experiencing eye irritation (Drinker, Yaglou, and Warren 1943). At the 160 to 270 ppm level, these volunteers experienced eye and upper respiratory tract irritation after 8 hours of exposure (Drinker, Yaglou, and Warren 1943). A later study by Davis, Schafer, and Bell confirmed the eye irritation effects of exposure to gasoline vapor from three different unleaded gasoline samples (Davis, Schafer, and Bell 1960). Results of epidemiologic studies in humans exposed to gasoline vapors at service stations, refineries, and distribution terminals have generally been inconclusive; most studies have failed to demonstrate an increase in cancer risk in these populations (EPA 1987; Page and Mehlman 1989).

OSHA is proposing an 8-hour TWA PEL of 300 ppm and a 15-minute STEL of 500 ppm for this substance in these sectors. These are the final limits recently established for gasoline in

general industry.

However, as OSHA indicated in its brief submitted to the U.S. Court of Appeals for the Eleventh Circuit in the pending case AFL v. OSHA, Nos. 89–7185, et al., OSHA also notes ACGIH's finding that eye and throat irritation may occur in workers exposed at concentrations of 160 to 270 ppm (54 FR 2424/2).

After the close of the record of the general industry rulemaking, the American Petroleum Institute (API) submitted to OSHA a journal article published by McDermott and Killiany (1978) stating that the vapor that produced eye and throat irritation in the range of 160 to 270 ppm was not of the same hydrocarbon content as the vapor typically encountered in occupational exposure scenarios. However, this same paper recommends a TLV* of 300 ppm based on the use of the mixtures equation to calculate the TLV® However, if benzene's contribution to the toxicity of gasoline is considered,

McDermott and Killiany (1978), the resulting TLV* would be approximately 100 ppm (using a 1 ppm benzene TLV*).

In its brief, OSHA stated "that, because eye and throat irritation may well constitute a material impairment of health, the evidence of gasoline's irritation effects at levels below 300 ppm warrants further study in the next PEL update." OSHA will consider whether the evidence does or does not support a lower PEL in the next PEL update and that decision will cover all segments of industry. OSHA does not intend to resolve that issue in this rulemaking because the Agency's priority in this rulemaking is to extend the updated general industry PELs to all other industry segments. OSHA believes that attempting to resolve the irritation issue and complex issues in this rulemaking would make this rulemaking difficult to complete in a timely fashion.

HEPTANE

CAS: 142-82-5; Chemical Formula: CH3(CH2)5CH3 H.S. No. 1194

The current OSHA limit for heptane in construction, shipyards, marine terminals, and longshoring operations is 500 ppm as an 8-hour TWA. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*s for heptane are 400 ppm as an 8-hour TWA and 500 ppm as a 15minute STEL. The NIOSH REL for heptane is 85 ppm as a 10-hour TWA or 440 ppm as a 15-minute limit. OSHA is proposing an 8-hour TWA PEL of 400 ppm and a 15-minute STEL of 500 ppm. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

Heptane is a clear, flammable liquid that is highly volatile. This substance is used as a solvent, a chemical intermediate, a standard for octane rating determinations, and a research

chemical (HSDB 1986).

Heptane is a central nervous system depressant in both humans and animals. The intravenous LD50 in mice is 222 mg/ kg (RTECS 1990). Three of four mice died after a 3-to-4 minute exposure to a 48,000-ppm concentration of n-heptane (Proctor, Hughes, and Fischman 1988, p. 269). Rats were given 1 ml/kg heptane daily for 2 days or daily for 7 days or twice weekly for 45 days, after which their livers were homogenized and assayed. The function of specific liver enzyme systems in the livers of rats exposed for 7 or 45 days was significantly impaired (Goel, Rao, and Pandya 1982).

The American Industrial Hygiene Association (1959) reports that exposure to a 1000-ppm concentration of heptane

for 6 minutes caused slight dizziness in human volunteers; exposure to higher concentrations (5000 ppm) caused vertigo, in coordination, inappropriate behavior, loss of appetite, and nausea. When heptane is applied to the skin, it causes immediate irritation: blisters occurred in the affected area 5 hours after contact (NIOSH Criteria Document

As discussed below in connection with pentane and the hexane isomers, the NIOSH REL is the same for all of the C₅-C₈ alkanes (i.e., 350 mg/m³ (85 ppm) as a 10-hour TWA and 1800 mg/m3 (440 ppm) as a 15-minute ceiling). These RELs are based on NIOSH's belief that all Co-Co alkanes possess a potential neurotoxic capability similar to that of n-hexane. OSHA disagrees with NIOSH on this point, believing instead that the neurotoxicity caused by exposure to nhexane results from the action of a unique metabolite, 2,5-hexanedione. In the prior rulemaking, the majority of record commenters agreed with OSHA that n-hexane is uniquely neurotoxic (Exs. 3-593, 3-896, and 3-1246). A recent study (Perebelli, Brugnone, Coches, De Rosa, and Bartolucci (1986) confirms that, both in rats and occupationally exposed workers, the principal metabolites are 2-heptanol, 3-heptanol, 2-heptanone, 4-heptanone, and 2,5heptanedione.

The Agency is aware that heptane is more acutely toxic than hexane and concludes preliminarily that it is appropriate to reduce the limit for heptane to a level below the level being proposed for the hexane isomers (i.e., 500 ppm as an 8-hour TWA and 1000 ppm as a 15-minute STEL). Therefore, in construction, maritime, and agriculture, OSHA is proposing for heptane a 400ppm PEL as an 8-hour TWA and 500ppm as a 15-minute STEL. The Agency believes that the proposed TWA and STEL will substantially reduce the significant occupational risks of heptane-related narcosis in construction, maritime, and agricultural workplaces. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

HEXANE ISOMERS (OTHER THAN N-HEXANE) CAS: None; Chemical Formula:

 $(CH_3)_3C_3H_5$; $n(CH_3)_4C_2H_2$

H.S. No. 1201

OSHA has no limit in construction, maritime, or agriculture for the hexane isomers. The 1987-1988 ACGIH TLVs® for the hexane isomers are 500 ppm as an 8-hour TWA and 1000 ppm as a 15minute STEL. NIOSH has a recommended TWA limit for these

isomers of 100 ppm, supplemented by a 510-ppm 15-minute ceiling. OSHA is proposing an 8-hour TWA PEL of 500 ppm and a 15-minute STEL of 1000 ppm for the hexane isomers (other than nhexane) in construction, maritime, and agriculture. These are the limits recently established for these substances in general industry.

The hexanes are clear, highly volatile liquids that have a mild gasoline-like odor. Their principal uses are in solvents for oils, glues, paints, and coatings and as constituents of rubber solvents and petroleum ether. The hexanes also find use as chemical intermediates and as gasoline additives (ACGIH 1986, p. 107).

Mice exposed to a 30,000-ppm concentration of hexane for 30 to 60 minutes became narcotized, and death occurred when the concentration was increased to 35,000 or 40,000 ppm (Flury and Zernik 1931; Swann et al. 1974).

These isomers are known to be irritants of the eyes, skin, and respiratory tract as well as central nervous system depressants. Prolonged or repeated contact of the skin with liquids containing hexane produces redness, swelling, and dermatitis (Genium MSDS 1989). A study by Drinker, Yaglou, and Warren (1943/Ex. 1-730) shows that humans exposed to 1400 to 1500 ppm of hexane experienced nausea and headache. Patty and Yant (1929) found that a 10-minute exposure to a 5000-ppm concentration caused giddiness and dizziness in exposed subjects. A study by Nelson, Enge, Ross et al. (1943/Ex. 1-66) showed no effects in unacclimated subjects exposed to hexane isomers in concentrations of 500 ppm, but narcotic effects have often been seen in subjects exposed at levels above 1000 ppm (Elkins 1959d, as cited in ACGIH 1986, Ex. 1-3, p. 307). The ACGIH based its limit primarily on the Nelson, Enge, Ross et al. (1943/Ex. 1-66) study.

NIOSH recommends limits for the hexane isomers of 100 ppm as a 10-hour TWA and 510 ppm as a 15-minute shortterm limit. These recommendations are based on human and animal evidence showing that exposure to n-hexane, one of the hexane isomers, at concentrations below 500 ppm is associated with the development of polyneuropathy (Inoue, Takeuchi, Takeuchi et al. 1970/Ex. 1-75; Miyagaki 1967/Ex. 1-198). Thus, the NIOSH REL does not distinguish between n-hexane and the other hexane isomers; instead, NIOSH (Ex. 1-233) concluded that all of the Cs-Cs alkanes are potential neuropathic agents and should have the same exposure limit.

In the prior rulemaking, OSHA disagreed with NIOSH's view; OSHA does not believe that all Cs-Cs alkanes are potential neuropathic agents. Instead, OSHA is persuaded that 2,5hexanedione, a metabolite of n-hexane (but not of the other hexane isomers) is responsible for the unique neurotoxic properties of n-hexane. OSHA's view thus agrees with that of the ACGIH, which states that "it seems unlikely that all the hexanes would follow the same metabolic route in the body [as nhexanel, in view of the marked variations in structure of the molecule" (ACGIH 1986/Ex. 1-3, p. 307). The majority of commenters in OSHA's prior air contaminants rulemaking supported OSHA's conclusion in that rulemaking that n-hexane is uniquely toxic because of the presence of 2,5-hexanedione and that the other alkanes are not toxic in this way (Exs. 3-593, 3-896, and 3-1246).

Based on the evidence discussed above, OSHA is proposing PELs of 500 ppm (8-hour TWA) and 1000 ppm (15minute STEL) for the hexane isomers in construction, maritime, and agriculture. OSHA preliminarily finds that workers exposed to the hexane isomers in these sectors are at significant risk of experiencing narcosis and of developing neuropathy at exposure levels above those proposed. The Agency believes that establishing the proposed limits will substantially reduce these occupational risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

ISOAMYL ALCOHOL (PRIMARY AND SECONDARY)

CAS: 123–51–3; Chemical Formula: (CH₃)₂CHCH₂CH₂OH—Primary; (C₂H₅)₂CHOH—Secondary H.S. No. 1218

In construction, shipyards, marine terminals, and long-shoring operations, OSHA's limit for the isoamyl alcohols is 100 ppm as an 8-hour TWA. There is no PEL in agriculture. The 1987-1988 ACGIH limits are an 8-hour TLV®-TWA of 100 ppm and a 15-minute TLV*-STEL of 125 ppm for the primary and secondary isoamyl alcohols. NIOSH has no REL but concurs (Ex. 8-47, Table N1) with the proposed limits. In construction, maritime, and agriculture, OSHA is retaining the Agency's 8-hour TWA limit of 100 ppm, proposing to add a 125-ppm 15-minute STEL, and proposing to extend both limits to agriculture.

Isoamyl alcohol is a flavoring agent, a lubricating and hydraulic oil additive, and a chemical intermediate. This substance also finds wide use as a solvent for fats, oils, and alkaloids (HSDB 1986). Isoamyl alcohols are colorless liquids with alcohol-like odors.

In rats, the oral LD50 for the primary isoamyl alcohol is 1300 mg/kg; the dermal LD50 in rabbits is 3212 mg/kg (RTECS 1990). Applied to the skin or eyes of rabbits, isoamyl alcohol causes minimal to severe irritation (Rowe and McCollister, in Clayton and Clayton 1982, pp. 4594-4599). Rats exposed to a 2000-ppm concentration for 8 hours survived, and rabbits administered 0.7 g/kg isoamyl alcohol orally developed stupor and lost control of voluntary movement (Munch 1972). By oral and subcutaneous administration, isoamyl alcohol caused malignant tumors of the liver and blood in rats (RTECS 1990; Gibel, Lohs, and Wildner 1975).

Smyth (1956/Ex. 1–759) reported that the principal effect of inhalation exposure to this substance in humans is narcosis. Nelson, Enge, Ross, and coworkers (1943/Ex. 1–66) reported that unacclimatized human volunteers reported upper respiratory tract irritation after brief (3- to 5-minute) exposures to an isoamyl alcohol concentration of 100 ppm and objectionable eye and mucous membrane irritation after short-term

exposures to 150 ppm.

Based on this evidence, OSHA is retaining the 8-hour TWA PEL of 100 ppm and proposing to add a 15-minute STEL of 125 ppm for the isoamyl alcohols (primary and secondary) in construction and maritime; the Agency is also proposing to extend both limits to agriculture. OSHA preliminarily concludes that these limits are necessary to reduce the significant risk of eye irritation and narcotic effects associated with exposure to these substances. In addition, promulgation of these limits will make OSHA's PELs for these substances consistent across all regulated sectors.

ISOPHORONE

CAS: 78-59-1; Chemical Formula: C₉H₁₄O

H.S. No. 1221

In construction, shipyards, marine terminals, and long-shoring, the Agency's current limit for isophorone is 25 ppm as an 8-hour TWA. There is no PEL in agriculture. The ACGIH has established a 5-ppm TLV® as a ceiling limit, and NIOSH recommends a workplace standard of 4 ppm as a 10-hour TWA and concurs (Ex. 8-47, Table N1) with OSHA's proposed limit which is 4 ppm as an 8-hour TWA. This is the limit recently established for this substance in general industry.

Isophorone is a colorless liquid at room temperature, and it has a camphorlike odor. This substance is used as a

solvent for lacquers, plastics, oils, fats, gums, resin systems, nitrocellulose, and vinyl-resin copolymers and as a chemical intermediate. It also finds use in the manufacture of pesticides (HSDB 1986).

Studies in animals and with human volunteers indicate that exposures to high concentrations of isophorone cause narcotic, nephrotoxic, and irritant effects. The oral LDso in rats is 2330 mg/ kg, and the LC50 in the same species is 1840 ppm for 4 hours (RTECS 1990). The dermal LD50 in rabbits is 1500 mg/kg (RTECS 1990). Applied to the skin of rabbits, isophorone causes mild irritation; in the eyes, however, this substance causes severe irritation (RTECS 1990). A paper by Smyth, Seaton, and Fischer (1942/Ex. 1-378) reported that guinea pigs and rats exposed to 550 ppm isophorone for 6 weeks exhibited degenerative changes in the kidneys and liver at autopsy. At an exposure level of 25 ppm, no adverse effects were noted, but at 50 ppm, the liver of one animal and the kidneys of four others were damaged. The entire group of 20 animals exposed to a 50-ppm concentration survived, but two of 16 animals died after this concentration was raised to 100 ppm (Smyth, Seaton, and Fischer 1942/Ex. 1-378). A 2-year bioassay for carcinogenicity involving the administration by gavage of 250 or 500 mg/kg isophorone showed a doserelated and statistically significant increase in kidney and preputial gland tumors in male rats and an increase in the incidence of liver tumors in male mice in the high-dose group (Bucher, Huff, and Kluwe 1986).

Human volunteers exposed for a few minutes to isophorone vapor at concentrations between 40 and 400 ppm experienced eye, nose, and throat irritation; several subjects exposed at the 200-ppm level reported headache, nausea, faintness, dizziness, and a feeling of suffocation (Smyth and Seaton 1940a/Ex. 1-377). Silverman, Schulte, and First (1946/Ex. 1-142) reported that volunteers exposed to a 25-ppm concentration of isophorone, the current OSHA PEL in construction and maritime, complained of irritation of the eyes, nose, and throat. Workers exposed for a 1-month period to levels of 5 to 8 ppm isophorone demonstrated fatigue and malaise; however, when the workplace level was reduced to between 1 and 4 ppm, there were no complaints of adverse effects (NIOSH Criteria Document 1978).

Based on this evidence in humans and animals, OSHA is proposing in construction and maritime to reduce its 8-hour TWA PEL of 25 ppm to an 8-hour TWA PEL of 4 ppm, and to extend this limit to agriculture, to protect workers in these sectors against the significant risk of fatigue, nausea, and headaches that have been demonstrated to occur at isophorone levels of between 5 and 8 ppm. The Agency preliminarily concludes that the proposed limit will substantially reduce these occupational risks for workers in these sectors. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

METHYL CHLORIDE

CAS: 74–87–3; CHEMICAL FORMULA: CH₃Cl

H.S. No. 1254

In construction, marine terminals, shipyards, and long-shoring, OSHA's current limit for methyl chloride is 100 ppm as a ceiling. There is no PEL in agriculture. The ACGIH has a 50-ppm 8hour TLV*-TWA limit and a 100-ppm TLV*-STEL for this substance, and NIOSH recommends the lowest feasible limit because it considers methyl chloride a potential occupational carcinogen. The PELs being proposed by OSHA for construction, maritime, and agricultural workplaces are 50 ppm as an 8-hour TWA and 100 ppm as a 15-minute STEL. These are the limits recently established for these substances in general industry.

Methyl chloride (also called chloromethane) is a colorless, sweetsmelling gas. This substance is used as a methylating agent in the manufacture of a wide variety of substances and as a blowing agent in polystyrene foam production (ACGIH 1986, p. 380). Formerly, methyl chloride found wide use as a refrigerant (Grant 1986, p. 612). Methyl chloride also is used as an antiknock fuel additive and an ingredient of fungicides and pesticides (Proctor, Hughes, and Fischman 1988, p. 325). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

There is considerable evidence in animals demonstrating that exposure to methyl chloride produces narcosis and other central nervous system effects and causes kidney and liver damage, and that this substance is a teratogen, reproductive toxin, and carcinogen. The LCso in rats is 5300 mg/m3 for 4 hours (RTECS 1990). Acutely poisoned animals showed the following signs of narcosis: apathy, staggering gait, drowsiness, hind-limb paralysis, spasticity, and convulsions (IARC 1986, Vol. 41, p. 170). At autopsy, kidney damage and hemorrhage of the lung were seen (IARC 1986, Vol. 41, p. 170). Rats exposed to a

3500-ppm concentration for 6 hours/day for as many as 12 days developed diarrhea, forelimb incoordination, hindlimb paralysis, and convulsions (Morgan et al. 1982). Mice exposed continuously or intermittently over the same period to 400 ppm showed brain lesions at autopsy (Landry, Quast, Gushow, and Mattsson 1985). Adverse kidney and blood effects were seen in mice exposed for up to 9 days to a 2400-ppm concentration of methyl chloride (Landry et al. 1985). By inhalation, methyl chloride has caused fetal growth retardation and impaired male reproductive capacity in rats and heart defects in the offspring of exposed mice (IARC 1986, p. 176; RTECS 1990). Male mice repeatedly exposed to a 1000-ppm concentration of methyl chloride over a 2-year period had a statistically significant increase in the incidence of tumors of the kidney (NIOSH CIB 1984).

Methyl chloride has caused death in several cases of human poisoning; these fatalities have occurred both as a result of high acute exposures and of long-term exposures to lower concentrations (Scharnweber, Spears, and Cowles 1974/Ex. 1-664). Victims of methyl chloride poisoning display the following signs of narcosis before death: staggering gait, slurred speech. drowsiness, weakness, and paralysis; convulsions, cyanosis, and coma also occur (Scharnweber, Spears, and Cowles 1974/Ex. 1-664; Spevak, Nadj. and Felle 1976; Hansen, Weaver, and Venable 1953). Survivors of near-lethal exposures may evidence mild neurologic or psychiatric effects for as long as 13 years after the incident (Gudmundsson

The Dow Chemical Company (as cited in ACGIH 1986/Ex. 1-3, p. 380) studied the methyl chloride exposures of employees in 54 job classifications over a 4-month period. Exposures ranged from 5 to 78 ppm methyl chloride (8-hour TWAs), averaged 30 ppm over the work shift, and occasionally included peaks as high as 440 ppm. Medical examination of these workers revealed no detectable effects of methyl chloride exposure. However, average 8-hour exposures in the range of 195 to 475 ppm caused symptoms of weakness, drowsiness, staggering gait, thickness of the tongue, and memory lapses in some of the exposed employees [Dow Chemical Company, as cited in ACGIH 1986/Ex. 1-3, p. 380). Repko and coworkers (1976/Ex. 1-1165) found that workers exposed to concentrations of methyl chloride ranging from 7.4 to 70 ppm but averaging 33.6 ppm displayed a significant performance decrement, and that exposures below 100 ppm produced

significant but transitory changes in functional capacity.

In the prior air contaminants rulemaking, NIOSH stated that it believes that methyl chloride is an appropriate substance for a Section 6(b) rulemaking because, according to NIOSH criteria, methyl chloride is a potential occupational carcinogen (Ex. 8-47; Tr. 3, pp. 97-98). However, OSHA notes the inconclusive nature of the evidence of methyl chloride's carcinogenicity and the fact that the International Agency for Research on Cancer (IARC) has concluded that this evidence is inadequate in both humans and animals (IARC 1986, p. 177). The only study in humans, an assessment of cancer risk in a small group of butyl rubber workers, was, in IARC's words. "uninformative with regard to the carcinogenic hazard of this chemical" (IARC 1986, p. 176).

Results of the two studies evaluating neurological effects are less than definitive as to LOEL for these effects. In the Dow study, medical examination of workers exposed to 5 to 78 ppm TWAs revealed no effects, although some workers exposed to 195 to 475 ppm (8-hour TWAs) complained of symptoms such as weakness, drowsiness, and memory loss. Repko reported significant performance decrement in workers exposed to concentrations between 7 and 70 ppm.

OSHA will continue to monitor the literature and determine whether to reevaluate the level for methyl chloride in the first PEL update. At that time, a level for all industry sectors will be considered at the same time. Currently, OSHA is proposing the same level in construction, maritime, and agriculture that was recently established for general industry.

Accordingly, OSHA is proposing to establish an 8-hour TWA PEL of 50 ppm and a 15-minute STEL of 100 ppm for methyl chloride in construction, maritime, and agriculture. The Agency preliminarily concludes that these limits will substantially reduce the significant risk of narcotic effects, including functional impairment, performance decrements, headaches, dizziness, slurred speech, and staggering gait that have been associated with occupational exposure to this substance. In addition. promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

METHYL CHLOROFORM (1,1,1-TRICHLOROETHANE) CAS: 71-55-6; Chemical Formula: CH₃CCl₃ H.S. No. 1255

OSHA currently has an 8-hour TWA limit of 350 ppm for methyl chloroform in construction, shipyards, marine terminals, and longshoring operations. There is no PEL in agriculture. The 1987-1988 ACCIH TLV®-TWA was 350 ppm and the TLV*-STEL was 450 ppm for this substance; NIOSH recommends a 15-minute ceiling limit of 350 ppm. In construction and maritime, the Agency is retaining its 8-hour TWA limit and is proposing to add a STEL of 450 ppm; OSHA is also proposing to extend both limits to agriculture. NIOSH concurs that these limits are appropriate but would express them as ceilings rather than as TWAs (Ex. 8-47, Table N7) These are the limits recently established for these substances in general industry.

Methyl chloroform, which is also called trichloroethane, is a clear, nonflammable liquid with a sweetish. chloroform-like odor (Clayton and Clayton 1982, p. 3509; ACGIH 1986, p. 382). This substance is a widely used metal degreaser (HSDB 1987). It is also used as an insecticidal fumigant and as a solvent, dry cleaning agent, and chemical intermediate (Hayes 1982, p. 152; HSDB 1987). Methyl chloroform was formerly used in agriculture to degreen citrus fruits and to fumigate strawberries (HSDB 1987). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

The primary health effects associated with exposure to methyl chloroform are narcosis, irritation, and liver damage. The oral LD₅₀ values range from 5.6 to 11.2 g/kg for rats, mice, rabbits, and guinea pigs (RTECS 1990). The LCso in rats is 18,000 ppm for 4 hours (RTECS 1990). Skin absorption is apparently not a significant route of exposure: The dermal LD₅₀ in rabbits is greater than 16 g/kg (Torkelson, Oyen, McCollister, and Rowe 1958/Ex. 1-768). Applied to the skin or eyes, however, methyl chloroform causes mild-to-moderate irritation (RTECS 1990). Rats exposed for 1 hour to a methyl chloroform concentration of 10,000 ppm lost their coordination and lapsed into semiconsciousness (Hayes 1982, p. 152). Guinea pigs exposed to 1000 ppm for 3 hours/day, 5 days/week for 3 months showed, at autopsy, lung inflammation and fatty infiltration of the liver (Hayes 1982, p. 152). Repeated exposures to 500 ppm of methyl chloroform vapor for 7 hours/day, 5 days/week for 6 months caused no apparent adverse effects in guinea pigs, rabbits, or monkeys (Torkelson, Oyen, McCollister, and Rowe 1958/Ex. 1-768). Tests in rats and

mice for teratogenicity and carcinogenicity have demonstrated negative results (Schwetz, Leong, and Gehring 1975/Ex. 1–757; NIOSH 1976m; Weisberger 1977/Ex. 1–694); IARC 1979, Vol. 20, p. 515–531).

In humans, narcotic effects begin to occur at methyl chloroform concentrations of approximately 350 ppm (Mackay et al. 1987). For example, reaction times, manual dexterity, and perceptual speed were adversely affected in volunteers exposed to 350 ppm (Gamberale and Hultengren 1973). Deaths from anesthesia and/or cardiac sensitization have been noted in employees working in confined areas (NIOSH 1976m).

Three recent studies (McLeod et al. 1987, Karlsson et al. 1987, and Mackay et al. 1987) suggest, respectively, that methyl chloroform causes chronic cardiac toxicity on long-term exposure, may have toxic effects on brain cells, and may cause behavioral changes after 3.5-hour exposures to concentrations of approximately 350 ppm. Kramer and coworkers (1978/Ex. 1-515) conducted an epidemiological study of men and women exposed for periods ranging from several months to 6 years to methyl chloroform at levels that occasionally exceeded 200 ppm; when compared with matched-pair controls, no adverse exposure-related effects were found in the exposed individuals (Kramer, Ott, Fulkerson et al. 1978/Ex. 1-515).

Based on this evidence in humans and animals, OSHA is proposing in construction and maritime to retain its PEL of 350 ppm as an 8-hour TWA and to add a STEL of 450 ppm for methyl chloroform; OSHA is also proposing to extend both limits to agriculture. The Agency preliminarily concludes that these limits will protect workers in these sectors against the significant risk of narcotic, irritant, and hepatotoxic effects, which together constitute material health impairments that are potentially associated with exposure to methyl chloride. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

NAPHTHA (Coal Tar) CAS: 8030–30–6; Chemical Formula: H.S. No. 2113

In general industry, construction, and maritime, OSHA's PEL for coal tar naphtha is 100 ppm. There is no PEL in agriculture. Neither ACGIH nor NIOSH has a limit for this substance. OSHA is proposing an 8-hour TWA PEL of 100 ppm for coal tar naphtha in agriculture. In addition, promulgation of this limit will make OSHA's PEL for this

substance consistent across all regulated sectors.

Coal tar naphtha is a mixture of inconstant nature prepared from the distillation of coal; this substance contains xylenes, ethyl benzene, cumene, and occasionally, toluene. Coal tar naphtha, also called coal tar distillate, aromatic petroleum naphtha, coal tar light oil, and coal tar oil, is a light oil fraction distilling to 200 °C (Grayson 1985, p. 1154). Coal tar naphtha is used for waterproofing, in paints, pipe coatings, on roads, in sealants, in roofing operations, and in pesticides.

Coal tar naphtha is toxic by inhalation and skin absorption. Exposure causes moderate eve and upper respiratory tract irritation and narcosis (Cralley and Cralley 1985, p. 176). Exposure to 1500 ppm for 8 hours was lethal to rats (Carpenter, Geary, Meyers et al. 1977). If benzene is present in the naphtha mixture in substantial quantities. exposure may lead to bone marrow effects (Clayton and Clayton 1981, p. 3392). Rodents, canines, and primates exposed to high (not further specified) concentrations of coal tar naphtha on subchronic experimental regimens showed decreased weight gain, central nervous system depression, decreased white blood cell counts, and, in some animals, cataracts (Nau, Neal, and Thornton 1966, in Clayton and Clayton 1981, p. 3418; Carpenter, Geary, Meyers et al. 1977). Rats exposed to a 3200-ppm concentration for 2 months survived but showed damage to the liver and kidney at autopsy (NIOSH/OSHA 1981).

Humans can detect the odor of coal tar naphtha at an airborne concentration of 0.07 ppm, and some exposed individuals experience the onset of sensory irritation at 25 ppm (Carpenter, Geary, Meyers et al. 1977). Acute exposure to this substance (concentrations no specified) leads to eye, nose, and throat irritation, and to narcotic signs and symptoms, including vertigo, nausea, dyspnea, and, if benzene is present, neurotoxicity. Chronic exposure also causes central nervous system depression and, depending on the benzene content, hematopoietic system changes (Sundmeyer, in Clayton and Clayton 1981, p. 3392).

Based on this evidence, OSHA is proposing an 8-hour TWA PEL of 100 ppm for coal tar naphtha in agriculture. The Agency believes that this limit is necessary to reduce the significant risk of irritation, narcosis, and hematopoietic changes associated with exposure to coal tar naphtha. In addition, promulgation of this limit will make

OSHA's PEL for this substance consistent across all regulated sectors. OCTANE CAS: 111-65-9; Chemical Formula:

CH₃(CH₂)₆CH₃ H.S. No. 1296

OSHA's limit for octane in construction, shipyards, marine terminals, and longshoring operations is 400 ppm as an 8-hour TWA. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*s for this substance were 300-ppm as an 8-hour TWA and 375-ppm as a 15-minute STEL; NIOSH (1977a/Ex. 1-233) recommends a 75-ppm 10-hour TWA and a 385-ppm 15-minute ceiling limit. In construction, maritime, and agriculture, OSHA is proposing an 8hour TWA PEL of 300 ppm and a 15minute STEL of 375 ppm for octane. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

Octane is a colorless, flammable liquid that has 17 isomers and an odor like that of gasoline. Octanes occur naturally in natural gas and crude oil and are found industrially in some petroleum solvents and in gasoline. The n-octane isomer is used as a solvent and in organic synthesis, while the iso-octane isomer is a standard used to measure the anti-knock properties of gasolines (ACGIH 1986, p. 448; Proctor, Hughes, and Fischman 1988, p. 384).

Mice exposed to octane concentrations of 6600 to 13,700 ppm developed narcosis within 30 to 90 minutes (Fuhner 1921, as cited in ACGIH 1986/Ex. 1–3, p. 448). Mice exposed to a 16,000-ppm concentration of iso-octane suffered respiratory arrest, and exposure to approximately 7500 ppm of the n-isomer caused loss of the righting reflex in the same species (Swann, Kwon, Hogan, and Snellings 1974).

Flury and Zernik (1931h) believed the narcotic concentration of octane in humans to be 5000 ppm; Patty and Yant (1929) placed the narcotic concentration at 8000 ppm. The signs and symptoms of over-exposure to the vapors of octane include giddiness, vertigo, headache, and stupor; convulsions have also been reported (HSDB 1986). Repeated or prolonged skin contact causes dryness and cracking of the skin (New Jersey Fact Sheet 1987, p. 2).

As discussed above for the other C₅–C₈ alkanes, the limits recommended by NIOSH for octane (1977a/Ex. 1–233) are based on NIOSH's belief that all C₅–C₈ alkanes present a neurotoxic hazard similar to that of n-hexane. OSHA disagrees with this conclusion, finding instead (54 FR 2428) that the neurotoxic properties of n-hexane are unique

among these substances and thus that a PEL lower than the one being proposed for octane is not warranted at this time.

Accordingly, OSHA is proposing limits for octane of 300 ppm as an 8-hour TWA and 375 ppm as a 15-minute STEL in the construction, maritime, and agriculture sectors. The Agency preliminarily concludes that these limits will protect workers in these sectors from the significant risk of narcosis that is associated with octane exposures. OSHA believes that these limits will substantially reduce these significant risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

PENTANE

CAS: 109-66-0; Chemical Formula: C₆H₁₂ H.S. No. 1306

OSHA currently has an 8-hour TWA limit of 500 ppm for pentane in construction, shipyards, and marine terminals, and an 8-hour TWA of 1000 ppm in longshoring operations. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*-TWA was 600 ppm and the TLV®-STEL was 750 ppm. NIOSH (1977a/Ex. 1-233; Ex. 8-47, Table N2) has recommended that workplace exposures to pentane not exceed 120 ppm as a 10-hour TWA and 610 ppm as a 15-minute ceiling limit. The Agency is proposing PELs of 600 ppm as an 8-hour TWA and 750 ppm as a 15-minute STEL in construction, maritime, and agriculture. This action will make OSHA's PELs for pentane consistent across all industry sectors and will provide protection against pentane's effects for workers in all OSHAregulated sectors. The adoption of a 600 ppm PEL for all affected sectors is important (1) to maintain uniformity when health and feasibility data are equivocal, (2) to simplify enforcement, and (3) to reduce confusion about the limit among the public, employers, and employees.

Pentane, a colorless, flammable liquid with a gasoline-like odor, is usually encountered in volatile petroleum fractions, some of which are used as solvents. Pentane is used as a pesticide and is also an incidental additive in liquid grain fumigants. In addition, it finds use as a fuel, in dry cleaning, and in degreasing operations (HSDB 1986). Pure pentane is used as a blowing agent for plastics, in solvent extraction, and in ice manufacture. When used in accordance with the EPA label and in pesticidal applications, pentane is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act.

Exposure to pentane causes both narcosis and mucous membrane irritation in humans and animals. The lowest lethal concentration in mice is 325 g/m3 for 2 hours; at this concentration, behavioral signs and symptoms were apparent (RTECS 1990). The intravenous LD50 in mice is 446 mg/ kg (RTECS 1990). Mice exposed to a 128,000 ppm concentration became deeply anesthetized, and one in four of these animals died (Swann, Kwon, Hogan et al. 1974). Respiratory irritation and mild narcosis occurred in animals of the same species at an exposure concentration of 32,000 to 64,000 ppm for 5 minutes (Swann, Kwon, Hogan et al. 1974). The reported lethal concentration in humans is 130,000 ppm (Flury and Zernik 1931j/Ex. 1-994; Swann, Kwon, and Hogan 1974/Ex. 1-124). According to Patty and Yant (1929), humans exposed for 10 minutes to 5000 ppm did not report experiencing any adverse symptoms.

A study by Gaultier, Rancurel, Piva. and Efthymioc (1973/Ex. 1-123) reports that five cases of polyneuropathy occurred among employees exposed to a solvent containing 80 percent pentane. 14 percent heptane, and 5 percent hexane. Based largely on these results, NIOSH (1977a/Ex. 1-233) recommended the same occupational limit for all Co-Co alkanes as for the neuropathic agent nhexane (350-mg/m3 TWA and 1800-mg/ m3 15-minute short-term limits; these limits approximately equal a 120-ppm 8hour TWA and a 610-ppm 15-minute STEL for pentane). As discussed above in connection with the entries for heptane and octane, OSHA believes that n-hexane is uniquely neuropathic because it is metabolized to 2,5hexanedione, and thus that all Co-Co alkanes are not equally toxic. The Agency concluded in the prior rulemaking that a metabolite of nhexane exhibits unique neurotoxic properties and thus that the Gaultier, Rancurel, Piva, and Efthymioc (1973/Ex. 1-123) study does not provide isomerspecific exposure data supporting limits at the levels of the NIOSH RELs.

Also in the prior rulemaking, one commenter (Ex. 3–896) objected to the proposed STEL for pentane on the grounds that the health evidence did not justify a STEL. OSHA responded to this commenter (54 FR 2428) by pointing out that a STEL is needed to protect workers from the significant neurotoxic effects potentially associated with the high short-term excursions possible in the absence of a STEL.

Based on this evidence and reasoning, the Agency is proposing to establish an 8-hour TWA of 600 ppm and a 15-minute STEL of 750 ppm as the permissible exposure limits for pentane in construction, maritime, and agriculture. OSHA preliminarily concludes that these limits will protect exposed workers in these sectors from the narcosls associated with pentane exposure. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

2-PENTANONE (METHYL PROPYL KETONE)

CAS: 107-87-9; Chemical Formula: CH₃COC₃H₇

H.S. No. 1307

The current OSHA limit for 2-pentanone in construction, shipyards, marine terminals, and longshoring operations is 200 ppm as an 8-hour TWA. There is no PEL in agriculture. The 1987–1988 ACGIH TLV*–TWA was 200 ppm and the TLV*–STEL was 250 ppm; NIOSH (1978k) has recommended a 150-ppm limit as a 10-hour TWA. In construction and maritime, the Agency is proposing to retain the 200-ppm TWA PEL and to establish a 15-minute STEL of 250 ppm for 2-pentanone; in agriculture, OSHA is proposing both the 8-hour TWA and STEL.

2-Pentanone, also called methyl propyl ketone, is a clear, flammable liquid with a strong odor resembling that of acetone or ether. 2-Pentanone is used as a solvent and flavoring agent and in organic synthesis (ACGIH 1986, p. 408; Hawley's 1987, p. 780).

2-Pentanone has an oral LD50 in rats of 1600 mg/kg and an LC50 in the same species of 2000 ppm for 4 hours (RTECS 1990). The dermal LDso for this substance in rabbits is 6500 mg/kg (RTECS 1990). Acutely poisoned animals display agitation, loss of balance, and staggering (Miller, Valaer, and Sayers 1940). Both the ACGIH- and NIOSHrecommended limits for 2-pentanone are based on the results of a study by Specht, Miller, Valaer, and Sayers (1940/Ex. 1-1179), which found that guinea pigs exhibited irritation and weakness on exposure to 2500 ppm and that exposure to 5000 ppm produced narcosis and coma. Based on this evidence, the authors concluded that 2pentanone is considerably less toxic than methyl butyl ketone but is more toxic than methyl ethyl ketone, and, in addition, that 2-pentanone is likely to be more irritating than either methyl ethyl ketone or acetone. The ACGIHrecommended limits are thus based on a judgment that the 200-ppm TLV*-TWA and 250-ppm TLV*-STEL are low enough to prevent narcosis and irritation.

NIOSH (1978k) relied on the findings both of the Specht, Miller, Valaer, and Sayers (1940/Ex. 1-1179) study discussed above and of the Nelson, Enge, Ross et al. study (1943/Ex. 1-66); these latter authors reported that volunteers complained of slight irritation on exposure to a 100-ppm concentration of methyl ethyl ketone. NIOSH reasoned that, because 2-pentanone had been found by Specht, Miller, Valaer, and Sayers (1940/Ex. 1-1179) to be at least as irritating as methyl ethyl ketone, a "slight reduction" in the limit was warranted for 2-pentanone (NIOSH 1978k). Therefore, NIOSH recommends a 150-ppm limit for 2-pentanone, and this recommendation was reiterated in the prior air contaminants rulemaking (Ex. 8-47, Table N2; Tr. 3-86).

However, OSHA believes that the combination of a 200-ppm TWA PEL and a 250-ppm STEL will ensure that concentrations of 2-pentanone in construction, maritime, and agricultural workplaces are maintained at levels that will prevent the occurrence of the adverse health effects associated with exposures to this chemical. Accordingly, the Agency is proposing to establish these limits to reduce the significant risk of narcosis that is associated with exposures to 2-pentanone at elevated short-term levels. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

STODDARD SOLVENT CAS: 8052-41-3; Chemical Formula: C₀H₂₀

H.S. No. 1371

OSHA's current limit for Stoddard solvent in construction, shipyards, marine terminals, and longshoring operations is 200 ppm as an 8-hour TWA. There is no PEL in agriculture. The 1987–1988 ACGIH TLV*-TWA was 100 ppm, and NIOSH concurs that this limit is appropriate (Ex. 8-47, Table N1). OSHA is proposing to reduce the PEL for Stoddard solvent in construction and maritime to 100 ppm as an 8-hour TWA and to extend this limit to agriculture. This is the limit recently established for this substance in general industry.

Stoddard solvent is a refined petroleum solvent that is a mixture of straight- and branched-chain paraffins, naphthenes and aromatic hydrocarbons. This substance is widely used as a solvent and diluent in paints, coatings, and waxes and as a metal degreasing agent. It is also often found as an ingredient of herbicides (ACGIH, 1986, p. 537). When used in pesticidal applications and as directed on the label, this substance is regulated by the

EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Stoddard solvent is an irritant of the eyes, skin, and mucous membranes and a narcotic in humans and animals. Inhalation of a 1400-ppm concentration of this substance for 8 hours was lethal to some rats and cats (Carpenter et al. 1975). Acutely poisoned animals showed signs of eye irritation, lost their coordination, and had a bloody discharge from the nose (Carpenter et al. 1975). Cats exposed to 1700 ppm for 2.5 to 7.5 hours convulsed before death (Carpenter et al. 1975). Rats exposed to a 330-ppm concentration of Stoddard solvent 6 hours/day for 65 days had tubular degeneration of the kidneys at autopsy (Carpenter et al. 1975).

Humans exposed to a 470-ppm concentration of Stoddard solvent for 15 minutes experienced eye irritation (RTECS 1990). In prolonged or repeated contact with the skin, this substance causes dermatitis (AIHA 1978). Inhalation of large (not further specified) concentrations causes nausea, vomiting, cough, and pulmonary irritation (Cohen and Maier 1974). Several studies suggest that chronic exposure to Stoddard solvent vapors for periods ranging from 3 months to 20 years may cause hepatic involvement, hypoplasia of the bone marrow, and aplastic anemia (Scott et al. 1959; Prager and Peters 1970).

The NIOSH RELs for Stoddard solvent are derived from NIOSH's recommended limits for all of the Co-Co alkanes; NIOSH recommended the same limit for Stoddard solvent as for all Cs-Cs alkanes both because of the lack of specific scientific data on Stoddard solvent's chronic effects and because of a report of polyneuropathy occurring among workers exposed to jet fuels containing mixtures of kerosene and gasoline. NIOSH reasoned that, although the Co-Co alkanes present in jet fuel may have been implicated, it was possible that the heavier hydrocarbon components may also have been responsible. Thus, the NIOSH RELs for Stoddard solvent reflect a concern that higher-molecular-weight hydrocarbons may be neuropathic. However, OSHA does not believe that there is evidence that the C10 and higher-molecular-weight hydrocarbons cause neuropathies, and NIOSH also now agrees, based on a reevaluation of the evidence, that a 100ppm 8-hour TWA limit is appropriate for this substance (Ex. 8-47, Table N1).

OSHA is proposing to establish an 8-hour TWA PEL of 100 ppm in construction, maritime, and agriculture to reduce the significant risk of eye irritation, narcosis, polyneuropathy, and kidney damage that have been

demonstrated to occur in both humans and animals. The Agency believes that the proposed limit for Stoddard solvent is necessary to substantially reduce these risks to workers in these sectors. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

STYRENE

CAS: 100-42-5: Chemical Formula: C6H5CH=CH2

H.S. No. 1372

OSHA's current permissible exposure limit for styrene in construction, shipyards, marine terminals, and longshoring operations is 100 ppm as a ceiling limit. There is no PEL in agriculture. In construction and maritime, OSHA is proposing to revise this limit to 50 ppm as an 8-hour TWA and to add a 15-minute STEL of 100 ppm, based on both the 1987-1988 ACGIH TLV®s and the NIOSH RELs, which are identical. OSHA is also proposing these limits in agriculture. NIOSH (Ex. 150, Table N1) concurs that the proposed limits are appropriate for styrene.

Styrene monomer is a colorless, oily liquid with an aromatic odor. It is used as a solvent for resins and synthetic rubber and as an intermediate in chemical synthesis. Styrene is also used as a flavoring agent and in the manufacture of polymerized synthetics (HSDB 1987; Proctor, Hughes, and

Fischman 1988, p. 448).

Styrene is an irritant, a narcotic, and a neuropathic agent; some studies also show that animals exposed to styrene vapor develop tumors. The oral LD50 in rats is 5000 mg/kg, and the LC50 in the same species is 24 g/m3 for 4 hours (RTECS 1990). Rats and guinea pigs exposed to a 1300-ppm concentration of styrene for 8 hours/day, 5 days/week for 6 months experienced often-lethal pulmonary irritation (guinea pigs) and, at autopsy, showed increased kidney and liver weights (rats) (IARC 1979, Vol. 19, p. 239). Oral exposure to styrene has been shown to cause liver enzyme changes and other hepatic effects in rats and dogs (EPA 1987, pp. 6-7)

There is a considerable body of health-effects information in humans for styrene in the toxicological literature. Human volunteers exposed to an 800ppm concentration of styrene for 4 hours experienced eye and throat irritation and also reported listlessness, drowsiness, and impaired balance (Carpenter et al. 1944). At a concentration of 376 ppm, five human volunteers experienced eye and respiratory tract irritation within 20 minutes and also demonstrated decrements in motor function (Stewart

et al. 1968). Three subjects exposed to a 100-ppm concentration of styrene for 90 minutes had slower reaction times; on repeated exposure, sleepiness, fatigue, headache, difficulty in concentration, malaise, nasal irritation, and nausea occurred in another group of subjects (NIOSH 1983a, p. 150).

Effects attributable to central nervous system depression were seen in a 6week study involving human subjects exposed to 20, 100, or 125 ppm styrene; the authors of the study reported visual-

evoked-response and

electroencephalogram changes in these subjects (NIOSH 1983a, p. 150). Other studies have reported irritation of the eyes and throat at concentrations ranging from 1 to 100 ppm (NIOSH

1983a, p. 151).

Workers in reinforced plastics (RP) facilities in many countries have also evidenced narcotic effects as a consequence of styrene exposure. Swedish, Dutch, and Czechoslovakian workers in RP plants complained of headache, fatigue, drowsiness, giddiness, and dizziness at exposure levels in the range of 4 to 195 ppm (NIOSH 1983a, p. 151). Respiratory effects have been observed in United States RP workers exposed to from 9 to 111 ppm styrene; symptoms included wheezing, shortness of breath, and chest tightness. Another study showed a significantly greater number of RP workers with abnormal pulmonary function when compared with workers from a nonstyrene facility (NIOSH

1983a, pp. 153-154).

Several animal and human studies have suggested that styrene may be a carcinogen. A nested case-control study conducted by McMichael, Spirta, Gamble, and Tousey (1976/Ex. 1-206) found significantly increased risks of lymphatic and hematopoietic cancer, lymphatic leukemia, and stomach cancer among workers exposed to both styrene and butadiene. A retrospective cohort mortality study by Meinhardt, Lemen, Crandall, and Young (1982/Ex. 1-199), also among workers exposed concurrently to styrene and butadiene, reported an excess risk of leukemia and aleukemia in these workers. In a study sponsored by the Chemical Manufacturers Association (Dow 1978, as cited in EPA 1987/Ex. 1-836), male and female Sprague-Dawley rats were exposed to styrene vapor at concentrations of 600 to 1200 ppm, 6 hours/day, 5 days/week, for 18 or 20 months. The higher exposure level was reduced to 1000 ppm after the first 2 months of exposure because of excessively reduced weight in the male rats. A statistically significant increased incidence of mammary tumors was

reported in low-dose female rats (7 of 87) compared with controls (1 of 85); no increase in mammary tumors was reported among high-dose female rats. The authors questioned the significance of this response, since historical control animals from the same laboratory showed a higher background incidence of mammary tumors than did the controls used in this study.

In a 1979 NCI study (NCI 1979b/Ex. 1-948), male and female B6C3F1 mice and Fischer 344 rats were treated by gavage 5 days/week for 78 weeks (low-dose rat groups were treated for 103 weeks). The study was terminated at 91 weeks for mice and at 104 to 105 weeks for rats. Dose-related increases in alveolar/ bronchiolar adenomas and carcinomas were observed only in the low-dose (150 mg/kg) and high-dose (300 mg/kg) male mice; the incidence of tumors for vehicle controls, low-dose, and high-dose male mice was 0/20, 6/44, and 9/43, respectively. Although the historical incidence of tumors among untreated controls was 12 percent (32/271), the historical incidence of vehicle controls was 0/40.

Based on this evidence, OSHA preliminarily finds that workplace exposures to styrene are associated with health effects ranging from narcosis to neuropathies and irritation; in addition, although the evidence is not conclusive, styrene exposure may cause cancer. The Agency believes that an 8hour TWA PEL of 50 ppm and a STEL of 100 ppm are necessary to protect workers in construction, maritime, and agriculture against these significant occupational risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

TOLUENE

CAS: 108-88-3; Chemical Formula: C₆H₅CH₃ H.S. No. 1397

The current OSHA standard for toluene in construction, shipyards, marine terminals, and longshoring operations is 200 ppm as an 8-hour TWA limit. There is no PEL in agriculture. The 1987-1988 ACGIH TLV*-TWA for toluene was 100 ppm and the TLV*-STEL was 150 ppm; NIOSH recommends a 100-ppm 8-hour TWA and a 10-minute ceiling of 200 ppm. The Agency is proposing an 8-hour TWA PEL of 100 ppm and a STEL of 150 ppm for toluene: NIOSH (Ex. 8-47, Table N1) concurs with these limits. These are the limits recently established for these substances in general industry.

Toluene is a flammable, colorless liquid with an aromatic, hydrocarbon odor. It is used primarily in the manufacture of benzene and other chemicals. Toluene is also a constituent of solvents, cements, inks, spot removers, cosmetics, antifreeze, and gasoline (HSDB 1989; Proctor, Hughes, and Fischman 1988, p. 477).

Toluene is an irritant of the eyes and skin and a central nervous system depressant in humans and animals. The oral LDso in rats is 5000 mg/kg, and the lowest lethal concentration in the same species is 4000 ppm for 4 hours (RTECS 1990). The dermal LD50 in rabbits is 12,124 mg/kg (RTECS 1990). Cats exposed to 7800 ppm showed tremors and prostration within 80 minutes and a mild degree of narcosis within 2 hours (Carpenter et al. 1976). Exposure of cats to near-lethal toluene concentrations for 6 hours resulted in the development of vacuoles in the corneal epithelium (Grant 1986, p. 927). In contact with the skin, toluene causes marked irritation (Wolf et al. 1956). Chronic exposure to concentrations ranging from 100 to 1000 ppm caused behavioral symptoms in rats (Ishikawa and Schmidt 1973).

Von Oettingen, Neal, Donahue et al. (1942/Ex. 1-875) exposed human volunteers to toluene levels ranging from 50 ppm to 800 ppm for 8 hours/day. These authors report that exposures to 50 ppm cause drowsiness and headaches and that exposures at 100 ppm result in sleepiness, moderate fatigue, and headaches. At 200 ppm. effects included impairment of coordination and reaction times. Later studies by Ogata, Tomokuni, and Takatsuka (1970/Ex. 1-352) showed an increase in reaction time, a decrease in pulse rate, and a decrease in systolic blood pressure in humans exposed to 200 ppm toluene for 7 hours.

A study by Greenberg, Mayers, Heinmann, and Moskowitz (1942/Ex. 1-325) reported that painters exposed to toluene levels of 100 to 1100 ppm exhibited enlarged livers, a moderate decrease in red blood cell counts, enlarged red blood cells, and absolute lymphocytosis, but no leukopenia. Wilson (1943/Ex. 1-403) observed 1,000 workers exposed to toluene at levels ranging from 50 ppm to 1500 ppm for periods of 1 to 3 weeks. One hundred of these workers developed symptoms severe enough to require hospitalization. At levels less than 200 ppm, 60 of these employees experienced headache. fatigue, and lack of appetite. Those workers exposed to 200 to 500 ppm toluene experienced headache, nausea. bad taste in the mouth, lassitude, temporary amnesia, impaired coordination, and anorexia. Levels of exposure from 500 to 1500 ppm resulted

in nausea, headache, dizziness, anorexia, marked loss of coordination. diminished reaction time, pronounced weakness, and heart palpitations. Red cell counts were also decreased, and two cases of aplastic anemia required lengthy hospital treatment; however, the author noted that he could not rule out the possibility that benzene contamination of the toluene was the cause of these blood effects. Aplastic anemia (including one fatal case) has been noted in six glue sniffers; toluene was the base solvent in the glue (Powars 1965/Ex. 1-433). A man who had inhaled toluene regularly at unspecified levels for 14 years developed permanent encephalopathy (Knox and Nelson 1966/

In the prior air contaminants rulemaking, one commenter (Ex. 3-896) argued that a short-term exposure limit for toluene was not justified. OSHA responded that, as in the cases of octane and pentane, a short-term exposure limit is necessary to ensure that workers are not exposed at the elevated levels possible with a TWA limit alone, particularly in light of the fact that concentrations only slightly above the 8hour TWA may cause incoordination and amnesia. For example, workers could be exposed to toluene at levels as high as several hundred ppm if the Agency only had an 8-hour TWA PEL for this substance.

OSHA is proposing to establish an 8-hour TWA PEL of 100 ppm and a STEL of 150 ppm for toluene in the construction, maritime, and agriculture industries. The Agency preliminarily concludes that studies clearly indicate that a significant risk of hepatotoxic, behavioral, and nervous system effects exists at toluene levels substantially at or only slightly above the Agency's current PEL. OSHA believes that the proposed limits are necessary to substantially reduce this risk.

TRICHLOROETHYLENE
CAS: 79-01-6; Chemical Formula:
CCl₂-CHCl

H.S. NO. 1406

OSHA's current limit for trichloroethylene in construction, shipyards, marine terminals, and longshoring operations is 100 ppm as an 8-hour TWA. There is no PEL in agriculture. The Agency is proposing a TWA PEL of 50 ppm and a STEL of 200 ppm for this substance in construction, maritime, and agriculture. The 1987–1988 ACGIH TLV*-TWA for trichloroethylene was 50 ppm and the TLV*-STEL was 200 ppm. The NIOSH REL is 25 ppm as a 10-hour TWA; however, NIOSH concurs (Ex. 8–47.

Table N6A) with the limits being proposed.

Trichloroethylene is a colorless, nonflammable, noncorrosive liquid with the sweet odor characteristic of some chlorinated hydrocarbons. It is used as a carrier solvent for fungicides and insecticides, as a degreasing solvent, as a chemical intermediate, and in dry cleaning and extraction operations. It is also occasionally used as an anesthetic and analgesic (HSDB 1990; Proctor, Hughes, and Fischman 1988, p. 486).

Trichloroethylene is a central nervous system depressant, an irritant of the eyes and skin, and, in experimental animals, a carcinogen. The intraperitoneal LD50 in rats is 1282 mg/ kg, and the oral LD50 and LC50 in mice are 2402 mg/kg and 8450 ppm for 4 hours, respectively (RTECS 1990). Acutely poisoned animals die of respiratory failure or cardiac arrest (ACGIH 1986, p. 595). Prolonged or repeated contact with the skin of rabbits caused severe irritation; dropped into the eyes of rabbits, trichloroethylene produced moderate irritation (RTECS 1990). Rats inhaling a trichloroethylene concentration of 3000 ppm for 8 hours did not become anesthetized; however, increasing the concentration to 4800 ppm caused deep anesthesia in these animals (Adams et al. 951). At doses that cause deep anesthesia, trichloroethylene is a cardiac sensitizer in dogs (Reinhardt et al. 1973). Rats, rabbits, and guinea pigs exposed repeatedly (7 hours/day, 5 days/week for 6 months) to trichloroethylene concentrations ranging from 400 to 3000 ppm showed increases in liver and kidney weights at autopsy (Adams et al. 1951).

There is a considerable body of carcinogenicity data on trichloroethylene. In an NCI bioassay (1976b/Ex. 1-168), mice given trichloroethylene by gavage developed hepatocellular carcinomas, but rats did not. The species difference in response was attributed to a difference in the way trichloroethylene is metabolized between the mouse and rat (Stott, Quast, and Watanabe 1982/Ex. 1-833). An inhalation study in mice, rats, and Syrian hamsters (Henschler, Romen, Reichert et al. 1980/Ex. 1-330) found an increase only in the occurrence of malignant lymphomas in mice, which the authors attributed to the strain of mouse used (NMRI).

Several other bioassays on trichloroethylene have recently been published. Fukuda, Takemoto, and Tsuruta (1983/Ex. 1–1109) exposed female rats and mice to 50, 150, or 450 ppm trichloroethylene for 103 weeks and reported an increased incidence of lung tumors among mice only. Maltoni, Lefemine, and Cotti (1986/Ex. 1-1160) exposed rats and mice to 100, 300, or 600 ppm trichloroethylene and reported a significant increase of renal adenocarcinomas and Leydig cell tumors in rats, as well as a significant increase in hepatomas and lung tumors in mice. In 1986, the NTP reported an increase in the incidence of kidney tumors in rats given trichloroethylene by gavage; however, the NTP considered the tumor response to be weak (3 of 49 animals) and reported that the results were only statistically significant after corrections for high mortality were

In humans, trichloroethylene primarily affects the central nervous system and liver; some studies have shown that chronic exposure to concentrations below 100 ppm is associated with a variety of nervous disturbances. Bardodej and Vyskocil (1956/Ex. 1-461) have reported that workers report signs and symptoms of trichloroethylene poisoning, including tremors, giddiness, anxiety, and alcohol intolerance, when they are exposed to concentrations of trichloroethylene above 40 ppm.

Haas (1960) and Grandjean, Muchinger, Turrian et al. (1955/Ex. 1-324) reported nervous symptoms among workers exposed for 5 years or more to trichloroethylene concentrations ranging from 1 to 335 ppm; the frequency of complaints increased when average exposures exceeded 40 ppm.

A number of epidemiologic investigations having cohorts as large as 7688 workers have found no correlation between cancer mortality and exposure to trichloroethylene (Novotna, David, and Malek 1971; Axelson, Andersson, Hogstedt et al. 1978/Ex. 1-713; Tola, Vilhunen, Jarvinen, and Korkala 1980/ Ex. 1-391).

Based on this evidence, OSHA preliminarily concludes that the current 100-ppm TWA PEL for trichloroethylene is insufficiently protective against this substance's exposure-related central nervous system (CNS) effects and, further, that exposure to trichloroethylene may present a possible carcinogenic hazard. As stated above, OSHA is proposing an 8-hour 50 ppm TWA and 200 ppm STEL for this substance in these sectors. These are the final limits recently established for general industry. However, as OSHA indicated in the Agency's brief to the U.S. Court of Appeals for the Eleventh Circuit in the pending case AFL v. OSHA, Nos. 89-7185, et al. " * * concludes that the evidence may warrant a lower limit if the next PEL updated establishes the risk of central nervous system effects and carcinogenicity at levels below 50 ppm."OSHA does not intend to resolve that issue in this rulemaking, because its priority in this rulemaking is to extend the updated general industry PELs to all other segments. OSHA believes that attempting to resolve the issues of central nervous system effects and carcinogenicity and similar complex issues in this rulemaking would make this rulemaking difficult to complete in a timely fashion. OSHA will consider for all industry sectors whether a lower PEL is needed in the first PEL update.

Preliminary Conclusions for This Group of Narcotic Agents

OSHA preliminarily concludes that workers exposed to these narcosiscausing substances in construction, maritime, and agriculture workplaces are at significant risk of experiencing a broad range of narcotic effects, including loss of consciousness, incoordination, inability to concentrate, drowsiness, irritability, poor judgment, and inappropriate behavior. These

highly undesirable and potentially serious health effects additionally have the potential to cause serious workplace accidents and injuries because they interfere with reaction times, muscle coordination, and the ability to make good decisions and exercise good judgment. The new or revised exposure limits being proposed by OSHA will protect workers in construction, maritime, and agriculture from experiencing these significant risks in their places of work and will contribute to a substantial reduction in these risks. In addition, promulgation of these limits will make OSHA's PELs for these substances consistent across all regulated sectors.

3. Substances for Which Proposed Limits Are Based on Avoidance of Sensory Irritation

Introduction. Exposure to many chemical agents is associated with the development of sensory irritation, which is initiated when these substances come into contact with the eyes, the mucous membranes, or the skin. OSHA is proposing to establish limits in agriculture, maritime, and construction for a large group of sensory irritants; the limits being proposed would, if established, provide protection against sensory irritation to workers in all of the sectors covered by OSHA. These substances are shown in Table C3-1, along with their current OSHA limits in construction and maritime and the limits being proposed for workplaces in agriculture, construction, and maritime.

Table C3-1 also shows the HS and CAS numbers for these substances and the 1987-1988 ACGIH TLV®s- and NIOSH REL (if any) for each substance. The right-hand column of Table C3-1 shows the proposed limits, which are identical to those recently promulgated for these substances in general industry

(see 54 FR 2434).

TABLE C3-1.—LIST OF SUBSTANCES FOR WHICH PROPOSED LIMITS ARE BASED ON AVOIDANCE OF IRRITANT EFFECTS

H.S. No./Chemical name	CAS No.	Current OSHA PEL in construction and maritime	1987–1988 ACGIH TLV# ***	NIOSH REL ***	Proposed OSHA PEL in construction, maritime, and agriculture

OSHA's TWA limits are for 8-hour exposures; its STELs are for 15 minutes unless otherwise specified; and its ceilings are peaks not to be exceeded for any

CSHA'S TWA limits are for 8-hour exposures; its STELs are for 15 minutes unless otherwise specified; and its ceilings are peaks not to be exceeded for any period of time; OSHA's PELs do not currently apply in Agriculture.

**The ACGIH TLV®-TWA is for an 8-hour exposure; its STELs are 15-minute limits not to be exceeded more than 4 times per day with a minimum of 60 minutes between successive STEL exposures; and its ceilings are peaks not to be exceeded for any period of time.

**NIOSH TWA limits are for 10 hour/day, 40 hour/week exposures unless otherwise specified, and its ceilings are peaks not to be exceeded for any period of time unless a duration is specified in parentheses.

*NIOSH considers this substance a potential occupational carcinogen and recommends that exposures be reduced to the lowest feasible concentration.

**No exposure limit recommended because of the absence of a reliable monitoring method; use appropriate engineering and work practice controls to reduce exposure to lowest feasible concentration.

Description of the Health Effects

Irritant effects are readily perceived by affected individuals. The symptoms of sensory irritation include stinging, itching, and burning of the eyes, tearing (or lacrimation), a burning sensation in the throat or nasal passages, rhinitis (nasal inflammation), cough, sputum production, chest pain, wheezing, and dyspnea (breathing difficulty). In the majority of cases, the onset of symptoms occurs rapidly upon exposure to the irritant; it is therefore easy to associate the causative agent with the irritant effect.

These effects may cause severe discomfort and be seriously disabling, as is the case with dyspnea or wheezing. The tearing, pain, and irritation associated with exposure of the eye to sensory irritants can be severe; in some cases, it is disabling. In addition to these primary effects, workers distracted by irritant effects are more likely than nonexposed workers to have accidents and thus to endanger both themselves and others. (Irritant effects thus also have substantial productivity impacts.)

The eye irritation caused by exposure to irritants is believed to result from stimulation of the sensory nerve endings. in the cornea. There is little information available on the relationship between the severity of the effect and the physical or chemical properties of the irritating substance. In addition; the mechanism of action underlying this irritant effect is not well understood. Mechanisms that have been suggested include physical action of the irritant on nerve endings, binding of the irritant to sulfhydryl groups of protein, inhibition of cellular respiration, and

cholinesterase inhibition (Grant 1986/ Ex. 1-975). The symptoms of eye irritation are usually transient and do not generally persist after cessation of exposure; however, exposure to concentrations of lacrimators that exceed the levels associated with transient eye irritation may produce corneal or conjunctival injury that requires medical treatment (Grant 1986/ Ex. 1-975).

Sensory irritation of the respiratory system primarily affects the upper respiratory tract and causes an increase in sputum production; inflammation of the nasal passages, trachea, and upper bronchial tree; and decreased cilial clearance. These effects produce a burning sensation in the nasal passages and throat; coughing; sneezing; and acute bronchitis. The development of bronchitis indicates that the cilial clearance mechanism has been compromised, and the accumulation of mucus that results increases the risk of secondary bacterial infection. Wheezing may also be apparent, particularly if the affected individual has a history of hyperreactive airway disease. If exposure is sufficiently intense, the irritant may reach the lower portion of the bronchial tree, causing a chemical burn of the parenchyma and the sudden collection of fluid in interstitial spaces and alveoli (pulmonary edema). Irritation-induced edema may have a delayed onset (12 hours or more) and can cause hypoxia and difficulty in breathing.

For the great majority of substances in this group, OSHA's current limits in construction and maritime are based on evidence showing that humans exposed to the chemical at a particular airborne

concentration will experience sensory irritation. For a few substances in this group, evidence from animal experiments provided the basis for limit setting. Several general types of evidence were used by OSHA in proposing to revise existing limits or to propose limits for substances previously unregulated in construction, maritime, or agriculture:

- · Consideration of new human evidence:
- · Reinterpretation of the human data that formed the basis for setting the 1970 TLV* in construction and maritime;
- Consideration of evidence from industrial experience showing that employees are not experiencing irritation; and
- · Evaluation of new evidence in animals.

The studies that provide the basis for most of the sensory irritant levels being proposed by OSHA today are generally controlled-exposure experiments that involved human volunteers or reports of adverse effects in workers.

Dose-Response Relationships and Sensory Irritation

Sensory irritation is considered a "threshold" phenomenon; that is, for any sensory irritant, there is an exposure concentration below which very few, if any, individuals will experience irritation. As exposure increases above this level, a larger proportion of exposed individuals will notice the effect and the effect will become increasingly severe. At some concentration above this noobserved-effect level (NOEL), all exposed persons will experience

sensory irritation, although the intensity of the response may vary.

The risk of experiencing irritation that is associated with exposures below the NOEL will be minimal (except in the hypersensitive individual), while the risk of experiencing the irritant effect will increase as exposure increases. At some point above the NOE level (i.e., at some dose of the substance) the response will be 100 percent, and all exposed persons will experience irritation. According to general toxicologic principles (see Section IV.A of this preamble), the shape of the curve that describes responses above the NOEL is sigmoidal, and the steepness of the curve is a function of the variability in individual responses to the particular irritant. For example, if nearly all persons exposed to the substance will experience a response at approximately the same concentration (dose), the curve will be steep; if, on the other hand, the percentage of people responding increases only slowly as concentration rises, the curve will be considerably

In addition to the relationship between increasing dose and increasing proportion of exposed persons being affected, the intensity of the response also increases with increasing exposure level. Slightly above the NOE level, affected individuals will experience itching and burning of the eyes, nose, and throat; this is a transient effect that disappears when exposure ceases. For some substances, workers may become inured to the sensations and higher exposure levels are necessary to elicit a subjective response. As exposure levels increase, the irritant effects become more severe, until they reach a point where objective signs of mucous membrane irritation are apparent (i.e., redness of the eyes, rhinitis, coughing, and lacrimation).

OSHA preliminarily concludes that exposure limits are needed for those substances for which PELs are being proposed in this rulemaking to protect workers in construction, maritime, and agriculture against sensory irritant effects that result in objective signs of irritation, such as coughing, wheezing, conjunctivitis, and tearing. Such levels of mucous membrane irritation may require medical treatment, adversely affect the well-being of employees, and place the affected individual at risk from increased absorption of the substance and decreased resistance to infection. Exposing workers repeatedly to irritants at levels that cause subjective irritant effects may cause workers to become inured to the irritant warning properties of these substances and thus increase

the risk of overexposure. In addition, the long-term effects of repeated low-level sensory irritation have not been well studied.

Analyses of human case reports and the toxicologic data for the substances in this group of chemicals are presented below. In addition, OSHA's preliminary findings in each case are discussed in detail.

ACETALDEHYDE
CAS: 75-07-0; Chemical Formula:
CH₃CHO
H.S. No. 1001

The current OSHA PEL for acetaldehyde in the construction and maritime industries is 200 ppm as an 8-hour TWA; there is currently no PEL for acetaldehyde in agriculture. The ACGIH TLV®-TWA for acetaldehyde is 100 ppm (180 mg/m³), with a STEL of 150 ppm (270 mg/m³); there is no NIOSH REL for this substance. OSHA is proposing an 8-hour TWA PEL of 100 ppm and a STEL of 150 ppm for acetaldehyde in the agriculture, construction, and maritime industries. These are the limits recently established for acetaldehyde in general industry.

Acetaldehyde is a flammable, colorless, fuming liquid with a pungent, fruity odor (Sax and Lewis 1989, p. 6; New Jersey Fact Sheet 1986, p. 1). Acetaldehyde is used in the production of herbicides, fungicides, and pesticides; in the production of rubber. disinfectants, cosmetics and perfumes; in the silvering of mirrors; in photography; in the manufacture of gelatin, glue, and casein products; as an additive in milk products and candies; and as a preservative in food products and leather [Merck 1983, p. 6; IARC 1986, p. 103; Parmeggiani 1983, p. 36; Hawley's 1987, p. 5; HSDB 1987). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Acetaldehyde is an irritant of the eyes, mucous membranes, and upper respiratory tract, a central nervous system depressant at high concentrations, and, in experimental animals, a carcinogen. The oral LD50 in rats is 1930 mg/kg, and the LCso in the same species is 37 g/m³ (20,550 ppm) for 30 minutes (RTECS 1990). Animals acutely poisoned by inhalation die of narcosis or pulmonary edema (Fairhall 1949). Cats exposed at a level of 1520 ppm acetaldehyde for 7 hours showed reversible irritation of the air passages (Iwanoff 1911). Instilled into the eyes of rabbits, acetaldehyde produced severe irritation; in contact with the skin of rabbits, this substance caused mild

irritation (RTECS 1990). Rats exposed to acetaldehyde concentrations of 4000 to 5000 ppm 6 hours/day, 5 days/week for 4 weeks showed varying degrees of degradation of the nasal epithelium (Appelman 1982). Hamsters exposed to a 4560-ppm concentration of acetaldehyde for 3 months showed signs of ocular and nasal irritation and had increased numbers of erythrocytes; at autopsy, increased kidney and heart weights and severe histopathological changes in the respiratory tract were seen in these animals (Kruysse 1975). In carcinogenicity bioassays, acetaldehyde was found to produce adenocarcinomas and squamous cell carcinomas of the nasal mucosa in rats and larvngeal carcinomas in hamsters by inhalation; in addition, acetaldehyde is both embryotoxic and teratogenic when, administered to rats and mice during pregnancy (IARC 1987, Suppl. 7, p. 77; IARC 1985, Vol. 36, p. 114). The International Agency for Research on Cancer (IARC) has concluded that the evidence for acetaldehyde's carcinogenicity in animals is sufficient (IARC 1987, Suppl. 7, p. 77).

Humans exposed to concentrations of 25 ppm or 50 ppm acetaldehyde for 15 minutes reported experiencing eve irritation, while those exposed to a 200ppm acetaldehyde concentration for 15 minutes reported transient conjunctivitis; exposure to a 134-ppm concentration of acetaldehyde for 30 minutes produced mild upper respiratory tract irritation in these volunteers (Silverman 1946; EPA 1983). Repeated or prolonged skin contact with acetaldehyde produces erythema, burns, and dermatitis as a result of primary irritation (Proctor, Hughes, and Fischman 1988, p. 47). Chronic exposure to higher concentrations (above 200 ppm) may injure the corneal epithelium and cause persistent lacrimation, photophobia, and the sensation of a foreign body in the eye (Halbertsma 1927; Silverman 1946). Chronic exposure to low levels of acetaldehyde is reported to have a narcotic effect on the central nervous system, producing bronchial secretions and symptoms similar to those of chronic alcoholism (Fairhall 1949). A study of workers at a German chemical plant who were primarily exposed to acetaldehyde but were also exposed to other chemicals reported an excess of bronchial tumors and tumors of the oral cavity in these workers. Because of mixed exposure, the small number of cases, and the poorly defined exposure population, the International Agency for Research on Cancer concluded that the evidence for the carcinogenicity of acetaldehyde in

humans is inadequate (IARC 1987,

Suppl. 7, p. 77).

CH3COOH

H.S. No. 1002

OSHA believes that employees in the construction and maritime industries are at significant risk of experiencing conjunctivitis and irritation at the concentration of acetaldehyde that is permitted by the current 8-hour TWA limit of 200 ppm in force in these sectors, and that workers in agriculture are at risk of these same effects because acetaldehyde concentrations in this sector may currently be uncontrolled. Therefore, OSHA is proposing that the PEL for acetaldehyde in the agriculture, construction, and maritime industries be set at 100 ppm as an 8-hour TWA and 150 ppm as a 15-minute STEL. Promulgation of these limits will also make OSHA's PELs for this substance consistent across all regulated sectors. ACETIC ACID CAS: 64-19-7; Chemical Formula:

The current OSHA PEL for acetic acid in the construction and maritime industries is 10 ppm as an 8-hour TWA; there is no PEL for acetic acid in agriculture. The ACGIH TLV*-TWA for acetic acid is 10 ppm (25 mg/m3) and the STEL is 15 ppm (37 mg/m3); there is no NIOSH REL for this substance. OSHA is retaining its 8-hour TWA PEL of 10 ppm in the construction and maritime industries and is proposing to establish this PEL in agriculture. The proposed action would make the PEL for acetic acid consistent across all OSHA-

Acetic acid is a clear, colorless, flammable liquid with a pungent odor (Sax and Lewis 1989, p. 16). This substance is used as a fungicide to preserve high-moisture grain and to combat Aspergillus flavus, the organism that produces aflatoxin (Grayson 1985, p. 9). Acetic acid is also used in the manufacture of acetic anhydride, cellulose acetate, vinyl acetate

regulated industry sectors.

monomer, and other chemicals; in the production of insecticides; as a food additive; and for many other purposes (Hawley's 1987, p. 7). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal

Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Acetic acid is a strong irritant of the eyes, skin, and upper respiratory tract in both animals and humans. In addition, exposure to high concentrations of this substance causes narcosis in experimental animals. The oral LD50 in rats is 3530 mg/kg, and the LC50 in mice is 5620 ppm for a 1-hour exposure (RTECS 1990). The dermal LD50 in

rabbits is 1060 mg/kg (RTECS 1990). Concentrated (glacial) acetic acid caused severe injury when applied to rabbit eyes (Smyth 1951), and contact of the skin with concentrated solutions (50 percent or more) caused moderate to severe burns in guinea pigs (Roudabush 1965). Mice exposed to acetic acid vapors at concentrations greater than 1000 ppm showed signs of irritation of the conjunctiva and upper respiratory tract; at autopsy, these animals exhibited hepatic swelling and visceral congestion (Ghiringhelli 1957). Guinea pigs exhibited minor changes in respiration after exposure to a 5-ppm concentration; exposure to 100 ppm produced a significant increase in pulmonary flow resistance and a decrease in breathing rate and minute volume, which suggests that bronchial constriction is the primary mode of action for acetic acid irritation (Amdur 1961/Ex. 1-601).

Unacclimatized humans have experienced extreme eye and nasal irritation at acetic acid concentrations above 25 ppm and conjunctivitis at concentrations below 10 ppm (Ghiringhelli 1957). A study of 5 workers exposed to acetic acid concentrations ranging from 80 ppm to peaks of 200 ppm for 7 to 12 years found chronic conjunctivitis, blackening and hyperkeratosis of the skin of the hands, chronic bronchitis and pharyngitis, and erosion of exposed teeth in these individuals (Ghiringhelli 1957; Parmeggiani and Sassi 1954).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers in agriculture who are exposed to acetic acid at the levels permitted by the absence of a limit are at significant risk of experiencing eye. mucous membrane, and skin irritation. OSHA is accordingly proposing an 8hour TWA of 10 ppm for this substance in agriculture; the Agency believes that this limit is necessary to reduce a significant risk of material health impairment. In addition, promulgation of this limit will make the PEL for acetic acid consistent across all regulated sectors.

ACETONE CAS: 67-64-1; Chemical Formula: CH3COCH3 H.S. No. 1004

OSHA's current PEL for acetone in the construction and maritime industries is 1000 ppm as an 8-hour TWA. There is no PEL for acetone in agriculture. The NIOSH recommended exposure limit (REL) for acetone is 250 ppm as a 10hour TWA. The ACGIH TLV®-TWA for acetone is 750 ppm (1780 mg/m3) and

1000 ppm (2380 mg/m3) as a 15-minute STEL. OSHA is proposing an 8-hour TWA PEL of 750 ppm, and a 15-minute STEL of 1000 ppm for acetone in the agricultural, construction, and maritime industries: these are the PELs recently promulgated for acetone in general industry.

Acetone is a colorless, highly volatile, flammable liquid with an aromatic odor (ACGIH 1986, p. 6). This substance is widely used as a solvent in paints. varnishes, and lacquers and in the leather and rubber industries. It is also used to clean and dry precision parts

(ACGIH 1986, p. 6).

Acetone is irritating to the eyes, skin, nose, and throat; at high concentrations, this substance is a central nervous system depressant in both animals and humans. The oral LD₅₀ in rats is 5800 mg/kg, the lowest lethal concentration in rats is 1600 ppm for 4 hours, and the dermal LD₅₀ in rabbits is 20 g/kg (RTECS 1990). Animals exposed to acetone concentrations above 1000 ppm develop corneal epithelial and conjunctival injury (Grant 1986, p. 41; Carpenter 1946). Exposure of rats to a concentration of 52,200 ppm for 1 hour caused narcosis and, at 126,600 ppm, death (Flury 1934). Rats exposed to acetone at concentrations between 3000 and 16,000 ppm for 4 hours/day for 10 days showed behavioral changes but developed some tolerance when repeatedly exposed (Golberg 1964). Rats exposed to 19,000 ppm acetate for 3 hours/day, 5 days/week for 8 weeks showed no toxic effects (Brucker 1978).

In humans, irritation of the eyes, nose, and throat has been reported at acetone concentrations of 500 ppm (Nelson 1943). and headaches and lightheadedness are experienced at concentrations above 1000 ppm (Raleigh 1972). At a 12,000ppm concentration of acetone, central nervous system depression severe enough to cause loss of consciousness may occur (Ross 1973). Workers exposed to an acetone concentration of 1000 ppm for 3 hours/day over a 7- to 15year period complained of respiratory tract irritation, dizziness, and weakness (Vigliani and Zurlo 1955).

In an early controlled-exposure experiment, Nelson, Enge, Ross, et al. (1943/Ex. 1-66) exposed an average of 10 human subjects (both male and female) to a variety of solvents, including acetone, for 3 to 5 minutes. Subjects were asked to judge the level of sensory irritation as absent, slightly irritating, or very irritating. Tests were conducted in a 1200-cubic-foot gas cabinet equipped with an anemostat to distribute the air uniformly. Acetone was reported to produce slight irritation

on exposure to 300 ppm, but exposure to a concentration of 500 ppm produced a degree of eye, nose, and throat irritation that was still described by a majority of the subjects as "tolerable."

Another controlled study on acetone's effects was conducted more recently by Matsushita, Yoshimune, Inoue et al. (1969/Ex. 1–191). In this study, the authors exposed 25 healthy male subjects to 0, 100, 250, 500, or 1000 ppm acetone. Subjects were exposed for 3 hours in the morning and 3 hours in the afternoon, with a 45-minute period between exposures. Irritant responses were scored on a scale from 0 to 12, with a score of 12 representing severe irritation.

Most of the subjects exposed to a 500or 1000-ppm acetone concentration reported experiencing irritation (graded between 4 and 5 in severity on an ascending severity scale of 1 to 10) during the first 90 minutes of exposure in the morning and the first 60 minutes of exposure in the afternoon. Subjects ceased to report irritation at the 90minute mark during the afternoon exposure. A lesser degree of irritation was reported to occur among subjects exposed to a 100- or 250-ppm concentration of acetone; however, this irritation subsided after the first 90 minutes of exposure in each of the two exposure periods. Subjects exposed to 250 ppm or a higher concentration reported feeling general weakness and a sense of tension even as long as 24 hours after exposure. Blood and urine samples taken during and after exposure showed increasing blood and urinary acetone levels among subjects exposed to 250 ppm or higher. Following the exposure period, these levels fell to normal values within about 25 to 35 hours after exposure was terminated. The authors also reported an increased leukocyte count in subjects exposed to 500 or 1000 ppm acetone; the increased white cell count persisted for about 24 hours after the cessation of exposure. The authors attributed this increased leukocyte count to acetone's irritant properties (Matsushita, Yoshimune, Inoue, et al. 1969/Ex. 1-191).

In addition to the two controlledexposure studies discussed above, two industry studies demonstrate acetone's irritant effects. One report by Parmeggiani and Sassi (1954/Ex. 1–759) indicated that six employees exposed to a 307- to 918-ppm concentration of acetone in a rayon acetate plant experienced eye and throat irritation, dizziness, and inebriation. Five of the employees showed objective signs of pharyngeal irritation, four had lung

irritation, and three had conjunctivitis. Although the authors attribute the observed CNS effects to excessive concomitant exposure to carbon disulfide, the irritant effects are more likely to have been the result of exposure to acetone, because carbon disulfide is not a primary irritant by vapor inhalation (Proctor, Hughes, and Fischman 1988). The other study, by Vigliani and Zurlo (1955/Ex. 1-164), found that acetone production workers exposed to a 700-ppm concentration of acetone for 3 hours daily for 7 to 15 years experienced inflammation of the respiratory tract, stomach, and duodenum; giddiness; and loss of strength.

To summarize, OSHA believes that the studies discussed above show that acetone is capable of producing sensory irritation at concentrations below 1000 ppm and that long-term exposure to acetone at levels below 1000 ppm can cause CNS disturbances. In addition, the ACGIH (1986/Ex. 1-3, p. 6) reports that chronic exposure to acetone causes respiratory irritation and headaches. Therefore, OSHA concluded in the general-industry air contaminants rulemaking that the findings of these four studies (Nelson, Enge, Ross, et al. 1943/Ex. 1-66; Matsushita, Yoshimune, Inoue, et al. 1969/Ex. 1-191; Parmeggiani and Sassi 1954/Ex. 1-759; Vigliani and Zurlo 1955/Ex. 1-164) were consistent in demonstrating that acute and long-term effects of acetone exposure occur at levels below 1000 ppm. OSHA therefore believes that it is necessary to reduce the limit for acetone to 750 ppm as an 8hour TWA and 1000 ppm as a STEL to protect workers in construction, maritime, and agriculture from the acute and chronic effects of acetone exposure. These are the limits recently established for acetone in general industry. OSHA preliminarily finds that the chemically induced sensory irritation associated with acute exposures to acetone can occur at levels only slightly above the 750-ppm level being established as an 8hour TWA. In the absence of a STEL, the 750-ppm limit would permit excursions to levels as high as 12,000 ppm for brief periods. Such levels "depress the central nervous system, causing dizziness, weakness, and loss of consciousness" (Proctor, Hughes, and Fischman 1988). An 8-hour TWA of 750 ppm is necessary to protect workers against the bioaccumulation of acetone, chronic irritation of the respiratory tract, and headaches associated with longterm acetone exposures. In addition, promulgation of these PELs will make OSHA's limits for acetone consistent across all regulated sectors.

ACROLEIN
CAS: 107-02-8; Chemical Formula:
CH₂ = CHCHO
H.S. No. 1007

The current OSHA 8-hour TWA PEL for acrolein in the construction and maritime industries is 0.1 ppm. There is no PEL for acrolein in agriculture. The ACGIH TLV*-TWA for acrolein is 0.1 ppm (0.23 mg/m3) and the TLV*-STEL is 0.3 ppm (0.69 mg/m3). There is no NIOSH REL for acrolein. OSHA is retaining its 0.1 ppm 8-hour TWA limit in construction and maritime, proposing to add a STEL of 0.3 ppm in these sectors, and additionally proposing to extend both limits to agriculture. Adoption of the proposed limits will achieve consistency in the exposure limits for acrolein across all OSHAregulated industry sectors.

Acrolein is a colorless or yellowish flammable liquid with a disagreeable, choking odor (ACGIH 1986, p. 11).

Acrolein is used in the production of poultry feed protein supplements (Sittig 1985, p. 28); to control the growth of algae and aquatic weeds (Grayson 1985, p. 22); and is released during welding, during heat cracking of animal and some vegetable fats, and by the operation of internal combustion engines in confined spaces (Parmeggiani 1983, p. 50).

Acrolein is acutely toxic to both animals and humans and is highly irritating to the eyes, skin, and respiratory tract. The LC50 in rats is 300 mg/m3 for 30 minutes, and the dermal LD50 in rabbits is 562 mg/kg (RTECS 1990). In early inhalation studies in cats (Iwanoff 1911), exposure to 10 ppm acrolein for 3.5 hours was found to cause only transient effects, including salivation, lacrimation, respiratory irritation, and mild narcosis. However, later studies reported that an exposure to 1 ppm of acrolein produced marked nose and eye irritation in 5 minutes or less (Cook 1945/Ex. 1-726). Over longer periods, studies have demonstrated fatalities in one of six rats exposed for 4 hours to airborne concentrations of acrolein at 8 ppm; at 16 ppm, the mortality was 100 percent (Smyth 1956/ Ex. 1-759). Irritation of the upper respiratory tract is the primary symptom of acrolein inhalation, but lung edema can occur after exposure to high concentrations (Henderson and Haggard 1943a/Ex. 1-881). In addition, skin contact with acrolein causes skin burns and severe injury to the cornea in experimental animals (Smyth 1956/Ex. 1-759). Thirty-two of 57 male rats died following exposure to a 4-ppm concentration of acrolein for 6 hours per day for up to 62 days; bronchiolar necrosis and focal pulmonary edema

were noted in these animals at autopsy (Kutzman 1985).

Exposure of humans to high concentrations of acrolein causes tracheobronchitis and pulmonary edema, and the irritation threshold in humans is 0.25 ppm for 5 minutes (Beauchamp 1985). Human fatalities have been reported at acrolein levels as low as 10 ppm, and exposure to a 150-ppm concentration was lethal after 10 minutes (Henderson 1943; Prentiss 1937). In humans, skin contact caused irritation, erythema, and edema; splashed into the eye, acrolein caused blepharoconjunctivitis, lid edema, discharge, and corneal injury (Champeix 1967).

Based on this evidence in humans and animals, OSHA is retaining its current 0.1 ppm TWA limit in construction and maritime, proposing to extend the same 8-hour TWA limit to agriculture, and proposing to add a STEL of 0.3 ppm for acrolein that applies to all OSHAregulated sectors. OSHA believes that these limits are necessary to protect employees in the agricultural, construction, and maritime industries from the exposure-related effects associated with acrolein, which include eye, nose, and severe pulmonary irritation. OSHA considers these effects material health impairments within the mean of the Act. In addition. promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

ALLYL ALCOHOL CAS: 107-18-6; Chemical Formula: CH₂=CHCH₂OH H.S. No. 1010

The current OSHA PEL for allyl alcohol in the construction and maritime industries is 2 ppm as an 8-hour TWA, with a skin notation. There is no PEL for allyl alcohol in agriculture, and there is no NIOSH REL for this substance. The ACGIH TLV®-TWA for allyl alcohol is 2 ppm (4.8 mg/m3), with a STEL of 4 ppm (9.5 mg/m3) and a skin notation. OSHA is proposing to retain the 2-ppm 8-hour TWA PEL for allyl alcohol in the construction and maritime industries, to extend this 8-hour TWA limit to agriculture, and to add a STEL of 4 ppm for all sectors. These are the limits recently established for allyl alcohol in general industry.

Allyl alcohol is a colorless liquid with a pungent, mustard-like odor (Merck 1983, p. 44). Allyl alcohol is used as a fungicide, herbicide, and nematocide (Proctor and Hughes 1978, p. 93), in the refining and dewaxing of mineral oil (NIOSH/OSHA Occupational Health Guideline 1981, p. 3), and in many chemical manufacturing processes

(Parmeggiani 1983, p. 128). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Allyl alcohol is highly toxic to both animals and humans; it causes lacrimation and is severely irritating to the eyes, skin, and respiratory tract. Allyl alcohol is readily absorbed through the skin (the dermal LD50 in rabbits is 45 mg/kg). The LC50 in rats is 76 ppm for an 8-hour exposure (RTECS 1990). Animals exposed to a 500-ppm concentration of allyl alcohol for 1 hour survived, while those exposed to 1000 ppm for 1 hour died (Smyth 1948). Postmortem examination of rabbits exposed to a 1000-ppm concentration of allyl alcohol for 3 to 4 hours showed hemorrhages of the eyes, histologic changes in retinal ganglion cells, and severe damage and hemorrhage in practically all body tissues (McCord 1932, as cited in ACGIH 1986).

Repeated exposure of 10 rats to a 60ppm concentration for 7 hours/day caused gasping during the first few exposures, persistent eye irritation, and the death of one rat (Dunlap 1958, as cited in Proctor, Hughes, and Fischman 1988, p. 62). Exposure of dogs, rats, rabbits, and guinea pigs to 7 ppm for 7 hours/day for 6 months resulted in focal necrosis of the liver and necrosis of the convoluted tubules of the kidneys. In mice, administration of allyl alcohol also produced liver necrosis, as well as marked hemolysis and depletion of erythrocyte glutathione (Ferrali et al. 1989). Exposure of animals to airborne concentrations of allyl alcohol produced a sensory irritant effect, and a concentration of 3.9 ppm was sufficient to decrease the respiratory rate in mice by 50 percent (Neilsen et al. 1984).

In humans, the most important adverse effects of occupational exposures to allyl alcohol are upper respiratory tract irritation and burns of the eyes. In a controlled human sensory response study (Dunlap, Kodama, Wellington, et al. 1958/Ex. 1-630), a 5minute exposure to 25 ppm resulted in severe eye irritation. Milder irritation has been reported to occur at 5 ppm (McCord 1932, as cited in ACGIH 1986/ Ex. 1-3, p. 18). Necrosis of the cornea and temporary blindness occurred in one individual exposed to allyl alcohol at a level irritating to the eyes and nose (Smyth 1956/Ex. 1-759). Skin absorption may lead to serious systemic injury (visceral congestion, periportal congestion of the liver, hematuria, and nephritis); in addition, when evaporation from the skin is prevented or reduced, skin contact with allyl

alcohol causes burns (ACGIH 1986/Ex. 1-3, p. 18).

In reviewing the evidence for allyl alcohol, OSHA notes that severe eye irritation has been reported to occur in human subjects exposed to 25 ppm for as short an interval as 5 minutes (Dunlap, Kodama, Wellington, et al. 1958/Ex. 1-630); such an exposure would be permitted under the current limit in construction and maritime of 2 ppm as an 8-hour TWA. OSHA also notes that short-term exposure to allyl alcohol produces characteristic effects more severe than those caused by other sensory irritants; these effects include photophobia and blurred vision. The Agency believes that a STEL is necessary to prevent these effects in exposed workers.

To protect workers in maritime, construction, and agriculture from the significant health risks associated with exposure to allyl alcohol, the Agency is retaining the 8-hour TWA PEL of 2 ppm in construction and maritime, proposing a 4-ppm 15-minute STEL in construction and maritime, and proposing both limits in agriculture along with a skin notation. Promulgation of these limits will make the PELs for allyl alcohol consistent across all OSHA-regulated sectors.

ALLYL GLYCIDYL ETHER
CAS: 108–92–3; Chemical Formula:
C₆H₁₀O₂
H.S. No. 1012

OSHA's current PEL for allyl glycidyl ether (AGE) in the construction and maritime industries is 10 ppm (45 mg/ m³) as a ceiling limit. There is no PEL for AGE in agriculture. The ACGIH TLV*-TWA for AGE is 5 ppm (23 mg/ m3), with a STEL of 10 ppm (47 mg/m3) and a skin notation. The NIOSH REL for AGE is 9.6 ppm (45 mg/m3) as a 15minute ceiling. OSHA is proposing to retain the 8-hour TWA PEL of 5 ppm in construction and maritime, to extend this limit to agriculture, and to add a STEL of 10 ppm for AGE in the agricultural, construction, and maritime industries. These are the limits recently established for this substance in general industry.

Allyl glycidyl ether is a colorless liquid of characteristic, but not unpleasant, odor (ACGIH 1986, p. 20). This substance is used as a resin intermediate and as a stabilizer for vinyl resins and rubber (ACGIH 1986, p. 20).

Allyl glycidyl ether is irritating to the eyes, skin, and respiratory tract; it is also a skin sensitizer and may produce systemic toxicity. The LC₅₀ in rats is 860 ppm for a 4-hour exposure (RTECS 1990). Rats exposed to a 600-ppm concentration of AGE for 8 hours/day

exhibited irritation of the eyes and respiratory tract, as well as corneal opacities. At necropsy, examination revealed pulmonary inflammation, bronchiectasis, and bronchopneumonia. Rats exposed to 260 ppm showed slight irritation of the eyes and respiratory distress (Hine et al. 1956; Hine and Rowe 1962, as cited in ACGIH 1986). Mice exposed for 4 days to 7.1 ppm AGE developed epithelial necrosis of the nasal turbinates and complete erosion of the olfactory epithelium. Squamous metaplasia of the respiratory epithelium was also observed in mice exposed to 7.1 ppm AGE for 9 days (Gaqnaire et al. 1987, as cited in HSDB). In mice, a 5.7ppm concentration of AGE was found to decrease the respiratory rate by 50 percent (Gagnaire et al. 1987).

Exposure of animals to AGE has also been shown to produce a variety of adverse systemic effects. Exposure of rats to a 300 ppm concentration for 7 hours/day for 50 days produced testicular atrophy (Hine et al. 1956; Hine and Rowe 1962). Testicular degeneration, along with cytotoxic effects on bone marrow cells, has also been observed in rats administered 400 mg/kg/day AGE by intramuscular injection (NIOSH 1978). In a recentlycompleted NTP bioassay, AGE was found to cause olfactory tumors in rats and mice exposed to 10 ppm for 6 hours/ day for 2 years (NTP 1990, as cited in RTECS 1990).

In limited human exposure studies, AGE has been demonstrated to cause dermatitis and eye irritation (Hine, Kodama, Wellington et al. 1956/Ex. 1–331). In humans, skin sensitization occurs readily (Hine and Rowe 1963a, as cited in ACGIH 1986/Ex. 1–3, p. 20). In addition to primary irritation and sensitization, the potential exists for cross-sensitization with other epoxy agents (ACGIH 1986/Ex. 1–3, p. 20).

Based on this evidence in humans and animals, OSHA is proposing to make the PELs for allyl glycidyl ether consistent across all industry sectors by extending an 8-hour TWA PEL of 5 ppm to the agriculture sector and by adding a 10-ppm STEL to the limits that apply in all sectors. OSHA preliminarily concludes that these combined limits will reduce the significant risks of sensitization and primary irritation to which workers in these sectors could otherwise be exposed. In addition, promulgation of these PELs will make OSHA's limits consistent across all regulated sectors.

ALLYL PROPYL DISULFIDE

CAS: 2179-59-1; Chemical Formula:

CH₂ = CHCH₂S₂C₃H₇

H.S. No. 1013

The current OSHA PEL for allyl propyl disulfide in the construction and maritime industries is 2 ppm (12 mg/m 3) as an 8-hour TWA. There is no PEL for allyl propyl disulfide in agriculture. The ACGIH TLV*-TWA for this substance is 2 ppm (12 mg/m 3), with a 3 ppm (18 mg/ m 3) STEL. There is no NIOSH REL for allyl propyl disulfide. OSHA is retaining its 2-ppm TWA limit for allyl propyl disulfide in construction and maritime, extending this limit to the agricultural sector, and adding a 3-ppm STEL for all sectors. These are the limits recently established for this substance in general industry.

Allyl propyl disulfide is a liquid with a pungent, irritating odor; it is the chief volatile constituent of onion oil (ACGIH 1986, p. 20). Nearly all occupational exposures to allyl propyl disulfide occur in the processing of onions and onion products and in the processing of foods using the substance as a flavoring.

There are no toxicity data in animals for this substance. Allyl propyl disulfide's irritative effects on the human eyes, nose, and upper respiratory tract are well recognized. The most severe irritation effects have occurred when workers were exposed to allyl propyl disulfide in the vicinity of onion slicing machines, where average concentrations of 3.4 ppm have been measured (Feiner, Burke, and Baliff 1946/Ex. 1-804). Administration of allyl propyl disulfide to six normal human volunteers after a 12-hour fast caused a significant fall in blood glucose levels and a significant rise in serum insulin levels during the subsequent 4 hours (Augusti 1975).

OSHA believes that a PEL of 2 ppm is necessary to protect workers in agriculture from this substance's irritant effects and that a STEL of 3 ppm is necessary to prevent employees in agriculture, maritime, and construction from being exposed to short-term concentrations of allyl propyl disulfide of sufficient magnitude to cause severe irritant effects. The Agency preliminarily concludes that the TWA and STEL limits together will protect workers in these sectors from experiencing these significant risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

AMMONIA

CAS: 7664-41-7; Chemical Formula: NH₃ H.S. No. 1021

OSHA's current exposure limit for ammonia in the construction and maritime industries is 50 ppm as an 8hour TWA. There is no PEL for ammonia in agriculture. The ACGIH TLV*-TWA

for ammonia is 25 ppm (17 mg/m³) with a STEL of 35 ppm (24 mg/m³). The NIOSH REL for ammonia is 50 ppm (34.8 mg/m³) as a 5-minute ceiling. OSHA is proposing a limit of 35 ppm as a 15-minute STEL in the agricultural, construction, and maritime industries. This is the limit recently established for ammonia in general industry.

Ammonia is a colorless gas with a strongly penetrating pungent odor (Sittig 1985, p. 71). It may occur as a clear liquid or as a gas, and is often supplied in pressurized cylinders (Genium MSDS 1985, No. 1). Ammonia is used as a fertilizer for direct application to fields in the anhydrous compressed gas form, as a feedstock in the manufacture of fertilizers and other chemical substances, and as a refrigerant (Grayson 1985, p. 94, Parmeggiani 1983, p. 149).

Ammonia is a severe irritant of the eyes, respiratory tract, and skin. The LC50 in rats is reported to be 2000 ppm for a 4-hour exposure (RTECS 1990). The toxic effects of ammonia appear to be restricted to its irritant properties. Postmortem examination of cats and rabbits exposed to 9700 ppm for 1 hour showed severe effects on the upper respiratory tract as well as alveolar congestion, hemorrhage, emphysema, and edema (Boyd et al. 1944, as cited in Clayton and Clayton 1982, p. 3048). Longer-term exposure to lower concentrations produces irritant effects in animals, but no other systemic effects. For example, exposure of several species of animals to 215 or 1100 ppm for 8 hours per day, 5 days per week for six weeks produced no gross or histopathologic changes (Coon 1970, as cited in Clayton and

Clayton 1981, p. 3048). In humans, accidental exposure to high concentrations of ammonia (in the range of 2500 to 6000 ppm) has caused several deaths, with the victims developing chemical pneumonitis; burns of the eyes, face, and mouth; and severe local edema (Proctor, Hughes, and Fischmann 1988, p. 71; NIOSH 1974). At lower concentrations, ammonia gas is severely irritating to the eyes, upper respiratory tract, and moist skin. Exposure to levels in the range of 30 to 50 ppm for 10 minutes causes mild to moderate eye and upper respiratory tract irritation (MacEwen 1970, as cited in Clayton and Clayton 1982, p. 3049).

An unpublished study conducted by the Detroit Department of Health and cited by the ACGIH (1986/Ex. 1-3, p. 27) reports that ammonia concentrations in the range of 20 to 25 ppm elicited complaints of discomfort from workers engaged in blueprinting and copying operations. In addition, a study of pigs conducted by Stombaugh et al. (1969) appeared to demonstrate that exposure to ammonia also causes systemic effects. The ACGIH established both a full-shift TLV*-TWA of 25 ppm to protect against ammonia's chronic effects and a TLV*-STEL of 35 ppm to protect against ammonia's irritant effects.

OSHA also reviewed NIOSH's recommended 5-minute ceiling limit for ammonia of 50 ppm. When making this recommendation, NIOSH relied on several reports that ammonia concentrations as low as 50 ppm are moderately irritating (Vigliani and Zurlo 1955/Ex. 1-164; Mangold 1971; Industrial Bio-test Laboratories 1973, all as cited in NIOSH 1974a/Ex. 1-238; MacEwen, Theodore, and Vernot 1970/Ex. 1-827; Pagnotto 1973, as cited in ACGIH 1986/ Ex. 1-3, p. 27). NIOSH concluded that the "irritating or annoying effects * * * [of exposure to ammonia are] more dependent upon concentration than length of exposure," and that "a standard expressed as a time-weighted average is inappropriate since it would permit fluctuations to concentrations considerably higher than 50 ppm" (NIOSH 1974a/Ex. 1-238, p. 69). In the rulemaking for general industry, OSHA concluded that NIOSH's recommended 50-ppm ceiling limit was above the effect level reported in the Detroit Department of Health studies (1965-1970, as cited in ACGIH 1986/Ex. 1-3, p. 27) for sensory irritation. This view is supported by Proctor, Hughes, and Fischman (1988, p. 71), who report that even 5-minute exposures to 32 ppm caused nasal dryness in 10 percent of exposed volunteers and that 5-minute exposures to 50 ppm ammonia caused nasal irritation and dryness in 20 percent of exposed volunteers.

In the rulemaking for general industry, some rulemaking participants expressed the opinion that OSHA's current 50 ppm TWA PEL was adequate because exposed workers become acclimated to the irritant effects of ammonia. OSHA is concerned with this view of acclimatization because the long-term consequences of a continual assault on the sensory nerves are not known. In addition, acclimatization lessens the ability of workers to discern airborne concentrations of other hazardous materials.

Based on this evidence, OSHA is proposing a 15-minute STEL of 35 ppm in the agricultural, construction, and maritime industries to protect workers against this substance's irritant effects, which have been demonstrated to occur at and below 50 ppm. OSHA preliminarily concludes that the eye and

upper respiratory tract irritation associated with ammonia exposure constitute material impairments of health and pose a significant risk to exposed workers in construction, maritime, and agriculture. Promulgation of this limit will also make OSHA's PEL for ammonia consistent across all regulated sectors.

AMMONIUM CHLORIDE (FUME) CAS: 12125–02–9 Chemical Formula:

NH₄C₁ H.S. No. 1022

There is no OSHA PEL for ammonium chloride fume in the agricultural, construction, or maritime industries. The ACGIH TLV*-TWA for this substance is 10 mg/m³ and the TLV*-STEL is 20 mg/m³. There is no NIOSH REL for this substance. OSHA is proposing a PEL of 10 mg/m³ as an 8-hour TWA and a STEL of 20 mg/m³ for ammonium chloride fume in the agricultural, construction, and maritime industries. These are the limits recently established for this substance in general industry.

Ammonium chloride is a white crystalline solid; fumes of this substance are evolved during galvanizing applications (ACGIH 1986, p. 28). Ammonium chloride is used in the manufacture of other ammonia compounds, in fertilizers, as a pickling agent in galvanization, in soldering flux, in melt-retarding snow treatment, and in urea formaldehyde products, (Hawley's 1987, p. 66).

Ammonium chloride fume is an irritant of the eyes, skin, and respiratory tract. The oral LD₅₀ in rats is 1650 mg/kg (RTECS 1990). Instilled into rabbit eyes, ammonium chloride causes varying degrees of irritation, ranging from mild to severe (RTECS 1990). In mice, intravenous administration of ammonium chloride caused hyperventilation and clonic movements, followed in some cases by convulsions or coma (Warren and Schenker, 1960; Gosselin, Smith, and Hodge 1984, pp. III–23, 26).

In humans, exposure to ammonium chloride causes irritation of the eyes, nose, and throat. Repeated contact of this substance with the skin may cause dermatitis (Genium MSDS 1991). Welders exposed to ammonium chloride in welding fumes may develop asthma (Genium MSDS 1991).

OSHA believes that, in the absence of any limit on airborne exposure, employees in the maritime, construction, and agriculture industries are at significant risk of experiencing respiratory irritation as a result of exposure to high concentrations of ammonium chloride fume. OSHA preliminarily concludes that the

proposed 8-hour TWA limit of 10 mg/m³ and a 15-minute STEL of 20 mg/m³ for ammonium chloride fume in the agricultural, construction, and maritime industries will substantially reduce these risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

n-AMYL ACETATE
CAS: 628-63-7; Chemical Formula:
CH₃COOC₅H₁₁
H.S. No. 2005

In general industry, construction, and maritime, OSHA's current permissible exposure limit for n-amyl acetate is 100 ppm as an 8-hour TWA. There is no current limit in agriculture. The ACGIH has a TLV*-TWA of 100 ppm (532 mg/m³) for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL of 100 ppm for n-amyl acetate in agriculture. This is the limit recently established in general industry.

n-Amyl acetate is a colorless liquid with a pear- or banana-like odor. This substance is used as a solvent for lacquers, paints, artificial leather, cements, and photographic film, and in the manufacture of phosphors in fluorescent lamps. n-Amyl acetate also finds use in printing and finishing fabrics; as a weevil attractant; as a flavoring agent; as an anti-inflammatory agent; as a warning odorant; as a partition solvent in penicillin manufacture, and in research (ACGIH 1986, p. 29; Hawley's 1987, p. 74; AIHA 1978; Clayton and Clayton 1981, p. 2278).

n-Amyl acetate is an irritant of the eyes, skin, and respiratory tract and causes narcosis, anesthesia, and liver damage at high concentrations. The oral LD50 in rats is 6500 mg/kg, and the lowest lethal concentration in the same species is 5200 ppm (length of time not specified) (RTECS 1990). The dermal LD₅₀ in rabbits is 20 ml/kg (Smyth 1962). Much of the toxicological literature does not distinguish between the isomers of amyl acetate; however, all of the industrially important pentyl acetate isomers (i.e., n-amyl, iso-amyl, and secamyl acetate) produce similar toxicological effects (AIHA 1978; Pagnotto 1964). A group of six rats exposed to a 5200-ppm concentration of technical amyl acetate (principally the n-amyl acetate isomer) died after 8 hours of exposure (Smyth 1962). At autopsy, guinea pigs exposed to amyl acetate concentrations of between 9200 and 18,000 ppm for 30 minutes had congestion of the brain, lungs, liver, and kidneys; exposure to 2000 ppm for 30 minutes caused no pathological effects (Clayton and Clayton 1981, p. 2278).

Rabbits exposed to high concentrations of amyl acetate showed signs of liver damage (elevated serum enzymes); at autopsy, histopathological changes were seen in the liver cells (Querci and Mascia 1970). In standardized testing on rabbit eyes, amyl acetate was graded 2 (slightly injurious) on a scale of 1 to 10 (Smyth 1962). Amyl acetate has a defatting action on the skin, and prolonged contact may cause irritation (Smyth 1962). A recent study (Ballantyne, Tyler, and Auletta 1986) suggests that amyl acetate is a skin sensitizer.

Humans exposed to a 1000-ppm concentration of amyl acetate for 30 minutes experienced irritation of the eyes, nose, and throat, as well as headache, fatigue, and excessive salivation (Sax 1975). Exposure to a 200ppm concentration of isoamyl acetate for 30 minutes is irritating to the human eye (Sandmeyer and Kirwin 1981, p. 2774). Exposure to higher concentrations of amyl acetate caused a burning sensation and hyperemia of the conjunctiva but no corneal damage (Flury and Zernik 1931; Patty 1949). Case reports of workers exposed to amyl acetate indicate that, in addition to irritation, exposure to the solvent causes liver injury, gastrointestinal disturbances, and blood changes (Browning 1953; Lehman and Flury 1943). A plumber using methyl-cellulose paint (containing mixed isomers of amyl acetate) in a small, unventilated room for several hours developed headache. nausea, and vomiting within a few hours, followed a few days later by orthopnea and paroxysmal nocturnal dyspnea, edema, and enlargement of the heart. The patient recovered completely in 6 months (Weissberg and Green 1979). Workers exposed chronically to amyl acetate showed upper respiratory and neurological effects (Zaikov and Babev 1978).

Based on this evidence in humans and animals, OSHA is proposing an 8-hour TWA PEL of 100 ppm for n-amyl acetate in agriculture; adoption of the proposed limit would establish the same PEL for workplaces in all OSHA-regulated industry sectors. The Agency preliminarily concludes that occupational exposure to n-amyl acetate causes irritation of the eyes, skin, and respiratory tract, and, at high concentrations, narcosis and liver damage. Accordingly, OSHA believes that, in the absence of a permissible exposure limit, workers in agriculture are potentially at significant risk for these exposure-related effects and that the proposed PEL will substantially reduce these risks.

BENZOYL PEROXIDE
CAS: 94-36-0; Chemical Formula:
(C₆H₈CO)₂O₂
H.S. No. 2017

In general industry, construction, and maritime, OSHA's current permissible exposure limit for benzoyl peroxide is 5 mg/m³ as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 5 mg/m³ for this substance; the NIOSH REL for benzoyl peroxide is 5 mg/m³ as a 10-hour TWA. OSHA is proposing an 8-hour TWA PEL of 5 mg/m³ for benzoyl peroxide in agriculture. This is the limit recently established for this substance in general industry.

Benzoyl peroxide is used as a bleaching agent for flour, fats, oils and waxes; as a drying agent for unsaturated oils; in the production of cheese; as a polymerization catalyst in the plastics industry; as a burnout agent for acetate yarns; for embossing vinyl flooring; and in the pharmaceutical and cosmetic industries (Hawley's 1987, p. 134; ACGIH 1986, p. 54). This substance is a flammable and explosive white, granular, crystalline solid. It is tasteless and has a slight almond-like odor resembling that of benzaldehyde (IARC 1985, p. 267; ACGIH 1986, p. 54).

Benzoyl peroxide is an irritant of the eyes, mucous membranes, and skin in both humans and animals. The oral LDso in rats is 7710 mg/kg (RTECS 1990). Eye squint, difficulty in breathing, salivation, lacrimation, erythema, and an increase followed by a decrease in motor activity were exhibited by rats during a 4-hour exposure to 24.3 mg/L of 78 percent benzoyl peroxide. All rats observed at 24 and 48 hours post-exposure had returned to normal in appearance (Proctor, Hughes, and Fischman 1988, p. 95). Benzoyl peroxide also causes both primary irritation and sensitization dermatitis (Proctor, Hughes, and Fischman 1988, p. 94; Cralley and Cralley 1985, p. 159). Humans exposed to benzoyl peroxide dust at a concentration of 12.2 mg/m3 (for an unspecified time) experienced pronounced irritation of the nose and throat. Similar exposure to concentrations of benzoyl peroxide dust ranging from 1.34 to 5.25 mg/m³ caused no irritation (ACGIH 1986, p. 54). Benzoyl peroxide lotion applied to the face of two people for acne treatment caused both facial erythema and edema, and patch tests with benzoyl peroxide were positive in these individuals (Proctor, Hughes, and Fischman 1988, p.

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to benzoyl peroxide at levels permitted by the absence of a limit are at significant risk of experiencing irritation of the eyes, mucous membranes, and skin as well as sensitization dermatitis. The Agency believes that establishing a PEL of 5 mg/m³ as an 8-hour TWA will protect agricultural workers from these significant risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. BENZYL CHLORIDE

CAS: 100–44–7

H.S. No. 2018; Chemical Formula: C₆H₅CH₂Cl

In general industry, construction, and maritime, OSHA currently has an 8-hour TWA limit of 1 ppm for benzyl chloride. The Agency has no PEL for this substance in agriculture. The ACGIH TLV*-TWA for benzyl chloride is 1 ppm as an 8-hour TWA; the NIOSH REL is a 15-minute ceiling of 5 mg/m³ (equivalent to a 15-minute STEL of 1 ppm). OSHA is proposing an 8-hour TWA PEL of 1 ppm for benzyl chloride in agriculture. This is the limit recently established for this substance in general industry.

Benzyl chloride is a clear, colorless liquid that has an unpleasant, pungent odor that is detectable at 0.047 ppm (Genium MSDS 1986, No. 583). Benzyl chloride is used in the manufacture of many different products: dyes, plasticizers, gasoline additives, tanning agents, cosmetics, resins, benzyl compounds, pharmaceuticals, and photographic developers (Hawley's 1987, p. 135; ACGIH 1986, p. 55; Parmeggiani 1983, p. 262).

Benzyl chloride is a powerful lacrimator and an irritant of the eves. mucous membranes, and upper respiratory tract. This substance is also a carcinogen and reproductive toxin in animals (IARC 1987, p. 148; RTECS 1990). The oral LDso in rats is 1231 mg/ kg, and the LCso in the same species is 150 ppm for 2 hours (RTECS 1990). Rabbits and cats exposed to a 95-ppm concentration of benzyl chloride for 8 hours/day for 6 days showed signs of eye and respiratory tract irritation (ACGIH 1986, p. 55). This substance is a strong skin sensitizer in guinea pigs (HSDB 1985). Benzyl chloride has been tested for carcinogenicity in mice by skin application and in rats by subcutaneous injection. Injection-site sarcomas were observed in rats, and some mice developed skin carcinomas (IARC 1987, p. 148). Skin painting tests in female mice produced squamous-cell carcinomas of the skin (IARC 1987, p. 148). When this substance was administered to mice and rats by

gavage, mice of both sexes developed statistically significant increases in the incidence of papillomas and carcinomas of the forestomach; in female rats only, the incidence of thyroid C-cell tumors was also increased (IARC 1987, p. 148). Based on this evidence, the International Agency for Research on Cancer concluded that the evidence for the carcinogenicity of benzyl chloride in animals is sufficient (IARC 1987, p. 148). When administered to mice intraperitoneally or subcutaneously. benzyl chloride caused paternal reproductive effects (RTECS 1990). Benzyl chloride is mutagenic, with and without metabolic activation, in bacterial and mammalian test systems (RTECS 1990).

In humans, exposure to benzyl chloride causes immediate lacrimation (Proctor, Hughes, and Fischman 1988, p. 95). Splashed into the eye, the liquid causes corneal damage; in contact with the skin, it produces dermatitis (Proctor, Hughes, and Fischman 1988, pp. 95-96). Workers exposed to a 2-ppm concentration reported feeling irritable and weak and had headaches; a 1minute exposure to a 16-ppm concentration was described as intolerable (Proctor, Hughes, and Fischman 1988, p. 95). There is an unconfirmed report that some benzyl chloride-exposed workers have experienced disturbances in liver function and mild leukopenia (Proctor, Hughes, and Fischman 1988, p. 95). There are two studies of workers exposed to benzyl chloride and other chlorinated toluenes (in Japan and the United Kingdom) that show excesses in the number of cases of respiratory tract and digestive system cancers in these workers. However, the International Agency for Research on Cancer concluded that these data are too limited to permit any differential risk estimation to be made for benzyl chloride (IARC 1987, p. 148).

The evidence described above shows that benzyl chloride exposure causes immediate and severe irritation of the eyes, mucous membranes, upper respiratory tract, and skin, as well as cancer and reproductive effects in animals. Accordingly, OSHA believes that, in the absence of a limit, workers in agriculture are potentially at significant risk of experiencing these exposure-related effects. The Agency believes that the proposed limit of 1 ppm for benzyl chloride is necessary to substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

BORATES, TETRA, SODIUM SALTS (ANHYDROUS, PENTAHYDRATE, AND DECAHYDRATE)

CAS: 1303-96-4 (Decahydrate); Chemical Formula: Na₂B₄O₇ 10H₂O 1330-43-4 (Anhydrous); Chemical Formula: Na₂B₄O₇

12179-04-3 (Pentahydrate); Chemical Formula: Na₂B₄O₇ 5H₂O H.S. Nos. 1036, 1038, and 1037

OSHA has no exposure limits for the anhydrous or hydrated (penta- or decahydrate) forms of sodium tetraborate in the agricultural, construction, and maritime industries. The ACGIH TLV®-TWAs for these substances are 1 mg/m3 for the anhydrous and pentahydrate forms of sodium tetraborate and 5 mg/m3 for the decahydrate form. There is no NIOSH REL for these substances. OSHA is proposing a 10 mg/m3 8-hour TWA limit for all forms of the sodium tetraborates in the agricultural, construction, and maritime industries. This is the limit recently established for this substance in general industry.

Anhydrous sodium tetraborate is a light gray, odorless solid; the pentahydrate and decahydrate forms are white, odorless, and crystalline (ACGIH 1986, p. 60). Borates are used in agriculture as fertilizers and herbicides; in soap and other cleaners; as fire retardants; and for other purposes (Grayson 1985, p. 78). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide

Act (FIFRA).

The sodium salts of the tetraborates (anhydrous, pentahydrate, and decahydrate (Borax)) are irritating to the skin and respiratory tract in humans. The oral LDso in rats is 2660 mg/kg (RTECS 1990). Guinea pigs given three intratracheal injections of 50 mg each of borax dust (particle size below 5 µm) showed no reactions in the lung, the gastrointestinal tract, or any other organ (Clayton and Clayton 1981, p. 2986). Rats fed borax for 2 years at a dose equivalent to 1170 ppm borax (approximately 1 percent borax in the diet) showed growth suppression, gonadal degeneration, skin desquamation on paws and tails. testicular atrophy, and sterility, and dogs exposed to this dose also showed testicular atrophy. At a 350-ppm dose, no adverse effects on fertility, lactation, litter size, weight, or appearance were seen in rats. In 90-day feeding studies in dogs, a dose of 525 ppm in the diet was the no-effect level (Weir 1972).

Workers exposed to airborne concentrations of (borates) high enough

to interfere with normal visibility complained of dermatitis, cough, nasal irritation, nose bleeds, and shortness of breath (Birmingham 1963). At a concentration of 31 mg/m³, boric acid dust causes atrophy of the respiratory mucosa (Clayton and Clayton 1981, p. 3059)

In the prior air contaminants rulemaking, commenters discussed two NIOSH health hazard evaluations (HHEs) relevant to occupational exposure to the borates. The first study (HHE 75-059-498, NIOSH 19780) was conducted at the Kerr-McGee Chemical Corporation plant in Trona, California. NIOSH performed clinical examinations of nine employees exposed to tetraborates and collected total dust samples for each employee. Clinical examination revealed symptoms of eve irritation in five employees, nose irritation with bleeding in three workers, throat irritation in three employees, and chapping of the hands in four workers. Four of the nine dust samples exceeded 10 mg/m3, with the highest reading at 29.9 mg/m3. However, dust exposures at the California plant may have been well above the 10-mg/m3 level because employees at the plant commented that dust from "frequent [borate] windstorms" was the main problem at the plant. The NIOSH HHE did in fact report that dust levels at the plant were excessive and that the visibility of plant employees was impaired by this dust (Ex. 3-744, Attachment I)

The second NIOSH HHE (conducted in 1980) reported on a walk-through survey of the U.S. Borax and Chemical Corporation's Boron, CA operation. This HHE identified health complaints among employees, and its findings led to a larger, more comprehensive health survey in 1981 (HETA 80-109), a report of which was subsequently published in a peer-reviewed journal (Garabrant, Bernstein, Peters et al. 1985). Data on employees' respiratory symptoms were obtained by questionnaire, and total dust measurements were collected from historical data obtained between 1977 and 1981. The authors found no evidence of X-ray abnormalities or declines in pulmonary function among the 629 active employees examined. There was a dose-related and statistically significant increase in the frequency of reported symptoms, which included eye irritation, dry cough, nosebleeds, sore throat, shortness of breath, and chest tightness. Over 10 percent of employees having mean TWA tetraborate exposures of 8.6 mg/m3, measured as total tetraborate dust, reported experiencing nosebleeds, dry cough, eye irritation, and dryness of the

mouth, nose, or throat. At a mean exposure level of 14.6 mg/m³, between 15 and 30 percent of the employees examined reported these symptoms. The authors concluded that borax dust appears to act as a simple respiratory irritant and may cause small changes in pulmonary function among smokers who are also heavily exposed to borate dust.

Commenters (Ex. 3-744) in the earlier rulemaking took exception to the characterization of worker exposures in the Garabrant et al. paper (1985) on the grounds that exposures at the plant were much higher than reported in that paper and thus that the health effects observed were in fact associated with much higher borate concentrations than reported. Commenters (Ex. 3-744; Tr. 9-133) also stated that the available exposure data for the tetraborates were not adequate to define a dose-response relationship for these substances. As a consequence, U.S. Borax has been conducting a large epidemiologic study at its facility. The results of this study have become available since the conclusion of the prior rulemaking. This study examined the irritant response of 115 workers exposed to borate particulate. Detailed measurements of TWA and peak exposures to borates were made concurrent with medical assessments of the degree of irritation experienced by the exposed group of employees. The results indicate that, at TWA exposure levels between 1 and 4 mg/m3, there is less than a 5-percent probability that workers will experience moderate nose or eye irritation. At exposure levels between 5 and 9 mg/m3, there is an 18-percent probability that workers will experience moderate nasal irritation, but the probability of experiencing moderate eye irritation remains below 5 percent. At TWA exposure levels between 10 and 14 mg/ m3, the probabilities of experiencing moderate nasal or eye irritation increased dramatically to 30 percent and 10 percent, respectively.

Based on this evidence, OSHA has preliminarily concluded that it is appropriate in the present rulemaking to propose an 8-hour TWA PEL of 10 mg/m³ for all forms of sodium tetraborate in construction, maritime, and agriculture. This PEL will make OSHA's limit for these substances consistent across all regulated sectors, which is the primary goal of this rulemaking, At the first PEL update rulemaking, OSHA will consider the evidence for these substances again to determine whether further action is warranted.

BORON TRIFLUORIDE CAS: 7637-07-2; Chemical Formula: BF₃ H.S. No. 2020 OSHA's current PEL for boron trifluoride in general industry, construction, and maritime is 1 ppm as a ceiling limit; there is no current PEL in agriculture. The ACGIH TLV® for boron trifluoride is 1 ppm as a ceiling limit; the NIOSH recommendation for this substance is to reduce exposure to lowest feasible concentration. OSHA is proposing a ceiling of 1 ppm for boron trifluoride in agriculture. This is the limit recently established for this substance in general industry.

Boron trifluoride is used as a fumigant, a catalyst in organic synthesis, in soldering fluxes, and for neutron measurement (Proctor, Hughes and Fischman 1988, p. 100; ACGIH 1986, p. 63). It is a colorless gas that forms a dense white fume in moist air and has a persistent, pungent, and suffocating odor (Proctor, Hughes, and Fischman 1988, p. 100; Genium MSDS 1987, No. 91). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Act (FIFRA). Boron trifluoride is a severe irritant to the lungs, eyes, and skin in both animals and humans (Proctor, Hughes, and Fischman 1988, p. 100; ACGIH 1986, p. 63). The gas reacts with moisture to form boron trifluoride dihydrate, which has a 4-hour LCso of 436 ppm for rats; the symptoms exhibited included gasping, excessive oral and nasal discharge, and lacrimation (Proctor, Hughes, and Fischman 1988, p. 101). All animals exposed at 67 ppm, 6 hours/day, during a 14-day study died before the sixth exposure, and histopathology revealed necrosis and pyknosis of the proximal tubular epithelium of the kidneys; animals exposed to boron trifluoride concentrations of 24 ppm and 9 ppm experienced respiratory irritation, decreased body weight, and at autopsy showed increased lung weight as well as decreased liver weight (Proctor, Hughes, and Fischman 1988, p. 101). In humans, exposure for 30 to 60 minutes at a concentration of 50 ppm can cause massive fatal inflammation and

and serious burns to the eyes or skin.

Based on this evidence, OSHA
preliminarily concludes that agricultural
workers exposed to this substance are
at significant risk of experiencing
irritation of the eyes, skin, mucous
membranes, and respiratory tract. The
Agency believes that establishing a PEL
of 1 ppm as a ceiling limit for boron
trifluoride is necessary to protect
workers in agriculture from these
significant risks, which are material
impairments of health within the

congestion of the lungs. Boron trifluoride

gas or fume can cause redness, pain,

meaning of the Act. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. BROMINE

CAS: 7728-95-6; Chemical Formula: Br₂ H.S. No. 1042

OSHA's current exposure limit for bromine in general industry. construction, and maritime is 0.1 ppm as an 8-hour TWA. There is no PEL for bromine in agriculture. The ACGIH TLV*-TWA for bromine is 0.1 ppm (0.66 mg/m3), and the TLV*-STEL is 0.3 ppm (2.0 mg/m3). NIOSH has no REL for this substance but concurs with the PEL being proposed (Ex. 8-47). OSHA is retaining its 8-hour TWA PEL of 0.1 ppm in construction and maritime and is proposing to add a STEL of 0.3 ppm for bromine in these two sectors; in agriculture, OSHA is proposing both an 8-hour TWA of 0.1 ppm and a STEL of 0.3 ppm. This action will make the PEL for bromine consistent with the limits recently established for this substance in general industry.

Bromine is a dark, reddish-brown, noncombustible, diatomic liquid that has irritating vapors. It is used for shrink proofing wools; as an intermediate for fumigants, e.g. methyl bromide; in flame retardants; in gasoline additives (ethylene dibromide); in hydraulic fluids; for water disinfection; in desizing of cotton; in bleaching of pulp and paper; and in many other uses (Grayson 1985, pp. 185–186; Hawley's 1987, p. 169).

Bromine is a severe irritant of the eyes, skin, mucous membranes, and lungs in both animals and humans. The LC50 in mice is 750 ppm for 9 minutes (RTECS 1990); death occurred within 30 days in nearly 50 percent of mice exposed to a 240-ppm concentration of bromine for 2 hours (Bitron and Aharonson 1978). At autopsy, guinea pigs and rabbits exposed to a 300-ppm concentration of bromine for 3 hours showed pulmonary edema, a pseudomembranous deposit on the traches and bronchi, and hemorrhages of the gastric mucosa. Autopsy of animals that died several days after exposure revealed foci of bronchopneumonia and evidence of functional disturbances in the central nervous system (Lehmann and Hess 1987). Exposure of rats, mice, and rabbits to bromine concentrations of 0.2 ppm for 4 months resulted in respiratory, nervous, and endocrine system dysfunction; exposure of animals of the same species to a 0.02-ppm concentration for the same period produced no adverse effects (NRC 1981). Rats given 0.01 mg/kg bromine by oral administration daily for 6 months

exhibited changes in conditioned reflexes and in several blood indexes (NRC 1981).

Bromine causes lacrimation in humans at concentrations below 6.5 mg/ m3 (approximately 1 ppm) (NRC 1980), and inhalation of high concentrations may cause fatal chemical burns of the lungs, lesions of the mucous membranes of the upper airways, inflammation and swelling of the tongue and palate, spasm of the glottis, and asthmatic bronchitis (Parmeggiani 1983, p. 327). Workers handling bromine may develop pustules and furuncles of the skin in exposed areas; if the liquid is not removed immediately, deep, painful ulcers may develop (Oppenheim 1915). Workers exposed regularly to bromine concentrations of approximately 0.3 to 0.6 ppm for 1 year experienced headache, pain in the joints, chest, and stomach, irritability, and loss of appetite (Parmeggiani 1983, p. 327).

The Agency preliminarily concludes that exposure to bromine poses a significant risk of severe eye, skin, and respiratory irritation and believes that both the TWA and short-term limit are necessary to substantially reduce the risk of experiencing these effects. Accordingly, OSHA is proposing a limit for bromine of 0.1 ppm as an 8-hour TWA (in the agriculture sector) and 0.3 ppm as a 15-minute STEL (in the agriculture, construction, and maritime sectors). These limits are consistent with the general industry limits recently established for bromine and are necessary to substantially reduce a significant risk of material health impairment.

BROMOFORM

CAS: 75-25-2; Chemical Formula: CHBr₃ H.S. No. 2021

In general industry, construction, and maritime, OSHA's current permissible exposure limit for bromoform is 0.5 ppm as an 8-hour TWA, with a skin notation. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 0.5 ppm, with a skin notation, for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 0.5 ppm, and a skin notation, for bromoform. This action will make OSHA's limit for bromoform consistent across all industry sectors.

Bromoform is a colorless liquid with an odor like that of chloroform. Bromoform is used as a chemical intermediate, reagent, and solvent, as an ingredient in gauge fluid and fire-resistant chemicals, and in geological assaying. It is also used in the aircraft, aerospace, and shipbuilding industries (HSDB 1984; ACGIH 1986, p. 67).

Bromoform is an irritant of the eyes and respiratory tract and, at high concentrations, a narcotic; chronic exposures of laboratory animals to this substance have resulted in liver and kidney damage. The oral LDso for rats is 1147 mg/kg; the intraperitoneal LD50 for the same species is 414 mg/kg (RTECS 1990). Exposure of dogs to a 7000-ppm bromoform concentration caused anesthesia in 8 minutes and death in 60 minutes (Irish 1963). Instilled into the eyes of rabbits, bromoform caused moderate irritation, but healing was complete 2 days later. Moderate irritation resulted from repeated contact of this substance with rabbit skin (Torkelson and Rowe 1981). Exposure of rats to a 25-ppm concentration of bromoform for 4 hours/day for 2 months caused adverse effects on the liver and kidney (Torkelson and Rowe 1981).

Accidental ingestion of small amounts (unspecified doses) of bromoform caused central nervous system depression in humans (von Oettingen 1955), and inhalation of the vapor of this substance caused excessive salivation and irritation of the eyes (with lacrimation), respiratory tract, pharynx, and larynx (von Oettingen 1955). Workers exposed to a mixture of bromoform and bromoethane at approximately 100 mg/m3 experienced central nervous system and digestive disorders, chest pain, kidney dysfunction, and liver disease (Parmeggiani 1983, p. 328).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye and respiratory tract irritation and central nervous system depression associated with exposure to bromoform. The Agency believes that establishing an 8-hour TWA PEL of 0.5 ppm, and a skin notation, will substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

2-BUTANONE (METHYL ETHYL KETONE)

CAS: 78-93-3; Chemical Formula: CH-COCH2CH3 H.S. No. 1045

OSHA's current exposure limit for 2-butanone in general industry, construction, and maritime is 200 ppm as an 8-hour TWA. There is no PEL for 2-butanone in agriculture. The ACGIH TLV*-TWA for 2-butanone is 200 ppm, with a STEL of 300 ppm. The NIOSH REL for 2-butanone is 200 ppm (590 mg/m³) as a 10-hour TWA, and NIOSH concurs with the PELs being proposed

(Ex. 8-47). OSHA is proposing an 8-hour TWA PEL of 200 ppm and a 300-ppm STEL for 2-butanone in agriculture, construction, and maritime. This action will make the PEL for 2-butanone consistent with the limits recently established for this substance in general industry.

2-Butanone is a colorless, flammable liquid with an acetone-like odor (ACGIH 1986, p. 395). This substance is used as a solvent in resins, paint removers, cements, and coatings, and for many other purposes (ACGIH 1986, p. 395; Hawley's 1987, p. 769).

2-Butanone (also called methyl ethyl ketone) is irritating to the eyes, skin, and respiratory tract in both animals and humans; it is a central nervous system depressant and, in animals, a reproductive toxin. The oral LD50 in rats is 2737 mg/kg (RTECS 1990). The lowest lethal concentration in the same species is 2000 ppm for 4 hours, and the dermal LDso in rabbits is 13 g/kg (RTECS 1990). A drop of 2-butanone in the eye of a rabbit caused moderate and reversible injury, graded 5 on an ascending severity scale of 1 to 10 (Smyth 1969). Guinea pigs exposed to a 10,000-ppm concentration of the vapor for 5 hours exhibited signs of narcosis and of severe irritation of the nose and eyes (Clayton and Clayton 1982, p. 4729). Rats exposed to an 800-ppm concentration of 2butanone for 4 weeks showed increases in liver weights and in liver-to-body weight ratios at autopsy (Scand. J. Work Environ. Hlth 7(1):31, 1981). In a recent study (Takeuchi et al. 1983), rats exposed to a 200-ppm concentration of 2-butanone for 12 hours/day, 7 days/ week for 24 weeks showed slight and reversible neurological effects after 4 weeks of exposure. Exposure of pregnant rats to 1000 or 3000 ppm 2butanone for 7 hours/day on the sixth through fifteenth days of gestation resulted in skeletal abnormalities in the fetuses of rats in the 1000-ppm group and soft-tissue and skeletal abnormalities in the fetuses of rats in the 3000-ppm group (Schwetz, Leong, and Gehring 1974). A follow-up study confirmed 2-butanone's fetotoxicity but did not reveal teratogenic effects (Deacon, Pliny, John et al. 1981).

In humans, 2-butanone causes skin, eye, nose, and upper respiratory tract irritation; exposure to high concentrations may also cause narcosis. Brief exposure to concentrations of 33,000 or 100,000 ppm caused intolerable irritation in volunteers (Patty, Schrenk, and Yant 1935). Volunteers exposed briefly to a 100-ppm concentration reported slight nose and throat irritation; a 15-minute exposure to 200 ppm caused

irritation of the nose and throat; and concentrations greater than 300 ppm caused nausea and eye, nose, and throat irritation (Nelson, Enge, Ross, et al. 1943). Exposure to a 25-ppm concentration of 2-butanone for 5 minutes did not cause irritation (Nelson, Enge, Ross, et al. 1943). Workers exposed to 2-butanone via inhalation and skin contact have also reported experiencing dermatitis and numbness of the extremities (Smith and Mayers 1944). Two young women exposed concurrently to 2-butanone at concentrations of 298 to 560 ppm and to acetone at concentrations of 330 to 495 ppm exhibited signs of severe intoxication, including convulsions and loss of consciousness (Smith 1944).

In the recent air contaminants rulemaking in general industry, OSHA determined that an 8-hour TWA limit of 200 ppm and a 15-minute STEL of 300 ppm were necessary to protect workers in that sector from experiencing the significant irritation and narcotic effects associated with both full-shift and shortterm exposures to high concentrations of 2-butanone. Accordingly, OSHA has preliminarily concluded that a 200-ppm 8-hour TWA limit and a 300-ppm 15minute STEL are necessary to substantially reduce a significant risk of material health impairment among employees in the agricultural, construction, and maritime industries. This action will also make the PELs in these sectors consistent with those in general industry.

n-BUTYL ACETATE
CAS No. 123-86-4; Chemical Formula:
CH₃COO(CH₂)₃CH₃
H.S. No. 1047

The current OSHA exposure limit for n-butyl acetate in general industry, construction, and maritime is 150 ppm, measured as an 8-hour TWA. There is no PEL for n-butyl acetate in agriculture. The ACGIH TLV*-TWA for n-butyl acetate is 150 ppm, with a STEL of 200 ppm. NIOSH has no REL for this substance but concurs with the PELs being proposed (Ex. 8-47). OSHA is retaining the 8-hour TWA PEL of 150 ppm in construction and maritime, proposing a STEL of 200 ppm in these sectors, and proposing both limits in agriculture. These are the limits recently established for n-butyl acetate in general industry.

n-Butyl acetate is a colorless liquid with a fruity odor. It is used as a larvicide and in the manufacture of lacquers, artificial leather, photographic films, plastics, safety glass, and for many other purposes (Clayton and Clayton 1981, p. 2277; ACGIH 1986, p. 72). When used in pesticidal

applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

n-Butyl acetate is an irritant of the eyes, skin, and respiratory system; at high concentrations, it is also a narcotic. The oral LD50 in rats is 14 g/kg, and the LC60 in the same species is 2000 ppm for 4 hours (RTECS 1987). Cats exposed for 8 hours to a concentration of 6100 ppm showed slight narcotic effects (Flury and Wirth 1933, as cited in ACGIH 1986/Ex. 1-3, p. 72). When the concentration of nbutyl acetate was reduced to 1600 ppm, the cats exhibited signs of mild eve irritation and salivated excessively (Flury and Wirth 1933, as cited in ACGIH 1986/Ex. 1-3, p. 72). A paper by Sayers, Schrenk, and Patty (1936/Ex. 1-802) reported that guinea pigs showed signs of eye irritation at 3300 ppm, became unconscious after 9 hours of exposure to 7000 ppm, and died after 4 hours of exposure to a 14,000-ppm concentration. Cats exposed to a 4200ppm concentration 6 hours/day for 6 days lost weight, became weak, and showed blood changes; at a 12,000-ppm concentration, cats were anesthetized (Clayton and Clayton 1981, p. 2273). In contact with the skin of rabbits, n-butyl acetate caused moderate irritation (RTECS 1987); instilled into rabbit eyes, this substance produced injury graded 5 on an ascending severity scale of 1 to 10 (Smyth 1954).

Human volunteers complained of eye and throat irritation when exposed to a butyl acetate concentration of 200 ppm (RTECS 1990); these effects became quite severe at 300 ppm (Nelson, Enge, Ross, et al. 1943/Ex. 1-66). Several cases of vacuolar keratitis have been reported in workers exposed concurrently to a mixture of n-butyl acetate and isobutyl alcohol vapors; which compound was responsible for the damage is not known (Grant 1986, p. 163). A pharmaceutical manufacturing worker whose skin came into repeated contact with n-butyl acetate developed dermatifis (Roed-Peterson 1980, in HSDB 1985).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers are at significant risk of experiencing eye, skin, and respiratory irritation, in addition to narcotic effects, when exposed to n-butyl acetate in the workplace. Accordingly, OSHA is proposing the limits recently established in general industry, which are 150 ppm as an 8-hour TWA and 200 ppm as a 15minute STEL, for workplaces in the construction, maritime, and agriculture industries. OSHA preliminarily concludes that these limits are necessary to substantially reduce a significant risk of material impairment

of health among workers in these sectors.

n-BUTYL LACTATE
CAS: 138-22-7; Chemical Formula:
C₇H₁₄O₃
H.S. No. 1053

OSHA has no limit for n-butyl lactate in the construction, maritime, and agricultural industries; however, the Agency recently established a 5-ppm 8hour TWA for this substance in general industry. The ACGIH TLV*-TWA for nbutyl lactate is 5 ppm (30 mg/m3). NIOSH has no REL for this substance but concurs with the PEL being proposed (Ex. 8-47). OSHA is proposing a PEL of 5 ppm as an 8-hour TWA for n-butyl lactate in the agricultural, construction, and maritime industries. Promulgation of this limit will make the PEL for n-butyl lactate consistent across all OSHAregulated sectors.

Butyl lactate is a colorless ester of lactic acid (ACGIH 1986, p. 82). It is used as a solvent for nitrocellulose, ethyl cellulose, oils, dyes, natural gums, synthetic polymers, lacquers, and varnishes, as an antiskinning agent, and as an ingredient in perfumes, dry cleaning fluids, and adhesives. It is also a major component of many paints (Hawley's 1987, p. 188; ACGIH 1986, p. 82)

n-Butyl lactate causes irritation of the skin, eyes, and respiratory tract, as well as central nervous system depression, in both humans and animals. The subcutaneous LD₅₀ in rats is 12 g/kg; acutely poisoned mice exhibited somnolence and dyspnea before death (RTECS 1989). Applied to the skin of rabbits for 24 hours, butyl lactate caused moderate irritation (RTECS 1989).

Workers exposed for unspecified but prolonged periods to n-butyl lactate at a concentration of approximately 7 ppm, with brief peak excursions to 11 ppm, experienced headache, irritation of the pharyngeal and laryngeal mucosa, and coughing; some workers reported experiencing nausea, vomiting, and sleepiness at this concentration (Zuidema and Pel 1969, as cited in ACGIH 1986). Headache, coughing, and irritation of the pharynx were sometimes associated with exposure to n-butyl lactate concentrations of 4 ppm; however, no adverse effects were reported by workers when the concentration was reduced to 1.4 ppm (Zuidema and Pel 1969). Studies employing improved sampling and analytic methods have subsequently reported that, although the odor of nbutyl lactate is discernible at the 7-ppm level, this concentration does not produce objectionable or injurious

effects (Turner 1972/as cited in ACGIH

Based on this evidence, OSHA is proposing a 5-ppm 8-hour TWA limit to protect workers in construction, maritime, and agriculture from the significant risks of irritation, headache, and nausea caused by exposure to higher concentrations of n-butyl lactate. The Agency considers these effects material impairments of health within the meaning of the Act. This is the limit recently established for this substance in general industry, and OSHA preliminarily concludes that this limit is necessary to substantially reduce a significant risk of material health impairment among workers in these sectors.

n-BUTYL MERCAPTAN
CAS: 109-79-5; Chemical Formula:
CH₂CH₂CH₂CH₂SH
H.S. No. 1054

OSHA's current limit for n-butyl mercaptan in general industry, construction, and maritime is 0.5 ppm as an 8-hour TWA. There is no PEL for this substance in agriculture. The NIOSH REL for n-butyl mercaptan is 0.5 ppm as a 15-minute ceiling, and the ACGIH TLV®-TWA for this substance is 0.5 ppm (1.8 mg/m³). OSHA is retaining the 0.5 ppm PEL in the construction and maritime industries and is proposing this limit for agriculture; this is the limit recently established in general industry. This action will make the PEL for nbutyl mercaptan consistent across all OSHA-regulated sectors.

n-Butyl mercaptan is a colorless, flammable liquid that has a strong, obnoxious, garlic-like odor (ACGIH 1986, p. 83). It is used as a solvent, a chemical intermediate, and an odorant for natural gas (ACGIH 1986, p. 83;

Hawley's 1987, p. 178). n-Butyl mercaptan causes irritation and, at high concentrations, central nervous system depression. The LD50 in rats is 4020 ppm for 4 hours, and the oral LDso in rats is 1500 mg/kg (RTECS 1990). Acutely poisoned animals showed signs of mucous membrane irritation, dyspnea, incoordination, staggering gait, weakness, partial muscle paralysis, light to severe cyanosis, and mild to heavy narcosis (Fairchild 1958). Application of a drop of butyl mercaptan to rabbit eyes caused momentary minor irritation and closure of the lids (Grant 1974, p. 208). Guinea pigs showed no dermal injury when 0.2 ml of a 20-percent solution of butyl mercaptan was applied to clipped skin for 10 days (NIOSH 1978 Criteria Document). Animals that survived nearlethal doses of n-butyl mercaptan by intraperitoneal injection or oral administration frequently showed liver

and kidney damage when autopsied 20 days after exposure (Fairchild 1958, in Clayton and Clayton 1981, p. 2075).

Gobbato and Terribile (1968/Ex. 1–
178) have reported that symptoms of
CNS toxicity occurred in humans
exposed for 1 hour to concentrations of
n-butyl mercaptan believed to lie in the
range of 50 to 500 ppm. Three of these
workers became confused, and one went
into a 20-minute coma (NIOSH 1978
Criteria Document on Thiols). Gobbato
and Terribile also reported that mucosal
irritation occurred in human volunteers
exposed to a 4-ppm concentration of
ethyl mercaptan, a closely related
substance, and that irritation did not
occur at exposures to 0.4 ppm.

Based on this evidence, OSHA is proposing a PEL of 0.5 ppm as an 8-hour TWA for n-butyl mercaptan in the construction, maritime, and agriculture industries; this is the limit recently established in general industry. The Agency believes that this PEL is necessary to substantially reduce the significant risks of irritation and CNS toxicity, which constitute material health impairments and are associated with exposure to this substance. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. BUTYLAMINE

CAS: 109-73-9; Chemical Formula: CH₃(CH₂)₂CH₂NH₂ H.S. No. 2025

In general industry, maritime, and construction, OSHA's current permissible exposure limit for butylamine is 5 ppm as a ceiling limit, with a skin notation. There is no limit in agriculture. The ACGIH has a TLV® of 5 ppm as a ceiling limit, with a skin notation; NIOSH has no REL. OSHA is proposing a PEL for butylamine in agriculture of 5 ppm as a ceiling limit, with a skin notation. This is the limit recently established for this substance in general industry.

Butylamine is used mainly as an intermediate in the synthesis of insecticides, emulsifying agents, tanning agents, pharmaceuticals, dyestuffs, corrosion inhibitors, petroleum specialties, and rubber chemicals (ACGIH 1986, p. 79; AIHA 1978). It is a volatile, colorless liquid with an odor similar to that of ammonia (ACGIH 1986, p. 79).

Butylamine is irritating to the eyes, skin, mucous membranes, and respiratory tract in both humans and animals. The oral LD₅₀ for rats is 500 mg/kg, and the dermal LD₅₀ for guinea pigs is 0.5 ml/kg (RTECS 1990). In addition to irritation of the respiratory tract, inhalation of the vapors can also

cause pulmonary edema, central nervous system stimulation, depression, convulsions, and narcosis (Proctor, Hughes, and Fischman 1988, p. 108; AIHA 1978). Severe primary irritation and second-degree burns with vesiculation occur when the liquid contacts human skin. Irritation of the eyes, nose, and throat and, occasionally, headaches and facial skin flushing were experienced by workers exposed to butylamine at concentrations of 5 to 10 ppm on a daily basis. Exposure to concentrations above this (in the range of 10 to 25 ppm) were reported to be intolerable after a few minutes by some people, while exposures below 5 ppm resulted in no symptoms (Proctor, Hughes, and Fischman 1988, p. 108). The liquid tested on the eyes of experimental animals was severely damaging (extent of damage equivalent to the damage caused by ammonium hydroxide) (Grant 1986, p. 164; ACGIH 1986, p. 79). Exposure of rats to concentrations of butylamine ranging from 3000 to 5000 ppm for an unspecified time resulted in an immediate irritant response, with labored breathing and pulmonary edema; death occurred within minutes or hours after exposure (Proctor, Hughes, and Fischman 1988, p. 108).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing eye, skin, mucous membrane, and respiratory tract irritation, pulmonary edema, and central nervous system damage. OSHA considers these effects material impairments of health within the meaning of the Act. The Agency believes that establishing a ceiling limit of 5 ppm and a skin notation will substantially reduce these risks.

CAMPHOR (SYNTHETIC)
CAS: 76-22-2; Chemical Formula:
C10H16O
H.S. No. 1063

OSHA's current limit for synthetic camphor in general industry, construction, and maritime is 2 mg/m³ (0.3 ppm). There is no PEL in agriculture. The ACGIH TLV*s for camphor are a 2 ppm (12 mg/m³) TWA with a 3 ppm (18 mg/m³) STEL. NIOSH has no REL but concurs (Ex. 8–47) with the limit being proposed. OSHA is proposing an 8-hour TWA PEL of 2 mg/m³ for synthetic camphor in agriculture. This is the limit recently established for this substance in general industry.

Synthetic camphor is a colorless or white crystalline substance with an aromatic odor. This substance is used as a plasticizer in explosives and lacquers, an ingredient in insecticides, tooth powder, medicines, flavorings, and embalming fluids, and as a chemical intermediate (ACGIH 1986, p. 94).

In humans and animals, camphor is an irritant of the eyes, nose, and respiratory system. The LD50 in mice is 1310 mg/kg, and the lowest lethal concentration in the same species is 400 mg/m³ for 3 hours (RTECS 1991). Synthetic camphor is known to cause severe injuries in animals exposed for prolonged periods by inhalation to a level of 6 mg/m3. Exposure may cause convulsions, congestion, changes in the gastrointestinal tract, and damage to the kidneys and brain (Flury and Zernik 1931b/Ex. 1-996). Animal bioassays showed that camphor was not carcinogenic in rats injected subcutaneously; however, when the cancer promoter, croton oil, was concurrently applied to the skin of mice. 2 of 110 treated mice developed carcinomas (Graffi, Vlamynck, Hoffman, and Schultz 1953/Ex. 1-903).

In humans, there are reports of industrial exposure to camphor that resulted in coma, dyspnea, and headache; one fatality from inhalation of the vapor has been noted (Flury and Zernik 1931b/Ex. 1-996). A report by Gronka, Bobkoski, Tomchick, and Rakow (1969/Ex. 1-1043) evaluated airborne exposures and the health status of six employees in a syntheticcamphor-processing plant and reported that exposure for up to 10 months did not produce eye or nasal irritation if concentrations of camphor were maintained at or below 2 ppm. The health status of the six employees was determined before the plant installed local ventilation and improved handling procedures; at that time, camphor concentrations ranged from 24 to 43 mg/ m3. Four of the six employees examined showed inflammation of the nose and throat, and one reported having occasional numbness in the fingers. After process improvements were installed, only two of the employees were still working in the camphorprocessing area; the remaining four had been away from direct contact with camphor.

Based on this evidence, OSHA preliminarily concludes that the proposed 2 mg/m³ limit is necessary to protect workers in agriculture from the significant risk of headache, difficult breathing, and, if exposure is severe, coma and death. OSHA believes the proposed PEL will substantially reduce these risks. This is the limit recently established for this substance in general industry.

CAPROLACTAM (DUST)

CAS: 105-60-2; Chemical Formula: C₆H₁₁NO H.S. No. 1064

OSHA has no permissible exposure limit for caprolactam dust in the agricultural, construction, or maritime industries. In the recent air contaminants rulemaking, OSHA established a 1-mg/m38-hour TWA and a 3-mg/m3 STEL for this substance in general industry. The ACGIH TLV*-TWA for caprolactam dust is 1 mg/m3 as an 8-hour TWA. NIOSH has no REL for this substance but concurs with the limits being proposed (Ex. 8-47). OSHA is proposing a 1 mg/m38-hour TWA and a 3-mg/m3 STEL for caprolactam dust in the agricultural, construction, and maritime industries; this action will make the PEL for caprolactam dust consistent across all OSHA-regulated

Caprolactam is a white crystalline solid with an unpleasant odor (ACGIH 1986, p. 95(89)). It is used in the production of Nylon 6 fibers and resins, carpets, clothing, tires, wire insulation, brush bristles, floor polishes, concrete patching cement, and dyes (IARC 1986, p. 250).

In addition to sensory irritation, caprolactam causes central nervous system, respiratory, and cardiovascular effects in experimental animals and humans. The oral LD50 in rats is 1210 mg/kg; acutely poisoned animals convulsed and showed signs of eye irritation before death (RTECS 1990). In animals, exposure to caprolactam by any route causes convulsions, tremors, mydriasis, opisthotonus (Elison, Lien, Zinger, et al. 1971/Ex. 1-1050; Lien, Lien, and Tong 1971/Ex. 1-1089), and salivation (Goldblatt, Farquharson, Bennett, and Askew 1954/Ex. 1-1044). Convulsions occurred in rats, rabbits, and cats given intraperitoneal or intravenous injections of caprolactam at doses greater than 100 mg/kg (Goldblatt, Farquharson, Bennett, and Askew 1954/ Ex. 1-1044; Hohensee 1951). Cardiovascular and respiratory effects have been reported in rabbits and cats exposed to caprolactam; signs of poisoning included an initial increase. followed by a decrease, in blood pressure and an increase in respiratory rate (Goldblatt, Farquharson, Bennett, and Askew 1954/Ex. 1-1044). Weight loss and initial growth depression occurred in caprolactam-treated rats and mice (Morrison, Ross, and Ruth 1980/Ex. 1-1062). In a 90-day feeding study in dogs, Burdock, Kolwick, Alsakor, and Marshall (1984, as cited in ACGIH 1986/Ex. 1-3, p. 95) reported that animals given dietary doses of 0.1, 0.5, or 1.0 percent caprolactam showed

weight losses at both the 0.5-percent and 1.0-percent levels. A 2-year carcinogenicity bioassay of caprolactam in rats and mice was negative (NCI/NTP 1982). The results of studies of caprolactam's teratogenicity in rats and rabbits indicate that it is not teratogenic even at doses as high as 1000 mg/kg/ day (Gad, Powers, Robinson et al. 1984). Recent work on the genetic toxicity of caprolactam shows that this substance is not genotoxic in most short-term tests (Brady, Stack, and Waters 1989 (Toxline)). A three-generation study in rats involving dietary administration of caprolactam revealed no caprolactamrelated effects on the reproductive performance of rats of either sex or on pup survival (Serota, Hoberman, Friedman, and Grad 1988, in Toxline).

In humans, caprolactam has been shown to be a convulsant, a dermal and respiratory irritant, and a dermal sensitizer. Studies of industrial exposures to caprolactam dust in Germany report severe irritation when workers inhale caprolactam as dust; these workers experienced a bitter taste, nervousness, nose bleeds, upper respiratory tract irritation, and dry and splitting skin on the lips and nose (Hohensee 1951). Direct contact with the solid form of caprolactam produces primary skin irritation (Ferguson 1972; Brief 1972).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a limit for caprolactam dust in the agricultural, construction, and maritime industries, workers are at significant risk of experiencing respiratory irritation and adverse nervous system effects. Accordingly, OSHA is proposing a PEL of 1 mg/m3 (8-hour TWA) and a STEL of 3 mg/m3 for caprolactam dust in the agricultural, construction, and maritime industries. These are the limits recently established for caprolactam dust in general industry. OSHA preliminarily concludes that these limits are necessary to substantially reduce a significant risk of material impairment of health in exposed workers.

CAPROLACTAM (VAPOR)
CAS: 105-60-2; Chemical Formula:
C₀H₁₁NO

H.S. No. 1065

OSHA currently has no permissible exposure limit for caprolactam vapor in the agriculture, construction, or maritime industries. In the prior air contaminants rulemaking, OSHA established an 8-hour TWA of 5 ppm (20 mg/m³) for caprolactam vapor, supplemented by a STEL of 10 ppm (40 mg/m³), for workplaces in general industry. The

ACGIH TLV*-TWA for this substance is others reporting eye irritation at 5 ppm, with a STEL of 10 ppm. There is no NIOSH REL for caprolactam vapor. OSHA is proposing these limits for the agricultural, construction, and maritime industries; this action will make the PEL for caprolactam vapor consistent across all OSHA-regulated sectors.

Caprolactam is a white crystalline solid with a low vapor pressure at room temperature; thus, high vapor concentrations are likely to occur only at elevated temperatures (ACGIH 1986, p. 95(89)). Caprolactam is used to make nylon, carpets, resins, clothing, tires, wire brushes, floor polishers, and many

other products.

In addition to sensory irritation, caprolactam vapor can cause neurologic and respiratory effects in experimental animals and humans. The oral LD50 in rats is 1210 mg/kg, and the LCoo in the same species is 300 mg/m³ for 2 hours (RTECS 1990). Acutely poisoned animals convulsed and showed signs of eye irritation before death (RTECS 1990). A 1984 symposium on caprolactam reported that this substance causes convulsions, tremors, mydriasis, and salivation in experimental animals. Cardiovascular and respiratory effects were also seen in rabbits and cats; in addition, these animals showed an initial increase, followed by a decrease, in blood pressure and an increase in respiratory rate (ACGIH 1986, p. 95(89)). Injected at doses greater than 100 mg/ kg, caprolactam caused convulsions in rats, rabbits, and cats (Goldblatt 1954).

The health effects of exposure to caprolactam vapor in humans are identical to those described for caprolactam dust, except that contact with the vapor is reported to be even more irritating (Hohensee 1951, as cited in ACGIH 1986/Ex. 1-3, p. 95). Workers exposed to the vapor at a concentration of approximately 12 ppm complained of a bitter taste in the mouth, nervousness, nose bleeds, upper respiratory tract congestion, and dry and splitting skin; other workers reported experiencing heartburn, flatulence, and a heavy feeling in the stomach (Hohensee 1951, as cited in ACGIH 1986/Ex. 1-3, p. 95). In another report of industrial exposure to the vapor, Ferguson and Wheeler (1973/Ex. 1-1108) reported that workers routinely exposed for 18 years to unspecified levels and occasionally to concentrations as high as 100 ppm reported severe discomfort from burning nose, throat, and eyes. This irritant response was dose-related, with no workers reporting effects at concentrations of 7 ppm or below, some experiencing transient upper respiratory tract irritation at levels above that, and

concentrations of 25 ppm and above (Ferguson and Wheeler 1973/Ex. 1-1108). Ferguson (1972, as cited in ACGIH 1986/Ex. 1-3, p. 96.1) noted that a group of 143 workers, some of whom were exposed for as long as 17 years to vapor concentrations of 5 to 10 ppm, showed no evidence of adverse effects. At higher vapor exposures (13 to 130 ppm), all subjects experienced eye irritation (Ferguson 1972, as cited in ACGIH 1986/ Ex. 1-3, p. 96.1). Human volunteers exposed at low relative humidities to concentrations of the vapor in the range of 10 to 100 ppm showed a dose-related response, but at higher relative humidities, no irritation was observed below a concentration of 14 ppm (Ferguson and Wheeler 1973/Ex. 1-1108).

Based on this evidence in humans and animals, OSHA is proposing the limits recently established in general industry-5 ppm as an 8-hour TWA and 10 ppm as a 15-minute STEL-for workplaces in the construction, maritime, and agriculture industries. OSHA believes that these PELs are necessary to substantially reduce the significant risk of eye, upper respiratory tract, and skin irritation associated with exposure to this substance. OSHA considers these exposure-related effects to be material impairments of health. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

CESIUM HYDROXIDE CAS: 21351-79-1; Chemical Formula: CsOH

H.S. No. 1077

OSHA currently has no limit for cesium hydroxide in the agriculture. construction, or maritime industries. The ACGIH has a 2 mg/m3 8-hour TWA for cesium hydroxide. NIOSH has no REL for this substance but concurs with the proposed limit (Ex. 8-47). The Agency is proposing a 2 mg/m3 8-hour TWA PEL for cesium hydroxide in the construction, maritime, and agricultural industries; this is the limit recently established for this substance in general industry.

Cesium hydroxide is a colorless or yellowish fused crystalline mass; it is the strongest base known and is highly soluble in both water and alcohol (ACGIH 1986, p. 113). It is used as an electrolyte in alkaline storage batteries at subzero temperatures and as a catalyst in the polymerization of cyclic siloxanes (Hawley's 1987, p. 245; ACGIH 1986, p. 113)

In addition to causing sensory irritation, cesium hydroxide is corrosive

to the eyes of humans and experimental animals. The oral LD50 in rats is 570 mg/ kg (RTECS 1991). Acutely poisoned animals exhibited somnolence, muscle contractions or spasticity, and changes in respiration before death (RTECS 1991). Rabbits experienced severe eve irritation when 5 mg of a 5M solution of cesium hydroxide was instilled into their eyes and then rinsed out (RTECS 1991). In contact with the skin of rabbits, cesium hydroxide caused mild irritation (RTECS 1991). Studies indicate that cesium hydroxide has an acute oral toxicity of about one-third that of potassium hydroxide (Karpov 1971/Ex.

Inhalation of particles of cesium hydroxide or of mist containing cesium hydroxide is irritating to the eyes, nose, and upper respiratory tract in humans (Genium MSDS 1987, No. 201). If not removed promptly from the skin, this substance causes chemical burns (Genium MSDS 1987, No. 201)

Based on this evidence, OSHA is proposing an 8-hour TWA PEL of 2 mg/ m3 for cesium hydroxide in the construction, maritime, and agriculture industries; this is the limit recently established for this substance in general industry. The Agency preliminarily concludes that this PEL is necessary to protect workers from the significant risk of irritation and corrosive burns associated with exposure to this substance. OSHA considers these adverse health effects to be material impairments of health within the meaning of the Act and believes that the proposed PEL will reduce these risks substantially.

CHLORINE

CAS: 7782-50-5; Chemical Formula: Cl2 H.S. No. 1079

The current OSHA limit for chlorine in the construction and maritime industries is 1 ppm as a ceiling. There is no PEL for chlorine in agriculture. The 1987-1988 ACGIH TLV®-TWA for chlorine was 1 ppm (3 mg/m^3) , with a 3 ppm (9 mg/m^3) STEL. The NIOSH REL for chlorine is 0.5 ppm as a 15-minute ceiling; however, NIOSH concurs with the limits being proposed, which are the same PELs as those recently established for chlorine in general industry. OSHA is proposing a PEL of 0.5 ppm as an 8-hour TWA and a 15-minute STEL of 1 ppm for chlorine in the agricultural, construction, and maritime industries. This action will make OSHA's limit for chlorine consistent across all industry sectors.

Chlorine is a greenish-yellow, noncombustible gas at normal temperatures; it has a suffocating odor. At -35°C, chlorine condenses to an

amber liquid (ACGIH 1986, p. 117.1(87)). Chlorine has a wide range of uses; it is an oxidizing and chlorinating agent, an ingredient in many chlorinated organic compounds, and is used to purify water and to shrink-proof wool. Chlorine also is used in flame retardant compounds, in lithium and zinc batteries, and in the processing of meat, fish, vegetables, and fruit (ACGIH 1986, p. 117.1(87)).

Chlorine is a severe irritant of the eyes, nose, lungs, and skin in humans and animals. The LC₅₀ in rats is 293 ppm for 1 hour (RTECS 1991). Animals exposed to sublethal doses of chlorine for 15 to 193 days showed emphysema, bronchiolitis, and pneumonia at autopsy (Clayton and Clayton 1982, p. 2958).

The acute effects of chlorine exposure in humans have been well documented since World War I, when chlorine gas was used as a chemical warfare agent. Other severe exposures have resulted from the accidental rupture of chlorine tanks. These exposures have caused death, lung congestion, and pulmonary edema, pneumonia, pleurisy, and bronchitis. The lowest lethal concentration reported is 430 ppm for 30 minutes (Clayton and Clayton 1982, p. 2957]; exposure to 15 ppm causes throat irritation, exposures to 50 ppm are dangerous, and exposures to 1000 ppm can be fatal, even if exposure is brief (Sax and Lewis 1989, p. 768). A study of 332 workers exposed to chlorine for an average of 10.9 years was published in 1970. All but six workers had exposures below 1 ppm; 21 had TWAs above 0.52 ppm. No evidence of permanent lung damage was found, but 9.4 percent of these workers had abnormal EKGs compared to 8.2 percent in the control group. The incidence of fatigue was greater among those exposed to chlorine above 0.5 ppm (ACGIH 1986, p. 117.1[873]). In 1981, a study was published involving 29 subjects exposed to up to 2.0 hours for 4- and 8-hour periods. Exposures of 1.0 ppm for 8 hours produced statistically significant changes in pulmonary function that were not observed at the 0.5 ppm exposure concentration. Six of 14 subjects exposed to 1.0 ppm for 8 hours showed increased mucus secretions from the nose and in the hypopharynx. Responses ranging from sensations of itching or burning of the nose and eyes to general discomfort were not severe but were perceptible, especially at 1.0 ppm exposure level. A 1983 study of pulmonary function in workers exposed to low concentrations of chlorine also found transient decreases in pulmonary function at the 1.0 ppm exposure level, but not at the 0.5 ppm level (ACGIH 1988, p. 117.1[87]-117.2[87]).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers in construction, maritime, and agriculture are at significant risk of experiencing the severe irritation associated even with brief exposure to this substance. OSHA considers these effects material impairments of health and believes that the proposed PELs of 0.5 (8-hour TWA) and 1 ppm (STEL) are necessary to substantially reduce this significant risk. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors. CHLORINE TRIFLUORIDE CAS: 7790-91-2

H.S. No. 2030; Chemical Formula: CIF₃
OSHA has no limit for chlorine
trifluoride in agriculture; however, the
Agency's current PEL for this substance
in general industry, construction, and
maritime is 0.1 ppm as a ceiling limit.
The 1987–1988 ACGIH TLV* for chlorine
trifluoride is 0.1 ppm as a ceiling limit;
there is no NIOSH REL for this
substance. OSHA is proposing a PEL of
0.1 ppm as a ceiling for chlorine
trifluoride in agriculture. This is the limit

recently established for this substance in general industry.

Chlorine trifluoride is a gas that is nearly colorless and has a sweet but irritating odor. This substance is easily pressurized to a pale green liquid; when frozen, it forms a white solid (ACGIH 1986, p. 119; Braker and Mossman 1980, p. 164). Chlorine trifluoride is used as an incendiary, as a fluorimetry agent, as a pyrolysis inhibitor for fluorocarbon polymers, as an ignitor and propellant for rockets, in cutting oil well tubes, and in the reprocessing of nuclear reactor fuels (Hawley's 1987, p. 280; Proctor, Hughes, and Fischman 1988, p. 131).

In animals, gaseous chlorine trifluoride causes lung damage and severe irritation of the eyes, skin, and respiratory tract; only limited data are available on human exposure to this substance (Proctor, Hughes, and Fischman 1988, p. 131; RTECS 1990). The LC60s in monkeys, mice, and rats are, respectively: 230 ppm for 1 hour, 178 ppm for 1 hour, and 400 ppm for 30 minutes. In humans, the estimated LC60 is 50 ppm; no duration is specified (RTECS 1990). In one inhalation study, all rats exposed to 800 ppm for 15 minutes died, but most rats survived exposure to this concentration when the duration was reduced to 13 minutes. Acutely poisoned animals showed severe inflammation of the mucous membranes, lacrimation, ulceration of the cornea, and burns of the skin in exposed areas (Proctor, Hughes, and Fischman 1988, p. 131; ACGIH 1986, p.

119). Two dogs and 20 rats exposed to chlorine trifluoride at a concentration of approximately 1.17 ppm for 6 hours a day, 5 days/week for 6 months experienced severe pulmonary irritation, and some of the animals died (ACGIH 1986, p. 119). Although information on human exposure to chlorine trifluoride is lacking, it is believed that exposure would result in severe irritation or burns of the eyes and skin and that inhalation would cause pulmonary edema (Proctor, Hughes, and Fischman 1988, p. 131).

Based on this evidence, OSHA preliminarily concludes that, in the absence of an exposure limit, agricultural workers are at significant risk of experiencing irritation and burns of the eyes and skin, as well as pulmonary edema, if they are exposed to chlorine trifluoride even for a very brief time. The Agency believes that the proposed PEL of 0.1 ppm as a ceiling limit is necessary to reduce these significant risks among agricultural workers. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CHLOROACETALDEHYDE
CAS: 107-20-0; Chemical Formula:
CICH2CHO

H.S. No. 2031

OSHA has no limit for chloroacetaldehyde in agriculture; however, the Agency's current PEL for this substance in general industry, construction, and maritime is 1 ppm as a ceiling limit. The 1987–1988 ACGIH TLV* for chloroacetaldehyde is 1 ppm as a ceiling limit; NIOSH has no REL for this substance. OSHA is proposing to establish a ceiling limit of 1 ppm for chloroacetaldehyde in agriculture. This is the limit recently established for this substance in general industry.

Chloroacetaldehyde is used as a fungicide, to help facilitate the removal of bark from trees, and as a chemical intermediate in the manufacture of 2-aminothiazole and other compounds (Hawley's 1987, p. 280; Proctor, Hughes, and Fischman 1988, p. 132). Chloroacetaldehyde is a clear, colorless liquid with a very sharp, irritating odor (Hawley's 1987, p. 260). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Chloroacetaldehyde is corrosive and severely irritating to the eyes, skin, and mucous membranes of both humans and animals (Hawley's 1987, p. 260; ACGIH 1986, p. 120). The oral LD₅₀ in rats is 75 mg/kg and the dermal LD₅₀ in rabbits is

224 mg/kg (RTECS 1990). A solution of 30 percent chloroacetaldehyde in water produced severe damage when applied to the skin and eyes of rabbits (Proctor, Hughes, and Fischman 1988, p. 132). An inhalation study in rats showed that exposure to a 5-ppm concentration of chloroacetaldehyde (for an unspecified time) caused eye and nasal irritation (ACGIH 1986, p. 120).

In humans, repeated or prolonged exposures to concentrations that cause even slight irritation may result in injury (ACGIH 1986, p. 120). If a strong solution of chloroacetaldehyde contacts the eye, it is likely to cause permanent tissue damage and visual impairment (Proctor, Hughes, and Fischman 1988, p. 132; ACGIH 1986, p. 120). Severe burns may result from a single brief contact of the skin with a 40-percent aqueous solution of chloroacetaldehyde (ACGIH 1986, p. 120).

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to chloroacetaldehyde at the levels permitted by the absence of a limit are at significant risk of experiencing irritation of the eyes, skin, and mucous membranes. The Agency believes that establishing a PEL of 1 ppm as a ceiling limit is necessary to protect workers in agriculture from these significant risks, which represent material impairments of health within the meaning of the Act. This is the limit recently established for this substance in general industry.

alpha-CHLOROACETOPHENONE CAS: 523–27–4; Chemical Formula: C₆H₆COCH₂Cl

H.S. No. 2032

OSHA's PEL for alphachloroacetophenone in general industry, construction, and maritime is 0.05 ppm as an 8-hour time-weighted average (TWA); there is no PEL in agriculture. The 1987–1988 ACGIH TLV*-TWA for alpha-chloroacetophenone is 0.05 ppm as an 8-hour TWA; there is no NIOSH REL for this substance. OSHA is proposing an 8-hour TWA PEL of 0.05 ppm for alpha-chloroacetophenone in agriculture. This is the limit recently established for this substance in general industry.

alpha-Chloroacetophenone is a crystalline substance that is colorless to grey in appearance; at very low concentrations, it has a floral (apple blossom-like) odor (ACGIH 1986, p. 121; Gosselin, Smith, and Hodge 1984, p. II–96). It is a chemical warfare agent and is the main ingredient in the chemical mace (used for riot control and personal protection). This substance is also used as an intermediate in the pharmaceutical industry and formerly

found use as an alcohol denaturant (Proctor, Hughes, and Fischman 1988, p. 132; HSDB 195; Hawley's 1987, p. 261).

alpha-Chloroacetophenone is a severe

irritant and lacrimator in both animals and humans; exposure to high concentrations also can cause pulmonary edema (ACGIH 1986, p. 121). The oral LD50 in rats is 50 mg/kg; the lowest lethal concentration reported in the same species is 417 mg/m3 (approximately 70 ppm) for 15 minutes (RTECS 1990). Rabbits exposed dermally to a 12-percent solution of alpha-chloroacetophenone exhibited moderate skin irritation (RTECS 1990). When applied either topically or intradermally, alphachloroacetophenone caused contact sensitization in guinea pigs (HSDB 1985). Instilled into rabbit eyes, this substance produced mild to severe irritation, depending on the amount dropped into the eye (RTECS 1990). The eyes of laboratory animals exposed to high (not further specified) concentrations of alpha-chloroacetophenone vapor showed permanent opacification, ulceration with vascularization, and perforations (Gosselin, Smith, and Hodge 1984, p. II-97).

Humans acutely exposed to alphachloroacetophenone (200 to 340 mg/m3, or approximately 32 to 54 ppm) for 30 seconds experienced a burning sensation in the eyes, tearing, blurred vision, nasal irritation, runny nose, and a burning sensation in the throat (Proctor, Hughes, and Fischman 1988, p. 132). Contact with the eye can result in permanent partial opacity, reversible corneal haziness, and ocular pain (ACGIH 1986, p. 121; Gosselin, Smith, and Hodge 1984, p. II-96). Contact of this substance with the skin may result in burning and irritation (especially if the skin is moist), allergic contact dermatitis, and skin sensitization (ACGIH 1986, p. 121; Proctor, Hughes, and Fischman 1988, p. 132). Pulmonary edema caused the death of one individual exposed by inhalation to a high concentration (not further specified) of alpha-chloroacetophenone (Proctor, Hughes and Fischman 1988, p. 132). The use of alphachloroacetophenone as a riot-control agent has caused several deaths; the estimated lethal concentration in humans is 850 mg/m³ (approximately 134 ppm) for 10 minutes (ACGIH 1986, p. 121; Gosselin, Smith, and Hodge 1984, p.

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to alphachloroacetophenone at the levels permitted by the absence of an exposure limit are at significant risk of

experiencing eye, skin, and respiratory tract irritation, dermatitis, and contact sensitization. Workers exposed to high concentrations may also be at risk of experiencing pulmonary edema. The Agency believes that establishing a PEL of 0.05 ppm as an 8-hour TWA will protect workers in agriculture from these significant occupational risks which constitute material health impairments within the meaning of the Act. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CHLOROACETYL CHLORIDE
CAS: 79-04-9; Chemical Formula:
CICH₂COCl
H.S. No. 1083

There is no PEL for chloroacetyl chloride in the agriculture, construction, or maritime industries. The 1987–1988 ACGIH TLV*–TWA for this substance was 0.05 ppm (0.23 mg/m³). There is no NIOSH REL for chloroacetyl chloride; however, NIOSH concurs with the limit being proposed. OSHA is proposing an 8-hour TWA PEL of 0.5 ppm for chloroacetyl chloride in the agricultural, construction, and maritime industries; this is the limit recently established by OSHA for this substance in general industry.

Chloroacetyl chloride is a colorless liquid with a pungent odor (ACGIH 1986, p. 123(89)). It is used in the production of chloroacetophenone and tear gas (ACGIH 1986, p. 123(89); Hawley's 1987, p. 261).

In addition to sensory irritation, chloroacetyl chloride may cause burns of the eyes and skin. The LD50 in rats is 120 mg/kg, and the LCso in the same species is 1000 ppm for 4 hours (RTECS 1989). The dermal LD50 in rabbits ranges from 316 to 501 mg/kg (Torkelson 1956). The minimum concentration of chloroacetyl chloride lethal to mice exposed for 2 hours is 2500 ppm. Before death, acutely poisoned animals became agitated and showed signs of severe eye and respiratory tract irritation (Herzog 1959). Inhalation of 4 ppm for 5 to 10 minutes caused respiratory problems in rats; however, no effect was observed in these animals when they inhaled 2.5 ppm for a period of 7 hours (Dow Chemical Company 1977a, as cited in ACGIH 1986/Ex. 1-3, p. 122). Thirty-day inhalation studies with rats, mice, and hamsters showed that these animals developed eye and respiratory irritation at 2.5 ppm but showed no effects at a 0.5-ppm concentration (Dow Chemical Company 1977a, as cited in ACGIH 1986/Ex. 1-3, p. 122).

The acute effects associated with exposure to chloroacetyl chloride in

humans include mild to moderate skin burns and erythema, eye burns and tearing, cough, and dyspnea. Eye and respiratory irritation occurred in an industrial setting characterized by a chloroacetyl chloride concentration of 0.009 to 0.017 ppm, with excursions as high as 0.14 ppm (Dow Chemical Company 1977a, as cited in ACGIH 1986/Ex. 1-3, p. 122). A worker accidentally drenched with a mixture containing chloroacetyl chloride developed extensive first- and seconddegree burns and pulmonary edema and experienced three episodes of cardiac arrest, followed by coma and anoxiainduced brain damage (Pagnotto 197, as cited in ACGIH 1986/Ex. 1-3, p. 122). Other ingredients of the mixture involved in the accident included xylidine, benzene, and sodium carbonate. Rescuers of this victim experienced hand blisters, chest tightness, and nausea for two days.

Based on this evidence, OSHA preliminarily concludes that an 8-hour TWA limit of 0.05 ppm for chloroacetyl chloride is necessary to protect employees in the agriculture, construction, and maritime industries from the significant risk of eye, skin, and respiratory irritation and burns of exposed tissue associated with exposure to this substance. OSHA determined in the recent general industry rulemaking that this limit will substantially reduce this risk of material health impairment and believes that the same PEL is necessary to protect workers in agriculture, construction, and maritime. Accordingly, OSHA is proposing a PEL of 0.05 ppm as an 8-hour TWA for chloroacetyl chloride in these sectors. Promulgation of this PEL will make OSHA's limit for this substance consistent across all regulated sectors.

o-CHLOROBENZYLIDENE
MALONONITRILE
CAS: 2698-41-1; Chemical Formula:
CIC₆H₄CH=C(CN)₂
H.S. No. 1084

OSHA's PEL for o-chlorobenzylidene malononitrile (OCBM) in the construction and maritime industries is 0.05 ppm as an 8-hour TWA. There is no PEL for this substance in agriculture. The ACGIH TLV®-TWA for ochlorobenzylidene malononitrile is 0.05 ppm as a ceiling, with a skin notation. There is no NIOSH REL for this substance. OSHA is proposing a ceiling limit of 0.05 ppm, with a skin notation. for OCBM in the agricultural, construction, and maritime industries. NIOSH concurred with this limit when the Agency recently established it in general industry.

o-Chlorobenzylidene malononitrile is a white, crystalline solid with a pepperlike odor (ACGIH 1986, p. 124). It is used as an incapacitating agent by military and law enforcement personnel (ACGIH 1986, p. 124; Hawley's 1987, p. 263).

In addition to sensory irritation, this substance causes dermatitis and skin sensitization in humans. The oral LD50 in rats is 187 mg/kg, and the lowest lethal concentration in the same species is 1806 mg/m3 (225 ppm) for 45 minutes (RTECS 1991). In animals, OCBM is metabolized by the body into cyanide (Frankenberg and Sorbo 1973/Ex. 1-480). Death caused by inhalation exposure is a result of lung damage, with broncho pneumonia and asphyxiation. Twenty rats exposed to a 2700-mg/m³ (337 ppm) concentration of OCBM for 1 hour died (Proctor, Hughes, and Fischman 1988, p. 134). Short-term exposures to high levels of OCBM did not cause carcinogenic, teratogenic, or embryolethal effects in animals (McNamara et al. 1973). Applied to rabbit eyes, OCBM causes severe irritation (RTECS 1991).

In humans, OCBM has extremely irritating properties. It causes intense eye and skin irritation, coughing, difficulty in breathing, chest tightness, rhinorrhea, dizziness, nausea, and vomiting. These effects are evident on exposure to OCBM concentrations between 12 and 20 mg/m3 (1.5 to 2.5 ppm), and they become incapacitating within 20 seconds of the onset of such exposures; the effects persist for approximately 5 to 10 minutes after the exposed individual has been moved to fresh air (Military Chemistry and Chemical Agents 1963, as cited in ACGIH 1986/Ex. 1-3, p. 124). Three of four human volunteers exposed to a 1.5mg/m3 (0.19-ppm) concentration of OCBM aerosol for 90 minutes developed headaches, and one showed mild eye and nose irritation. Headache persisted for 24 hours in two subjects. At a concentration of 4 to 5 mg/m3 (0.5 to 0.8 ppm), subjects' problem-solving abilities were affected and they developed conjunctivitis, eye tearing, and skin burns (Punte, Owens, and Gutentag 1963/Ex. 1-353). Other researchers observed no persistent clinical abnormalities in seven subjects exposed to OCBM at concentrations ranging from 1 to 13 mg/m3 (0.13 to 1.8 ppm) over a 15day period. Twenty-five of 28 workers in an OCBM production plant reported having had repeated episodes of dermatitis of the arms and neck, and two of these workers had positive patch tests when challenged with OCBM (Shmunes and Taylor 1973/Ex. 1-370).

Based on this evidence, OSHA is proposing a PEL of 0.05 ppm as a ceiling,

with a skin notation, for ochlorobenzylidene malononitrile; this is the limit recently established for this substance in general industry. The Agency preliminarily concludes that this limit is necessary to substantially reduce a significant risk of severe eye and upper respiratory tract irritation, skin sensitization, and dermatitis among workers in construction, maritime, and agriculture. OSHA considers these exposure-related health effects material impairments of health within the meaning of the Act. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CHLOROPICRIN

CAS: 76–06–2; Chemical Formula: CCl₃NO₂ H.S. No. 2037

OSHA has no limit for chloropicrin in agriculture; however, the Agency's current PEL for this substance in construction, general industry, and maritime is 0.1 ppm as an 8-hour time-weighted average (TWA). The 1987–1988 ACGIH TLV*-TWA is also 0.1 ppm; there is no NIOSH REL for this substance. The Agency is proposing an 8-hour TWA of 0.1 ppm for chloropicrin in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all industry sectors.

Chloropicrin is an oily, colorless to faint-yellow liquid with an intense odor (HSDB 1985). Chloropicrin is used as an insecticide, fungicide, herbicide in soil, and as a stored grain fumigant to control insects and rodents. It is also used as a tear gas, in the synthesis of methyl violet, and as an additive to increase the odor warning properties of other chemicals (HSDB 1985; ACGIH 1986, p. 134; Hawley's 1987, p. 271). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Chloropicrin is a severe irritant of the eyes, mucous membranes, skin, and upper respiratory tract (HSDB 1985; ACGIH 1986, p. 134; Proctor, Hughes, and Fischman 1988, p. 149). The oral LDso in rats is 250 mg/kg; the LCso in mice is 1600 mg/kg (approximately 230 ppm) for 10 minutes (RTECS 1990; ACGIH 1986, p. 134). Acutely poisoned animals showed congestion, hemorrhage, lung edema, and inflammation before death (ACGIH 1986, p. 134). Necrosis of the liver, kidneys, and skeletal muscles was seen in these animals after chronic exposure (ACGIH 1986, p. 134). Exposure to a 9ppm concentration of chloropicrin

caused a 50-percent decrease in respiratory rate; at autopsy, ulceration and necrosis of the respiratory tract lining, pulmonary edema, and moderate lung damage were seen (Proctor, Hughes, and Fischman 1988, p. 149). A carcinogenicity bioassay of chloropicrin found no significant incidence of tumors in rats or mice (HSDB 1985).

In humans, the lethal dose is estimated to be 119 ppm for 30 minutes: death in these cases is caused by pulmonary edema (Proctor, Hughes, and Fischman 1988, p. 149). Exposure to chloropicrin vapor concentrations ranging from 0.30 to 0.37 ppm causes painful irritation and tearing of the eyes in 3 to 30 seconds, and inhalation of a 7.5-ppm concentration for 10 minutes or of 15 ppm for 1 minute is described by exposed individuals as intolerable (Clayton and Clayton 1981, p. 4165; ACGIH 1988, p. 134). Accidental ingestion of the liquid causes gastroenteritis, severe nausea, vomiting, colic, and diarrhea (HSDB 1985).

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to chloropicrin at the levels permitted by the absence of a limit are at significant risk of experiencing irritation of the eyes, skin, mucous membranes, and lungs. The Agency believes that establishing a PEL for chloropicrin of 0.1 ppm as an 8-hour TWA is necessary to substantially reduce these risks in agricultural workplaces. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

COPPER (DUSTS AND MISTS) CAS: 7440-50-8; Chemical Formula: Cu H.S. No. 2041

In general industry, construction, and maritime, OSHA's permissible exposure limit for copper dusts and mists is 1 mg/m³ as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV°-TWA for copper dusts and mists of 1 mg/m³ as an 8-hour limit. NIOSH has no REL but concurs (Ex. 8-47, Table N1) with the limit being proposed. OSHA is proposing to establish an 8-hour TWA limit of 1 mg/m³ for copper dusts and mists in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all OSHA-regulated sectors.

Copper is an odorless, reddish brown, ductile metal or powder. Copper is widely used as a structural metal in electric wiring, switches, heating, plumbing, roofing, building construction, alloys, coins, insecticides, chemical and pharmaceutical machinery, electroplated protective coatings and undercoats, antifouling paints, and as a

catalyst (Genium MSDS 1990, No. 162; ACGIH 1986, p. 148).

Exposure to copper dust or mist causes eye, skin, and respiratory tract irritation, as well as liver, kidney, and hematological effects. The lowest toxic oral dose for copper dust in rats is 1210 mg/kg (RTECS 1990). In mice, the intra peritoneal LD50 for the dust is 3.5 mg/kg (Clayton and Clayton 1981, p. 1623). Signs of acute copper poisoning in animals include nausea, vomiting, salivation, purgation, tachycardia, convulsions, paralysis, and collapse, followed by death. Autopsy of acutely poisoned animals shows gastroenteritis and congestion of the spleen, liver, and kidneys (Clarke 1981, p. 45, in HSDB 1985). Chronic ingestion of copper by animals leads to a pigmentary cirrhosis of the liver (Mallory and Parker 1931; Wiederanders et al. 1968, in Gosselin 1984, p. III-122). The offspring of rats given copper orally several weeks before mating showed embryotoxic and developmental effects (RTECS 1990).

In humans, exposure to copper dusts and mists is associated with irritation of the eyes and respiratory tract. If the exposure is prolonged or severe, nasal ulceration and perforation of the septum may occur. The lowest toxic oral dose of copper in humans is reported to be 120 μg/kg; at this dose, gastrointestinal effects were seen (RTECS 1990). Acute copper poisoning causes jaundice and tenderness in the area of the liver (Webster 1930; Chuttani et al. 1965, in Gosselin 1984, p. III-121). Greenish discoloration of the skin and hair have been reported in workers exposed to copper dust and mist (Saltzer and Wilson 1968; Stokinger 1963, in Proctor and Hughes 1978, p. 181). Allergic contact dermatitis is rare among copper workers, but this condition has been reported occasionally (Adams, R. M., ed. Occupational Skin Disease 1983). The main effects from industrial exposure to copper dust and mist involve the respiratory tract; symptoms of acute overexposure include chills, fever, aching muscles, dry mouth and throat, and headache (Clayton and Clayton 1981, p. 1628). Three men who were exposed to fine copper dust at concentrations of 0.075 to 0.120 mg/m3 suffered from apparent metal fume fever (Proctor and Hughes 1978, p. 181). Seven cases of copper fever were reported in workers in a paint factory where copper oxide was being pulverized (Shiötz 1949, in Clayton and Clayton 1981, p. 1628). Copper dust exposure may also cause systemic effects similar to those caused by other heavy metal exposure such as capillary damage, kidney and liver injury, and central nervous system excitation followed by depression

(Gosselin 1984, p. III-121). Chronic exposure to copper may cause anemia, widespread damage to the small blood vessels, and injury to the liver and kidney (Gosselin, Smith, and Hodge 1984, p. III-121; ACGIH 1986, p. 148).

Based on this evidence in humans and animals, OSHA preliminarily concludes that exposure to copper dusts and mists causes eve, skin, and respiratory tract irritation, kidney and liver damage, and circulatory system effects in humans and animals. OSHA therefore believes that, in the absence of a limit, workers in agriculture are at significant risk of experiencing these adverse health effects. The Agency believes that the proposed limit for copper dusts and mists of 1 mg/m3 as an 8-hour TWA in agriculture is necessary to significantly reduce these risks of material health impairment. Promulgation of this limit also will make the PEL for copper dust and mist consistent across all OSHAregulated sectors.

COPPER (FUME) CAS: 7440–50–8; Chemical Formula: Cu H.S. No. 1101

OSHA's limit for copper fume in general industry, construction, and maritime is 0.1 mg/m³ as an 8-hour TWA. The ACGIH TLV® is 0.2 mg/m³ as an 8-hour TWA. NIOSH has no REL but concurs (Ex. 8-47, Table N1) that the proposed 0.1-mg/m³ limit in agriculture is appropriate. Promulgation of this PEL will make OSHA's limit for copper fume consistent across all regulated sectors.

There are few toxicological data available on copper fume's effects in experimental animals. The oral LD₅₀ for cupric oxide (finely divided copper dust) is 470 mg/kg (Clayton and Clayton 1981, p. 1624).

In humans, exposure to copper fume causes metal fume fever. The signs and symptoms of this syndrome include fever lasting for as long as 48 hours, chills, aching muscles, and headaches. Welders exposed chronically to copper fumes experienced sneezing, cough, fever, atrophy and ulceration of the nasal mucosa, and a metallic taste (Clayton and Clayton 1981, p. 1628). Workers exposed to copper fume at a concentration of 1 to 3 mg/m3 experienced an altered taste response (ACGIH 1986, p. 146). When exposures were reduced to between 0.02 and 0.04 mg/m3, this effect disappeared (ACGIH 1986, p. 146).

Based on this evidence, OSHA preliminarily concludes that exposure to copper fume is associated with metal fume fever; OSHA considers this condition a material impairment of health. The Agency believes that the

proposed PEL of 0.1 mg/m³ will substantially reduce the risk that workers in agriculture will experience metal fume fever. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. CYANOGEN CAS: 460–19–5; Chemical Formula: (CN

CAS: 460–19–5; Chemical Formula: (CN)₂ H.S. No. 1105

OSHA currently has a TWA PEL of 10 ppm for cyanogen in general industry and in the construction and maritime industries. The Agency has no PEL for cyanogen in agriculture. The ACGIH has a TLV*-TWA of 10 ppm for this substance; there is no NIOSH REL, although NIOSH concurs with the limit being proposed in agriculture, which is 10 ppm as an 8-hour TWA. This action will make the PEL for cyanogen consistent across all OSHA-regulated sectors.

Cyanogen is a colorless gas with an almond-like odor. It is used as a fumigant and chemical intermediate, an ingredient in rocket and missile propellants, and in the welding and cutting of heat-resistant metals (Braker and Mossman 1980, p. 1986). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Cyanogen is an irritant of the eyes. mucous membranes, and respiratory tract in both animals and humans: severe exposure may cause pulmonary edema (ACGIH 1986, p. 154). Cyanogen's effects resemble those of other cyanides (Clayton and Clayton 1981, p. 4858). The LC50 in rats is 350 ppm for 1 hour; acutely poisoned animals showed eve and pulmonary system effects and behavioral changes (RTECS 1991). The acute toxicity of cyanogen in various animal species is high (Flury and Zernik 1931d). Exposure to a 100-ppm concentration was fatal to cats in 2 to 3 hours, and exposure to 400 ppm was fatal to rabbits in less than 2 hours. Cats exposed to a 50-ppm concentration were severely affected but subsequently recovered (Flury and Zernik 1931d). Experiments in rats suggest that cyanogen is approximately 10 times less acutely toxic than hydrogen cyanide (McNerney and Schrenk 1960/Ex. 1-426). Monkeys and rats exposed to cyanogen at concentrations of 11 or 25 ppm for 6 hours/day, 5 days/week for 6 months showed a reduction in lung moisture content (in both groups of monkeys) and in body weight (rats in the 25-ppm group); the authors concluded that subchronic exposure to 25 ppm is marginally toxic (Lewis,

Anger, and TeVault 1984, in J. Environ. Path. Tox. Oncol. 5:151–163).

Human studies showed that volunteers experienced almost immediate eye and nasal irritation on exposure to a cyanogen concentration of 16 ppm for 6 minutes (McNerney and Schrenk 1960/Ex. 1–426). When the concentration was reduced to 8 ppm, no effects were reported (McNerney, Schrenk 1960/Ex. 1–426).

OSHA is proposing an hour TWA limit of 10 ppm for cyanogen in the agriculture industry. The Agency preliminarily concludes that this limit is necessary to protect workers in this sector against the significant risk of irritation and systemic effects associated with exposure to cyanogen. OSHA believes that this limit will protect workers in this sector from experiencing these material impairments of health. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CYANOGEN CHLORIDE CAS: 506-77-4; Chemical Formula: ClCN H.S. No. 1106

OSHA has no limit for cyanogen chloride in the construction, agriculture, or maritime industries. The ACGIH has a TLV* of 0.3 ppm as a ceiling; NIOSH has no REL for this substance but concurs (Ex. 8-47) with the limit of 0.3 ppm (ceiling) being proposed for cyanogen chloride in construction, maritime, and agriculture. This is the limit recently established for this substance in general industry.

Cyanogen chloride is a colorless liquid or gas (depending on temperature and pressure) that has a pungent odor. It is used in organic synthesis and has been used by the military as a poison gas (ACGIH 1986, p. 155). Cyanogen chloride is also used as a fumigant, as an ingredient in metal cleaners, in the refining of ore, and in the production of synthetic rubber (Sittig 1985, p. 276). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Cyanogen chloride is an irritant of the eyes, mucous membranes, and respiratory tract in both humans and animals; severe exposure may cause pulmonary edema and central nervous system effects (ACGIH 1986, p. 155). The lethal effects of cyanogen chloride are caused by the formation of hydrocyanic acid (Aldridge and Evans 1946/Ex. 1–708). The LC₅₀ in monkeys is 4400 mg/m³ for 1 minute (RTECS 1989). Flury and Zernik (1931d) observed the effects of exposure to cyanogen chloride in five

animal species. In mice, exposure to a concentration of approximately 500 ppm was fatal within 3 minutes; in cats, 120 ppm was fatal in 3.5 minutes; 48 ppm was fatal to dogs in 6 hours; in goats, a 1000-ppm exposure for 3 minutes caused death after 70 hours; and 1200 ppm was fatal to the rabbit. Other studies have demonstrated that animals exposed to cyanogen chloride develop pulmonary edema; interference with cellular metabolism is also an effect of exposure (Jandorf and Bodansky 1946/Ex. 1–334; Aldridge and Evans 1946/Ex. 1–708).

Human data indicate that 1 ppm is the lowest irritant concentration of cyanogen chloride that can be tolerated for a 10-minute exposure; exposure to a 2-ppm concentration was intolerable for this time period, and 4 ppm was fatal in 30 minutes (Prentiss 1937/Ex. 1-1164). The Michigan Department of Health [1977, as cited by ACGIH 1986/Ex. 1-3, p. 155) reported that exposure to a cyanogen chloride concentration of about 0.7 ppm caused eye and nasal irritation severe enough to force workers to evacuate the area. Workers in a cyanogen chloride manufacturing facility reported experiencing the following symptoms of acute overexposure: Dizziness, blurred vision, and nausea (Reed 1920). The signs and symptoms of chronic exposure to this substance included weight loss, muscular weakness, lassitude, skin irritation, and lung congestion (Reed

OSHA is proposing a 0.3-ppm ceiling limit for cyanogen chloride in the construction, agriculture, and maritime industries; this is the limit recently established in general industry. The Agency preliminarily concludes that this limit is necessary to substantially reduce the significant risk of material health impairment (irritation and systemic poisoning) potentially associated with exposure to this substance in agriculture. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CYCLOHEXANE
CAS: 110-82-7; Chemical Formula: C₆H₁₂
H.S. No. 2046

In general industry, construction, and maritime, OSHA currently has an hour time-weighted average (TWA) limit of 300 ppm for cyclohexane. The Agency has no permissible exposure limit (PEL) for this substance in agriculture. The 1987–1988 ACGIH TLV*–TWA is 300 ppm as an 8-hour TWA; NIOSH has no REL. OSHA is proposing an 8-hour TWA of 300 ppm for cyclohexane in agriculture. Promulgation of this limit

will make the PEL for cyclohexane consistent across all regulated sectors.

Cyclohexane is a colorless, mobile liquid at room temperature, and it has a pungent odor that is detectable at a concentration of 300 ppm (Hawley's 1987, p. 335; ACGIH 1986, p. 156). Cyclohexane is used in fungicidal formulations and as a solvent for lacquers, resins, synthetic rubber, fats. and waxes. It is also used as an intermediate in the manufacture of a variety of chemicals and in the industrial recrystallization of steroids (HSDB 1987). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Cyclohexane causes moderate irritation of the eyes and mucous membranes; at high concentrations it causes central nervous system depression (narcosis) in laboratory animals. In animals, the acute toxicity of this substance is low; rabbits exposed to a concentration of 18,500 ppm for 8 hours survived (ACGIH 1986, p. 156). A 1-hour exposure to 26,752 ppm was lethal to all rabbits; acutely poisoned animals showed narcosis, tremor, and, in some animals, tetanic spasm before death (Proctor, Hughes, and Fischman 1988, p. 170). The oral LD50 in rats is 12,705 mg/kg (RTECS 1990). At autopsy, generalized vascular damage and severe degenerative changes in the heart, lungs, liver, kidneys, and brain were seen (Proctor, Hughes, and Fischman 1988, p. 170).

Humans exposed to airborne cyclohexane concentrations of 300 ppm report experiencing eye and mucous membrane irritation (ACGIH 1986, p. 156). Repeated contact of the skin with cyclohexane causes defatting (Proctor, Hughes, and Fischman 1988, p. 170). There have been no reports of systemic poisoning in humans as a result of cyclohexane exposure (Gosselin, Smith, and Hodge 1984, p. II-151).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a PEL, workers in agriculture are at significant risk of experiencing eye and mucous membrane irritation and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA of 300 ppm for cyclohexane in agriculture is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CYCLOHEXENE CAS: 110-83-8 H.S. No. 2047

In general industry, construction, and maritime, OSHA's permissible exposure limit for cyclohexene is 300 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV-TWA® of 300 ppm for this substance; NIOSH has no REL. OSHA is proposing to apply an 8-hour TWA PEL of 300 ppm for cyclohexene in agricultural workplaces. This is the limit recently established for this substance in general industry.

Cyclohexene is a colorless liquid that is used in organic synthesis, in oil extraction, and as a solvent (ACGIH 1986, p. 160). This substance also finds use as a stabilizer for high-octane gasoline (Clayton and Clayton 1982, p. 3233).

Cyclohexene is an eye, skin, and respiratory tract irritant; at high concentrations, this substance also causes central nervous system depression in laboratory animals (Sittig 1985, p. 281; Proctor, Hughes, and Fischman 1988, p. 172). In direct contact with the skin, liquid cyclohexene is a defatting agent (Sittig 1985, p. 281; Proctor, Hughes, and Fischman 1988, p. 172). Dogs exposed by inhalation to an unspecified concentration of cyclohexene showed muscular quivering and staggering gait (Clayton and Clayton 1982, p. 3233). Mice lost their righting reflex after exposure to a cyclohexene concentration of about 9000 ppm, and a single exposure to 15,000 ppm was lethal (Proctor, Hughes, and Fischman 1988, p. 172). In a 6-month inhalation study of rats, rabbits, and guinea pigs that involved repeated exposures to 75, 150, 300, or 600 ppm cyclohexene, all rats showed an increase in alkaline phosphatase, and the high-dose rats gained weight more slowly than did controls; no other significant exposure-related effects were seen (Clayton and Clayton 1982, p. 3233; Proctor, Hughes, and Fischman 1988, p. 172). Cyclohexene is believed to have relatively low toxicity in mammals because it is rapidly metabolized and eliminated (Clayton and Clayton 1982, p.

Although no toxic effects have been reported in humans exposed to cyclohexene, this substance is regarded as a mild respiratory irritant and central nervous system depressant based on effects seen in animals (Proctor, Hughes, and Fischman 1988, p. 172; ACGIH 1986, p. 160).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at a significant risk of experiencing the eye,

skin, and respiratory irritation associated with exposure to cyclohexene and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA PEL of 300 ppm will substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

CYCLOPENTADIENE
CAS: 542-92-7; Chemical Formula: C₆H₆
H.S. No. 2048

OSHA's current PEL for cyclopentadiene in general industry, construction, and maritime workplaces is 75 ppm as an 8-hour time-weighted average (TWA). OSHA has no PEL for this substance in agriculture. The 1987–1988 ACGIH TLV*—TWA was 75 ppm for this substance; there is no NIOSH REL for cyclopentadiene. OSHA is proposing an 8-hour TWA of 75 ppm for cyclopentadiene in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

Cyclopentadiene is a volatile, colorless liquid that polymerizes easily on standing to the dimer dicyclopentadiene. This substance has an irritating odor that is similar to that of terpene (ACGIH 1986, p. 163). Cyclopentadiene is used as a starting material for chlorinated insecticides, synthetic prostaglandin, and the formation of sandwich compounds by chelation. Cyclopentadiene is also used in the manufacture of resins and in organic synthesis (HSDB 1986; Hawley's 1987, p. 338).

Cyclopentadiene causes irritation, dermatitis, and sensitization in humans; in laboratory animals, it has been reported to cause injury to the liver and kidneys as well as irritation and narcosis. The oral LD50 for the dimer in rats is 0.82 g/kg, and the LCso in the same species is 39 g/m3 for the monomer (Clayton and Clayton 1981, p. 3239; RTECS 1990). The dermal LDso in rabbits is 6.7 ml/kg (Clayton and Clayton 1982, p. 3239). Subcutaneous injection of 3.0 ml cyclopentadiene caused narcosis and fatal convulsions in rabbits (Clayton and Clayton 1982, p. 3239). Mild injury of the liver and kidneys was seen at autopsy in rats exposed to a 500-ppm concentration of cyclopentadiene for 7 hours/day for 35 days (over a period of 53 days) (Proctor, Hughes, and Fischman 1988, p. 174). No ill effects were noted by observation, clinical tests, or histologic examination in dogs exposed to a 400ppm concentration for 6 hours, for 39 episodes, followed by 15 exposures to 00

ppm (Proctor, Hughes, and Fischman 1988, p. 174).

Humans exposed to cyclopentadiene at concentrations of 250 and 500 ppm experienced a sensory response described as distinctly unfavorable (ACGIH 1986, p. 163). Cyclopentadiene has caused contact dermatitis and sensitization in humans (Grant 1974, p. 343).

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to this substance at the levels permitted by the absence of a limit are at significant risk of experiencing irritation and of developing dermatitis and, in some cases, sensitization. The Agency believes that establishing a PEL of 75 ppm as an 8hour TWA will protect workers in agriculture from these significant risks. which are material impairments of health within the meaning of the Act. In addition, promulgation of this limit with make OSHA's Pel for this substance consistent across all regulated sectors. DIACETONE ALCOHOL

CAS: 123-42-2; Chemical Formula: [CH₃]₂C(OH)CH₂COCH₃ H.S. No. 2052

OSHA's PEL for diacetone alcohol in general industry, construction, and maritime workplaces is 50 ppm as an 8-hour time-weighted average (TWA); there is no PEL in agriculture. The 1987–1988 ACGIH TLV*-TWA was 50 ppm, and this is also the NIOSH REL. OSHA is proposing an 8-hour TWA PEL of 50 ppm for diacetone alcohol in agriculture. Promulgation of this limit will make the PEL for diacetone alcohol consistent across all regulated sectors.

Diacetone alcohol is a colorless liquid with a faint and pleasant odor (HSDB 1990). It is used as a chemical intermediate in organic synthesis and as a solvent for cellulose compounds, fats, oils, waxes, resins, and certain pigments. In addition, it is used in some antifreeze solutions, hydraulic fluids, photographic films, and quick-drying inks and also finds use as a preservative in pharmaceuticals (HSDB 1990).

Diacetone alcohol is primarily an irritant of the eyes, mucous membranes, and respiratory tract; however, at high concentrations, it causes narcosis in laboratory animals. The oral LD₅₀ in rats is 4000 mg/kg; the dermal LD₅₀ in rabbits is 13,500 mg/kg; other studies indicated that an oral dose of 2 ml/kg produced transient liver damage in rats and that a dose of 4 ml/kg killed the animals (RTECS 1991; Clayton and Clayton 1982, p. 4755). Narcosis was produced in rabbits by single doses ranging from 2.4 to 4.0 ml/kg, and a dose of 5 ml/kg was lethal (Clayton and Clayton 1982, p.

4755). Exposure to 2100 ppm for 1 to 3 hours caused animals to exhibit signs of restlessness, mucous membrane irritation, and drowsiness (Proctor, Hughes, and Fischman 1988, p. 179). Application of pure diacetone alcohol to the skin of rabbits produced mild skin irritation, but moderate to severe eye irritation and transient corneal damage occurred when this substance was dropped into rabbit eyes (RTECS 1991; Clayton and Clayton 1982, p. 4755).

Most human subjects experienced eye, nose, and throat irritation during an exposure to a 100-ppm concentration of diacetone alcohol for 15 minutes. At the 100-ppm concentration, humans also experienced headaches, nausea, and vomiting (RTECS 1990). At a concentration of 400 ppm, these volunteers reported chest discomfort (RTECS 1991; Proctor, Hughes, and Fischman 1988, p. 178). Repeated or prolonged skin contact may cause defatting of the skin and dermatitis, and eye contact will cause moderate to marked irritation and transient corneal damage (Proctor, Hughes, and Fischman 1988, p. 178).

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to this substance at the levels permitted by the absence of a limit are at significant risk of experiencing irritation of the eyes. mucous membranes, and respiratory tract. At high concentrations, they may also be at risk of experiencing narcotic effects. The Agency believes that establishing a PEL of 50 ppm as an 8hour TWA for diacetone alcohol is necessary to protect workers in agriculture from these significant risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

DIAZOMETHANE
CAS: 334-88-3; Chemical Formula:
CH₂N₂
H.S. No. 2053

In general industry, construction, and maritime, OSHA's permissible exposure limit for diazomethane is 0.2 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 0.2 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 0.2 ppm for diazomethane. This is the limit recently established for this substance in general industry.

Diazomethane is a yellow gas with a musty odor. Its only use is as a methylating agent in chemical laboratories (HSDB 1984; Clayton and Clayton 1981, p. 2784).

Exposure to diazomethane causes severe eye and respiratory tract irritation and skin and respiratory sensitization in both animals and humans; this substance has also produced cancer and teratogenic effects in animals. Inhalation exposure caused pulmonary edema, hemorrhagic emphysema, and bronchopneumonia in exposed cats, rabbits, and guinea pigs (IARC 1974, p. 226). Cats exposed to a 175-ppm concentration of diazomethane for 10 minutes died within 3 days of pulmonary edema and hemorrhage of the lungs (Clayton and Clayton 1981, p. 2785). In guinea pigs, repeated applications of diazomethane in a cottonseed oil or dioxane vehicle caused skin sensitization (Clayton and Clayton 1981, p. 2785). In skin painting and inhalation bioassays in mice and rats, diazomethane caused an increased incidence of lung tumors (IARC 1974, p. 228). Diazomethane is mutagenic in bacterial test systems (RTECS 1990).

In humans, diazomethane is a severe respiratory tract irritant and allergen that causes, even in very low concentrations, the following effects: coughing, fever, chest pains, cyanosis, fulminating pneumonia, and, occasionally, death. Exposure can lead to hypersensitivity, which is manifested as asthma and fever (Parmeggiani 1983, pp. 620-621). Two persons exposed to unspecified concentrations of diazomethane developed dizziness, headache, chest pain, fever, and severe asthmatic symptoms beginning about 5 hours after exposure. Other exposures to this substance have resulted in cyanosis. pulmonary edema, weakness, chest pain, pneumonia, and death (ACGIH 1986, p. 173). Hepatic enlargement and hemolysis also are reported to result from exposure to diazomethane (Clayton and Clayton 1981, p. 2785). Diazomethane is irritating to the eyes and could cause serious ocular damage. and skin contact with this substance leads to denudation of the skin and mucous membranes (Clayton and Clayton 1981, p. 2785).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the respiratory tract and other irritation associated with exposure to diazomethane. The Agency believes that establishing an 8-hour TWA PEL of 0.2 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

DIBUTYL PHOSPHATE

CAS: 107-66-4; Chemical Formula: (n-C4H9O)2(OH)PO H.S. No. 1119

OSHA currently has an 8-hour TWA PEL of 1 ppm for dibutyl phosphate in the construction and maritime industries. The Agency has no PEL in agriculture for this substance. The ACGIH has a TLV*-TWA of 1 ppm and a TLV*-STEL of 2 ppm for dibutyl phosphate; there is no NIOSH REL, but NIOSH concurs with the PELs being proposed (Ex. 8-47). The Agency is retaining the 8-hour TWA PEL in construction and maritime, is proposing a 2 ppm STEL in these two sectors, and is proposing both limits in agriculture. These are the limits recently established for this substance in general industry.

Dibutyl phosphate is a pale amber liquid that is used as an organic catalyst in the manufacture of phenolic and urea resins and as an antifoaming agent (ACGIH 1986, p. 175; Hawley's 1987, p.

Dibutyl phosphate is an irritant of the eyes, mucous membranes, skin, and upper respiratory tract. The oral LD50 in rats is 3.2 g/kg (Proctor, Hughes, and Fischman 1988, p. 183). In a personal communication to the ACGIH. Mastromatteo reported that workers exposed to relatively low concentrations of dibutyl phosphate developed respiratory tract irritation and headache (Mastromatteo 1964a, as cited in ACGIH 1986/Ex. 1-3, p. 236). Workers exposed to an unspecified concentration of dibutyl phosphate also reportedly experienced headaches (ACGIH 1986, p. 175). Repeated contact of dibutyl phosphate with the skin causes dermatitis (Genium MSDS 1987, No.

ÓSHA preliminarily concludes that both a TWA and a STEL are necessary to protect workers in construction, maritime, and agriculture from the significant risk of eye, skin, and respiratory tract irritation and headaches reported to occur among workers exposed to low concentrations of this substance. The Agency considers these exposure-related effects to be material impairments of health within the meaning of the Act. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors. O-DICHLOROBENZENE CAS: 95-50-1; Chemical Formula:

C6H4Cl2 H.S. No. 2057

In general industry, construction, and maritime, OSHA's current permissible exposure limit for o-dichlorobenzene is 50 ppm as a ceiling. There is no OSHA limit for o-dichlorobenzene in

agriculture. The ACGIH has a ceiling limit for this substance of 50 ppm, with a skin notation; NIOSH has no REL OSHA is proposing a 50 ppm ceiling limit for o-dichlorobenzene in agriculture; this action will ensure consistency in the exposure limit for this substance across all OSHA-regulated

o-Dichlorobenzene is a colorless to pale yellow liquid with a pleasant odor (Hazardous Substance Fact Sheet 1985, p. 1). There are many uses for odichlorobenzene; it is used as an insecticide against termites and locust borers; a fumigant; a degreasing agent; a heat transfer medium; to remove sulfur from illuminating gas; and in the manufacture of dyes (Merck 1983, p. 444). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

In both humans and animals, odichlorobenzene is an irritant of the eyes, nose, upper respiratory tract, and skin; at high concentrations, this substance also causes central nervous system depression. In humans, exposure to high concentrations of odichlorobenzene has also caused blood dyscrasias. The oral LD₅₀ in rats is 500 mg/kg (RTECS 1991). The lowest reported lethal concentration in rats is 4946 mg/m3 (821 ppm) for 7 hours (Hollingsworth et al. 1958, in IARC 1982, Vol. 29, p. 228). Rabbits experienced mild eye irritation after 100 mg of odichlorobenzene had been instilled into their eyes and was left for 30 seconds before being rinsed out (RTECS 1991). Repeated application of odichlorobenzene to the skin of rats caused death, indicating that this substance can be absorbed through the skin in lethal amounts (U.S. EPA 1985, in Proctor, Hughes, and Fischman 1988, p. 184). Rats exposed to a 977-ppm concentration of o-dichlorobenzene for 2 hours survived; however, exposure to the same concentration for 7 hours was fatal to these animals. No deaths occurred among rats exposed for 3 hours to a 539-ppm concentration of odichlorobenzene, but autopsy revealed marked centrilobular necrosis of the liver and cloudy swelling of the tubular epithelium of the kidney (Hollingsworth et al. 1958, in IARC 1982, Vol. 29). Liver damage was also reported in a study involving exposure to o-dichlorobenzene concentrations of 50 to 800 ppm for a few hours (Cameron and Thomas 1937, in ACGIH 1986, p. 178). Several species of experimental animals (rats, rabbits, and guinea pigs) showed no adverse effects from exposure to this substance

at a concentration of 93 ppm for 7

hours/day for 6 or 7 months (Hollingsworth et al. 1958).

In humans, exposure to an odichlorobenzene concentration of 25 or 30 ppm causes eye irritation (AIHA 1964). After prolonged contact with the skin, o-dichlorobenzene causes blistering, and the skin may subsequently become pigmented; dermal sensitization has also been reported (Hollingsworth et al. 1958). Ten of 26 volunteers accidentally exposed to unspecified concentrations of odichlorobenzene for hours/day for 4 days experienced dizziness, severe headache, fatigue, and nausea, in addition to eye, nose, and throat irritation (Zapata-Gayon et al. 1982, in Proctor, Hughes, and Fischman 1988, p. 184]. This study also reported significant alterations in the leukocytes of these individuals; these changes were not evident 6 months after exposure ended. A 40-year-old worker exposed for 22 years to o-dichlorobenzene (concentration unspecified) during the preparation of dyestuffs suffered from purpura, anemia, hepatomegaly, and splenic enlargement; death was attributed to o-dichlorobenzene-related proliferating myelosis (Tolot et al. 1969, in Clayton and Clayton 1981, p. 3615). Another 40-year-old worker developed chronic lymphatic leukemia after 10 years of occupational exposure to a solvent containing 80 percent o-, 15 percent p-, and 2 percent mdichlorobenzene (Clayton and Clayton 1981, p. 3615).

Based on this evidence in humans and animals, OSHA preliminarily concludes that o-dichlorobenzene causes irritation of the eyes, nose, and skin, central nervous system depression, liver and kidney damage, and blood dyscrasias. OSHA therefore believes that, in the absence of a limit for o-dichlorobenzene, workers in agriculture are at significant risk of experiencing these adverse health effects. The Agency believes that the proposed ceiling limit of 50 ppm is necessary to substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

1,3-DICHLORO-5,5-DIMETHYL HYDANTOIN

CAS: 118-52-5; Chemical Formula: C5H6Cl2N2O2 H.S. No. 1122

OSHA currently has a limit of 0.2 mg/ m3 as an 8-hour TWA for 1,3-dichloro-5,5-dimethyl hydantoin (DCDMH) in the construction and maritime industries. The Agency has no PEL for DCDMH in agriculture. The ACGIH has a TLV*-

TWA of 0.2 mg/m3 and a TLV*-STEL of 0.4 mg/m3 for this substance; there is no NIOSH REL. The Agency is proposing PELs of 0.2 mg/m3 as an 8-hour TWA and 0.4 mg/m3 as a 15-minute STEL for DCDMH in the construction, agriculture, and maritime industries. OSHA recently established these limits in general industry, and NIOSH (Ex. 8-47) concurs that these limits are appropriate for DCDMH. Promulgation of the PELs will make OSHA's limits for DCDMH consistent across all regulated sectors.

1,3-Dichloro-5,5-dimethyl hydantoin is a white powder with a slight chlorinelike odor. It is used as a chlorinating agent, a chemical intermediate in the production of insecticides, drugs, and amino acids, and as a stabilizer for vinyl chloride polymers (ACGIH 1986, p. 183).

1,3-Dichloro-5,5-dimethyl hydantoin produces systemic toxicity in laboratory animals and irritation of the respiratory tract in humans (Proctor, Hughes, and Fischman 1988, p. 138). The acute oral LDse in rats of both sexes is 542 ±84 mg/kg when a 10-percent aqueous suspension of DCDMH is administered. At autopsy, rats dying within 48 hours of administration showed gastrointestinal hemorrhages (Industrial Bio-Test Laboratories 1961 and 1962, as cited in ACGIH 1986/Ex. 1-3, p. 183). The lowest lethal concentration in rats is 20 g/m3 for 4 hours (RTECS 1990). Applied to the skin of rabbits (100 mg) for 24 hours. DCDMH caused severe injury [RTECS 1990).

Limited exposure data for humans were reported by Baier, who stated that individuals experienced extreme respiratory irritation at an average DCDMH concentration of 1.97 mg/m3. but that some experienced this degree of irritation even at a concentration of 0.7 mg/m³ (Baier 1964, as cited in ACGIH 1986/Ex. 1-3, p. 183). In contact with the eyes, this substance forms hypochlorous acid and therefore causes severe irritation (Proctor, Hughes, and Fischman 1988, p. 188).

The 0.2-mg/m3 8-hour TWA PEL and 0.4-mg/m3 15-minute STEL that the Agency is proposing for workplaces in the construction, maritime, and agriculture industries are based on evidence of DCDMH's systemic toxicity in laboratory animals and respiratory irritation at low exposure concentrations in human subjects. The Agency preliminarily concludes that both a TWA and a STEL are necessary to substantially reduce the significant risk of material health impairment that is associated with exposure to this substance. The proposed limits are those recently established for this substance in general industry.

DICHLOROETHYL ETHER CAS: 111-44-4; Chemical Formula: CH2ClCH2)20 H.S. No. 1127

OSHA currently has a 15-ppm ceiling limit, with a skin notation, for dichloroethyl-ether in the construction and maritime industries. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 5 ppm and a TLV*-STEL of 10 ppm, with a skin notation, for dichloroethyl ether. NIOSH has no REL for this substance but concurs with the limits being proposed. The Agency is proposing a 5 ppm TWA and a 10 ppm STEL for dichloroethyl ether in agriculture, construction, and maritime. These are the limits recently established for dichloroethyl ether in general industry.

Dichloroethyl ether is a colorless, flammable liquid with a nauseating odor. It is used as a soil fumigant, a solvent, a dewaxing agent, a chemical intermediate, a wetting agent, and as a penetrant (ACGIH 1986, p. 186). Dichloroethyl ether also finds use as an ingredient of paints, paint removers, dry-cleaning fluids, lacquers, and varnishes [IARC 1975, Vol. 9, p. 119]. When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and

Rodenticide Act (FIFRA). Dichloroethyl ether causes severe irritation of the eyes, mucous membranes, skin, and respiratory tract in both animals and humans; at high concentrations, it causes narcosis. This substance has also been shown to cause cancer in mice. The oral LG50 in rats is 75 mg/kg; the dermal LG50 in rabbits is 720 mg/kg; and the LCso in rats is 330 mg/m3 for 4 hours (RTECS 1991). Schrenk, Patty, and Yant (1933/Ex. 1-665) reported that guinea pigs exposed to the vapor of dichleroethyl ether at a concentration of 500 ppm experienced immediate and severe eye and nose Irritation, respiratory disturbances after 1.5 to 3 hours, and death after 5 to 8 hours; lung, kidney, liver, and brain damage were observed in these animals at autopsy. Exposure to a reduced concentration of 105 ppm caused death after 10 hours of continuous exposure, while a 18-hour exposure to the same concentration caused irritation only (Carpenter, Smyth, and Pozzani 1949/Ex. 1-722). At 35 ppm, for an unspecified duration, irritation but no other adverse effects were observed [Schrenk, Patty, and Yant 1933/Ex. 1-665). Rats responded similarly; 4-hour exposures to a concentration of 250 ppm proved lethal to these animals (Carpenter,

Smyth, and Pozzani 1949/Ex. 1-722). Repeated exposures to 69 ppm (7 hours/ day, 5 days/week for 130 days) caused no serious injury in rats or guinea pigs; only mild stress-related effects were noted (Kosyan 1967/Ex. 1-914). However, other studies of guinea pigs have shown mild primary irritative effects on the skin, and fatalities occurred when 300 mg/kg was applied dermally as a pure liquid for 24 hours (Smyth and Carpenter 1948/Ex. 1-375). Direct contact of dichloroethyl ether with the eye causes moderate pain, conjunctival irritation, and transient corneal injury (Carpenter and Smyth 1946/Ex. 1-859). In oral carcinogenicity bioassays, dichloroethyl ether has caused an increased incidence of hepatomas in two strains of mice (IARC 1975, Vol. 9, p. 121). By subcutaneous administration, this substance has also caused a low incidence of injection-site tumors in mice [IARC 1975, Vol. 9, p. 121).

Humans exposed briefly to dichloroethyl ether at concentrations above 550 ppm experienced intolerable eye and nasal irritation, with coughing, nausea, and retching. Exposure to concentrations between 100 and 260 ppm were irritating but tolerable; however, the odor of dichloroethyl ether continued to be nauseating even at 35 ppm (Schrenk, Patty, and Yant 1933/Ex. 1-665). Eye irritation has been reported from industrial exposure to a concentration of dichloroethyl ether of 2.5 ppm (Bell and Jones 1958/Ex. 1-714). A single fatality, presumably from inhalation of dichloroethyl ether vapor, has been reported but not documented (Elkins 1959c, as cited in ACGIH 1986/ Ex. 1-3, p. 186).

OSHA is proposing a 5 ppm TWA and 10 ppm STEL, with a skin notation, for this substance in construction, maritime, and agriculture. The Agency preliminarily concludes that these limits are necessary to substantially reduce the significant risk of irritation, lung injury, and nausea associated with occupational exposure to elevated levels of dichloroethyl ether. OSHA considers these exposure-related effects material impairments of health. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors. 2,2-DICHLOROPROPIONIC ACID CAS: 75-99-0; Chemical Formula:

CH₃CCl₂COOH

H.S. No. 1130

OSHA has no limit for 2,2dichloropropionic acid in the construction, maritime, or agriculture industries. The ACGIH has a TLV-

TWA of 1 ppm for this substance; there is no NIOSH REL. The Agency is proposing a 1 ppm 8-hour TWA for 2,2-dichloropropionic acid in the construction, agriculture, and maritime industries. This is the limit recently established for this substance in general industry, and NIOSH (Ex. 8-47) concurs that it is appropriate.

2,2-Dichloropropionic acid is a colorless liquid. It is used as a herbicide both in agricultural and non-crop applications (ACGIH 1986, p. 190; Sittig 1985, p. 332). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

2,2-Dichloropropionic acid is corrosive to the skin and may cause permanent eye injury (ACGIH 1986, p. 190). The oral LD₅₀ in rats is 970 mg/kg (RTECS 1991). Percutaneous absorption for this substance is reported to be negligible (Gosselin, Smith, and Hodge 1984, p. II–341). Application of 100 μ g/m³ to the skin of rabbits for 24 hours caused irritation (RTECS 1991). Seven-hour exposures to a saturated atmosphere of the acid vapor caused no ill effects in rats, and a 120-day study of dietary exposure in rats showed a no-effect level of 15 mg/kg/day (ACGIH 1986, p. 190).

Acute human exposures to 2,2-dichloropropionic acid have been reported to cause mild to moderate skin, eye, and respiratory irritation. Minimal respiratory irritation was observed in workers exposed to concentrations of between 2 and 7 ppm (ACGIH 1986, p. 190). Repeated or prolonged contact may cause mild skin burns, and eye contact causes transient corneal injury (HSDB 1985). The signs and symptoms of systemic poisoning caused by 2,2-dichloropropionic acid include anorexia, nausea, and sweating (Hazardous Substance Fact Sheet 1986).

The Agency preliminarily concludes that a 1-ppm TWA limit for 2,2-dichloropropionic acid will protect workers in construction, maritime, and agriculture from the significant risk of eye, skin, and respiratory irritation associated with exposure to this substance. The Agency considers these exposure-related effects to be material impairments of health. The proposed PEL is the limit recently established for this substance in general industry.

DIETHYLAMINE CAS: 109-89-7; Chemical Formula: (C₂H₆)₂NH H.S. No. 1137

OSHA's current limit for diethylamine in the construction and maritime industries is 25 ppm as an hour TWA.

The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 10 ppm and a TLV*-STEL of 25 ppm for diethylamine; there is no NIOSH REL for this substance. OSHA is proposing a PEL of 10 ppm as an 8-hour TWA and a STEL of 25 ppm for diethylamine in the construction, agriculture, and maritime industries. These limits were recently established for this substance in general industry, and NIOSH (Ex. 8-47) concurred that these limits were appropriate for diethylamine.

Diethylamine (DEA) is a colorless liquid with an ammonia-like odor. It is used in pharmaceuticals and dyes, as a flotation agent, and in the rubber and petroleum industries (ACGIH 1986, p. 197). DEA also finds use as a chemical intermediate in the synthesis of rubber processing chemicals and other substances (HSDB 1985).

Diethylamine is a strong irritant of the eyes, skin, and mucous membranes in both animals and humans; multiple exposures of laboratory animals to sublethal concentrations of DEA cause tracheitis, bronchitis, pneumonitis, and pulmonary edema (Proctor, Hughes, and Fischman 1988, p. 199; ACGIH 1986/Ex. 1-3, p. 197). The oral LD50 in rats is 540 mg/kg, the dermal LDso in rabbits is 820 mg/kg, and the 48-hour LC50 in rats is 4000 ppm (RTECS 1991). Instillation of 1 percent or greater solutions of DEA into the eyes of rabbits causes corneal opacity (injury graded 10 on an ascending severity scale of 1 to 10) (RTECS 1991; Grant 1986, p. 333; Sutton 1963/Ex. 1-1101), and direct contact of the skin with diethylamine causes necrosis (ACGIH 1986, p. 197). Rabbits exposed 7 hours/day, 5 days/week for 6 weeks to a 50- or 100-ppm concentration of diethylamine survived; those exposed to a 50-ppm concentration showed marked lung and corneal irritation, and, occasionally, myocardial degeneration (Brieger and Hodes 1951/Ex. 1-408). In the animals exposed to 100 ppm, these changes were more severe, and degeneration of the heart muscle was marked (Brieger and Hodes 1951/Ex. 1-

In humans, inhalation of high concentrations of diethylamine causes severe cough and chest pain; if exposure is repeated or prolonged, pulmonary edema may occur. One individual was splashed in the eye with diethylamine and subsequently experienced intense pain; despite treatment, some permanent visual impairment occurred (Proctor, Hughes, and Fischman 1988, p. 199). Vesiculation and necrosis of the skin occurs if liquid diethylamine contacts the skin (AIHA Hygienic Guide Series 1960).

Based on this evidence in humans and animals, OSHA preliminarily concluded that the limits being proposed in construction, maritime, and agriculture—10 ppm as an 8-hour TWA and 25 ppm as a 15-minute STEL—are necessary to reduce the significant risk of material impairment of health associated with exposure to DEA. These are the limits recently established for this substance in general industry.

DIETHYLAMINOETHANOL CAS: 100–37–8; Chemical Formula: (C₂H₅)₂NCH₂CH₂OH H.S. No. 2062

In general industry, construction, and maritime, OSHA's current permissible exposure limit for 2-diethylaminoethanol is 10 ppm as an 8-hour TWA, with a skin notation. The ACGIH has a TLV*-TWA of 10 ppm, also with a skin notation, for this substance; there is no NIOSH REL. OSHA is proposing that a 10-ppm 8-hour TWA PEL, and a skin notation, apply in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

2-Diethylaminoethanol is a colorless liquid with a weak odor similar to that of ammonia (Sittig 1985, p. 343). This substance is used as a curing agent for resins, an emulsifying agent, a fabric softener, a chemical intermediate for petroleum and gas-processing chemicals, cosmetics, and surface coatings, and in pharmaceutical manufacture (HSDB 1985; Sittig 1985, p. 343; ACGIH 1986, p. 198).

2-Diethylaminoethanol is an irritant of the eyes, skin, and mucous membranes. The liquid is a severe irritant of the eyes and skin and causes skin sensitization in laboratory animals; however, data on the toxic effects of exposure to this substance are very limited for humans. although nausea and vomiting have been reported. The oral LD50 in rats is 1300 mg/kg, and the dermal LD50 in rabbits is 1260 mg/kg (RTECS 1990). Instilled into rabbit eves, 5 milligrams produced severe irritation (RTECS 1990). Marked eye and nasal irritation was exhibited by rats on the first day of exposure to a 500-ppm concentration for 6 hours. Mild tremors of the forelegs and head occurred throughout the 5-day study and, by the third exposure, corneal opacity was noted in several animals. All rats showed weight loss, and four of 20 died by the fifth exposure. Acutely poisoned animals showed purulent bronchitis and bronchopneumonia at autopsy (ACGIH 1986, p. 198; Proctor, Hughes, and Fischman 1988, p. 200). In guinea pigs, the liquid has been shown to be a severe irritant of the skin and to cause skin

sensitization (Proctor, Hughes, and Fischman 1988, p. 200).

A reported human exposure to this substance involved the brief inhalation of a 100-ppm concentration of diethylamino-ethenol and resulted in nausea and vomiting within 5 minutes of the onset of exposure (Proctor, Hughes, and Fischman 1988, p. 200).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing eye, skin, and respiratory irritation and nausea associated with exposure to diethylaminoethanol. The Agency believes that establishing an 8-hour TWA of 10 ppm, with a skin notation, is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

DIISOBUTYL KETONE CAS: 108-83-8; Chemical Formula: [(CH₂)₂CHCH₂]₂CO H.S. No. 1140

OSHA currently has an hour TWA limit of 50 ppm for diisobutyl ketone in the construction and maritime industries. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 25 ppm for diisobutyl ketone, which is also the NIOSH REL. OSHA is proposing a PEL of 25 ppm as an 8-hour TWA for diisobutyl ketone in the construction, agriculture, and maritime industries. This is the limit recently established for this substance in general industry.

The primary health effects associated with exposure to diisobutyl ketone are eye, nose, and throat irritation, although experimental animals have shown some systemic effects and at high concentrations have shown narcotic effects. The oral LD50 in rats is 5750 mg/ kg, the lowest lethal concentration in the same species is 2000 ppm for 4 hours, and the dermal LDse in rabbits is 16 g/kg (RTECS 1990). Rats and guinea pigs survived single exposures lasting for 7.5 to 16 hours to essentially saturated vapor (McOmie and Anderson 1949/Ex. 1-916). Smyth, Carpenter, and Weil (1949/Ex. 1-528) reported that five of six rats were narcotized and died after exposure to a concentration of 2000 ppm for hours. At autopsy, acutely poisoned animals showed damage of the lungs, liver, and kidneys (Carpenter, Pozzani, and Weil 1953). Direct application of diisobutyl ketone to rabbit skin caused only mild irritation, and no eye irritation was reported after instillation of this substance into rabbit eyes (Smyth, Carpenter, and Weil 1949/Ex. 1-528).

Carpenter and Smyth (1946/Ex. 1-859) reported a no-effect level for diisobutyl ketone of 125 ppm in rats and guinea pigs given 30 7-hour exposures. At a concentration of 250 ppm on the same regimen, the liver and kidney weights of female rats increased and the liver weights of male guinea pigs decreased: at concentrations of 530 and 920 ppm, rats showed increased liver and kidney weights at autopsy, and an increase in mortality was noted when the concentration reached 1650 ppm (Carpenter and Smyth 1946/Ex. 1-859). Daily diisobutyl ketone doses of 4000 mg/kg administered by gavage killed all rats after 2 or 3 days. Severe central nervous system depression, hepatotoxicity, and dehydration were the cause of death in these acutely poisoned animals (Clayton and Clayton 1982, p. 4770).

Silverman, Schulte, and First (1946/Ex. 1–142) reported that volunteers experienced eye irritation and complained of objectionable odor when exposed to concentrations of disobutyl ketone above 25 ppm. At a 100-ppm concentration for 3 hours, these subjects experienced lacrimation, throat irritation, headaches, and dizziness (Silverman, Schulte, and First (1946/Ex. 1–142).

Based on this evidence, OSHA preliminarily concludes that the proposed 25-ppm limit is necessary to reduce the significant risk of irritation, headaches, and dizziness associated with workplace exposures to disobutyl ketone. This is the limit recently established for this substance in general industry. The Agency considers these exposure-related effects material impairments of health and believes that the proposed PEL will substantially reduce these risks for workers in construction, maritime, and agriculture. DIMETHYLAMINE

CAS: 124-40-3; Chemical Formula: [C₂H₅]₂NH H.S. No. 2066

In general industry, construction, and maritime, OSHA's permissible exposure limit for dimethylamine is 10 ppm as an 8-hour time-weighted average (TWA). There is no limit in agriculture for this substance. The 1987–1988 ACGIH TLV*–TWA for this substance is 10 ppm; NIOSH has no REL for dimethylamine. OSHA is proposing an 8-hour TWA PEL of 10 ppm for dimethylamine in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

Dimethylamine is a gas at room temperature and has a strong ammonialike odor (HSDB 1985; Hawley's 1987, p. 409). It is used as a propellant for pesticides, a chemical intermediate, an accelerator in vulcanizing rubber, and as an attractant for boll weevils (to facilitate their extermination). Dimethylamine is also used as an acid gas absorbent, a dehairing agent, a gasoline stabilizer, and an ingredient in missile fuels, rocket propellants, and pharmaceuticals (HSDB 195; Hawley's 1987, p. 410).

Dimethylamine is an irritant of the eyes, mucous membranes, and respiratory tract in both animals and humans (Proctor, Hughes, and Fischman 1988, p. 207; ACGIH 1986, p. 208). The 6hour LCoo in rats is 4540 ppm, and the oral LD508 in mice, rats, and guinea pigs are 316 mg/kg, 698 mg/kg, and 240 mg/ kg, respectively (RTECS 1990). Severe irritation of the gastric mucosa, accompanied by hemorrhage in the stomach wall, was noted in animals acutely poisoned by oral administration (ACGIH 1986, p. 206). Signs of eye irritation, gasping, tearing, salivation. and bloody discharge from the nose were noted in rats that died after exposure for 1 hour to a 4540-ppm concentration. Corneal opacity occurred 3 hours after the exposure began, and death was usually preceded by convulsions; at autopsy, severe congestion, ulceration, and necrosis of the nasal turbinates were observed (Steinhagen et al. 1982). At concentrations greater than 2500 ppm, emphysema, bronchopneumonia, liver cell death, and corneal ulceration occurred in acutely poisoned animals (Steinhagen et al. 1982). Animals of several species were repeatedly exposed to concentrations of approximately 100 to 200 ppm of dimethylamine for 18 to 20 weeks and developed marked irritation of the respiratory tract and pulmonary edema and also sustained injury to the liver (McNulty 1983). Among the guinea pigs and rabbits exposed on this regimen, corneal injury was observed after 9 days of exposure; degenerative changes of the testicles occurred in one monkey and one of ten rats in these experiments (ACGIH 1988, p. 208). Continuous exposure to a 5 ppm dimethylamine concentration for 90 days resulted in no overt signs of toxicity in experimental animals of several species, but autopsy showed inflammatory changes in the lungs (Coon et al. 1970). Skin contact with dimethylamine results in necrosis. and eye contact causes severe corneal injury or permanent corneal opacity (Proctor, Hughes, and Fischman 1988, p. 207; Grant 1986, p. 348).

In humans, contact of the eyes with this substance causes intense pain, severe damage, and may cause permanent corneal opacity (Grant 1986, p. 348). Skin contact with the liquid may cause minor irritation on short contact; on longer contact, necrosis of the skin is possible (Genium MSDS 1986, No. 588). Dermatitis and conjunctivitis have both been reported to occur in chemical workers chronically exposed to this substance (Proctor, Hughes, and Fischman 1988, p. 207). By analogy with effects seen in animals, sublethal doses could result in delayed tracheitis, bronchitis, pulmonary edema, and pneumonitis, and ingestion could lead to gastric irritation and hemorrhage (ACGIH 1986a, p. 207).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye, mucous membrane, and respiratory tract irritation associated with exposure to dimethylamine. The Agency believes that establishing an 8-hour TWA PEL of 10 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. DIMETHYLPHTHALATE CAS: 131-11-3; Chemical Formula: CaHa(COOCHa)

H.S. No. 1138

OSHA's PEL for dimethylphthalate in general industry, construction, and maritime is 5 mg/m³ as an 8-hour TWA; there is no PEL in agriculture. The ACGIH TLV³-TWA for dimethylphthalate is 5 mg/m³ as an 8-hour TWA; there is no NIOSH REL for this substance. OSHA is proposing an 8-hour TWA PEL of 5 mg/m³ for dimethylphthalate in agriculture. This action will make the PEL for this substance consistent across all OSHA-regulated sectors.

Dimethylphthalate is a colorless, viscous liquid with a slightly aromatic, ester-like odor (Clayton and Clayton 191, p. 2343; HSDB 1991). It is primarily used as a solvent and plasticizer. Since World War II, dimethylphthalate has been used as an insect repellant; this substance is also an effective leech repellant. Dimethylphthalate also finds use as an ingredient in solid rocket propellants, lacquers, coating agents, safety glass, molding powders, and perfumes (HSDB 1987).

Dimethylphthalate is an irritant of the eyes and mucous membranes in both animals and humans; embryotoxic and fetotoxic effects have been reported in animals. The oral LD₅₀s in rats and mice are 6800 mg/kg (both species); the lowest lethal concentration in cats is 9630 mg/m³ for 6 hours (RTECS 1991).

Applied to 10 percent of the body surface of rabbits for 90 days at a dose of 4.0 mg/kg, dimethylphthalate caused death in some animals; at autopsy. pulmonary edema and slight kidney damage were seen in these animals (Draize J. et al. 1948, in ACGIH 1986, p. 211). Cats exposed to dimethylphthalate vapors exhibited signs of intense irritation of the mucous membranes. excessive salivation, and restlessness at a concentration of 250 ppm; exposure to a concentration of 1250 ppm caused the death of one cat and signs of nervous system depression in the surviving animals (LeFaux 1968, p. 136, in ACGIH 1986, p. 211). A chronic feeding study in female rats involving doses of 2 to 8 percent dimethylphthalate in the diet showed growth effects in animals dosed at the 4 and 8 percent levels and nephritic changes in those dosed at the 8 percent level (Clayton and Clayton 1982, p. 2343). Pregnant rats given intraperitoneal injections of dimethylphthalate at various doses on days 5 through 15 or 3 through 9 of gestation had litters with an increased number of skeletal abnormalities or experienced an increase in the number of resorptions (RTECS 1991; Singh, Lawrence, Autian 1972, J. Pharmacol. Sci. 61:51-55; J. Dairy Sci 55, 1972).

In humans, dimethylphthalate is an irritant of the eyes and mucous membranes; this substance is not readily absorbed through the skin (Windholz M and Budavari S, 1976). Ingestion of dimethylphthalate causes gastrointestinal irritation, hypotension, and coma. In one fatal case of a suicidal ingestion of a mixture containing dimethylphthalate and ketone peroxides, the principal toxic symptoms were marked esophagitis and gastritis with hemorrhage (NIOSH/OSHA Guidelines 1981, p. 1). Direct contact of dimethylphthalate with the eyes has caused chemical burns that subsequently healed completely (McLaughlin RS, 1946, in Clayton and Clayton 1981, p. 2343).

Based on this evidence, OSHA preliminarily concludes that agricultural workers exposed to this substance at the levels permitted by the absence of a limit are at significant risk of experiencing irritation of the eyes and mucous membranes. The Agency considers these effects material health impairments and believes that establishing a PEL of 5 mg/m3 as an 8hour TWA is necessary to protect workers in agriculture from these significant risks. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

EPICHLOROHYDRIN
CAS: 106-89-; Chemical Formula:
CaH₅ClO
H.S. No. 1158

OSHA has an 8-hour TWA limit of 5 ppm, with a skin notation, for epichlorohydrin in the construction and maritime industries. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 2 ppm. with a skin notation, for epichlorohydrin. NIOSH considers this substance a potential human carcinogen and recommends that occupational exposure be minimized to the extent possible. OSHA is proposing a 2 ppm TWA, with a skin notation, for epichlorohydrin in the construction, agriculture, and maritime industries. This is the limit recently promulgated for this substance in the air contaminants standard for general industry

Epichlorohydrin is an unstable liquid with an odor like that of chloroform. It is used as a solvent, as the raw material for the manufacture of epoxy and phenoxy resins and of elastomers, in the synthesis of glycerol, and in the rubber and paper industries (ACGIH 1986, p. 233)

In animals, epichlorohydrin causes irritation and is systemically toxic by all routes of exposure (Shell Chemical Corporation 1958, as cited in ACGIH 1986/Ex. 1-3, p. 233). Chronic exposure causes nephrotoxicity (IARC 1987, Suppl. 7, p. 202). This substance also causes cancer and has reproductive effects in experimental animals. The oral LD50 in rats ranges from 90 mg/kg to 260 mg/kg, and the dermal LD50 in rabbits ranges from 515 mg/kg to 755 mg/kg (Lawrence, Malik, Turner, and Autian 1972/Ex. 1-1058; RTECS 1987]. Acutely poisoned animals show respiratory and nervous system effects before death. In mice, single 30-minute exposures to an 8300-ppm concentration of epichlorohydrin vapor caused muscular paralysis and death from respiratory failure; similar results have been reported in rats after dermal application of a 0.5-ml/kg dose and in mice after repeated oral administration of 0.1 mg/kg doses (Shell Chemical Corporation 195, as cited in ACGIH 1986/Ex. 1-3, p. 233). When exposed to an epichlorohydrin concentration of 32 ppm (7 hours/day, 5 days/week) for 91 days, rats failed to gain weight nor mally; at a concentration of 16 ppm they developed enlarged kidneys (ACGIH 1986/Ex. 1-3, p. 233). Gage (1959/Ex. 1-1052) confirmed these findings and demonstrated lung, liver, and kidney injury in rats exposed repeatedly for 8 hours to epichlorohydrin concentrations ranging from 17 to 120 ppm; no effects

were observed when the concentration was reduced to 9 ppm. Epichlorohydrin has been tested for carcinogenicity in rats by oral administration and inhalation and in mice by skin application and subcutaneous and intraperitoneal injection. The results of both bioassays in rats were positive (papillomas and carcinomas of the forestomach and nasal cavity. respectively). Results of the skin painting study in mice were negative: however, epichlorohydrin caused injection-site tumors when administered to mice subcutaneously and was active in a mouse-lung tumor bioassay by intraperitoneal injection (IARC 1987, Suppl. 7, p. 202). Based on this evidence, the International Agency for Research on Cancer has concluded that the evidence for the carcinogenicity of epichlorohydrin in animals is sufficient and has assigned this substance to Category 2A (IARC 1987, Suppl. 7, p. 202). Administration of 15 mg/kg/day to rats caused infertility within 7 days; cessation of exposure restored fertility in these animals (IARC 1976, Vol. 11, p. 135). In a recent experiment, fertility in male rats given 50 mg/kg/day for 21 days before mating was totally impaired; dose-dependent trends in all sperm-motion parameters were observed in this study (Toth, Zenick, and Smith 1989, in Silver Platter printout).

In humans, exposure to epichlorohydrin causes moderate-tosevere irritation of the eyes and respiratory tract, skin burns and sensitization, and central nervous system, blood, and kidney effects. Exposure to an epichlorohydrin concentration of 20 ppm for 1 hour caused burning of the eyes and nasal mucosa (NIOSH 1976c/Ex. 1-972). At a concentration of 40 ppm, irritation persisted for 48 hours after exposure (NIOSH 1976c/Ex. 1-972). A worker exposed to high (not further specified) concentrations of epichlorohydrin experienced eye and upper respiratory tract irritation, nausea, vomiting, headache, and difficult breathing; this individual continued to show signs of pulmonary and liver damage and of hypertension 2 years after the incident (NIOSH 1976c/Ex. 1–972). In contact with the skin, epichlorohydrin causes redness and itching, as well as burns that may have a delayed onset (NIOSH 1976c/Ex. 1-972). Six workers in the Netherlands developed skin sensitization reactions to this substance after repeated contact with it in the workplace (van Joost 1988, Contact Derm: 19). NIOSH (1976c/Ex. 1-972) reports that humans exposed to

concentrations of epichlorohydrin above 100 ppm for brief periods have subsequently developed lung edema and kidney damage. A group of epichlorohydrin-exposed workers showed blood and cytogenetic effects. including increased incidences in the percentage of lymphocytes with chromatid breaks, damaged blood cells. and abnormal cells (Picciano 1979, Mutat. Res. 66:169-173). A laboratory assistant severely overexposed to epichlorohydrin developed eye and lung irritation, followed by chronic asthmatic bronchitis. Serial biopsies of the liver in this worker established that a substantial amount of fatty infiltration had occurred (Schultz 1964, in Deutsche med. Wochenschrift 89:1342-1344). The results of epidemiological studies of epichlorohydrin-exposed workers have been inconclusive. One study showed a slight excess of lung cancer in two cohorts of U.S. workers (Enterline 1982, in Ann. N.Y. Acad. Sci. 381:344-349); another study in a European cohort yielded inconclusive results (Tassignon, Bos, Craigen, Jacquet, Kueng, Lanouziere-Simon, Pierre 1983, in Int. Arch. Occup. Environ. Hlth. 51:325-336). A recent mortality study in dye and resin workers (Delzell, Macaluso, Cole 1989, in JOM 31) has shown a slight excess of lung cancer, although the number of observed cases was small in

OSHA is proposing an hour TWA limit of 2 ppm, with a skin notation, for epichlorohydrin in the construction. agriculture, and maritime industries. These are the limits recently established for this substance in general industry. The skin notation is proposed because of this substance's capacity to penetrate the skin and cause systemic toxicity. The Agency preliminarily concludes that this limit and the skin notation will protect workers in these sectors from the significant risk of dermal. respiratory, liver, and kidney effects that are potentially associated with exposure to epichlorohydrin at elevated concentrations. OSHA considers these exposure-related effects material impairments of health.

ETHYL ACETATE CAS: 141-78-6; Chemical Formula: CH₃COOC₂H₅

H.S. No. 2075

In general industry, construction, and maritime, OSHA's current permissible exposure limit for ethyl acetate is 400 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*—TWA of 400 ppm for this substance; there is no NIOSH REL. OSHA is proposing to apply an 8-hour TWA PEL of 400 ppm to ethyl acetate in

agricultural workplaces. Promulgation of this limit will make the PEL for ethyl acetate consistent across industry sectors.

Ethyl acetate is a colorless liquid with a fruity odor. It is used as a solvent for varnishes, lacquers, and nitrocellulose; and in the manufacture of artificial silk and leather, perfumes, photographic film, and artificial fruit essences (ACGIH 1986, p. 239; Clayton and Clayton 1982, p. 2267).

Ethyl acetate is an irritant of the eyes. mucous membranes, and respiratory tract in both animals and humans; at high concentrations it causes central nervous system depression in laboratory animals (ACGIH 1986, p. 239; Proctor, Hughes, and Fischman 1988, p. 234). The oral LD50 in rats is 5620 mg/kg; the subcutaneous LD50 in cats is reported to be 3000 mg/kg (RTECS 1990). Cats exhibited irritation and labored breathing following an 8-hour exposure to a 9000-ppm concentration of ethyl acetate; deep narcosis resulted from exposure to 20,000 ppm for 45 minutes, and exposure of these animals to 43,000 ppm for about 15 minutes was fatal. Autopsy revealed pulmonary edema with hemorrhage and hyperemia of the respiratory tract (Proctor, Hughes, and Fischman 1988, p. 234). Rabbits exposed repeatedly to 4450 ppm showed secondary anemia with leukocytosis and hyperemia and, at autopsy, liver damage (Proctor, Hughes, and Fischman 1988, p. 234). A study by Smyth and Smyth (1928) stated that animals could survive 65 exposures lasting 4 hours each at a concentration of 2000 ppm without suffering any ill effects.

Exposure of unacclimated human subjects to a 200-ppm concentration of ethyl acetate resulted in complaints about its strong, objectionable odor, and irritation of the eyes, nose, and throat was experienced at a concentration of 400 ppm (ACGIH 1986, p. 239). However, no adverse effects were noted in workers exposed for several months to ethyl acetate concentrations ranging from 375 to 1500 ppm (Proctor, Hughes, and Fischman 1988, p. 234; ACGIH 1986, p. 239). Exposure to ethyl acetate may, in rare instances, cause skin sensitization and result in inflammation of the mucous membranes and eczematous eruptions (Proctor, Hughes, and Fischman 1988, p. 234). There is one report of a fatality that resulted when a tank painter inhaled very high concentrations (level unspecified) of ethyl acetate (ACGIH 1986, p. 239).

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant

risk of experiencing the eye, mucous membrane, and respiratory tract irritation potentially associated with exposure to ethyl acetate and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA of 400 ppm for ethyl acetate in agriculture is necessary to substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

ETHYL AMYL KETONE
CAS: 541-85-5; Chemical Formula:
CH₂CH₂COCH₂CH₃CHCH₂CH₅
H.S. No. 2080

In general industry, construction, and maritime, OSHA's permissible exposure limit for ethyl amyl ketone is 25 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 25 ppm for ethyl amyl ketone. NIOSH has no REL but concurs with the PEL being proposed. OSHA is proposing an 8-hour TWA PEL in agriculture of 25 ppm for ethyl amyl ketone. Promulgation of this limit will make the PEL for ethyl amyl ketone consistent across all OSHA-regulated sectors.

Ethyl amyl ketone, which is also called 5-methyl-3-heptanone, is a colorless liquid with a strong, pungent odor that is similar to that of apricots and peaches. Ethyl amyl ketone is used as a solvent for nitrocellulose and vinyl resins and in the manufacture of perfume (Hawley's 1987, p. 478; Clayton and Clayton 1982, p. 4767).

Ethyl amyl ketone is an irritant of the eyes, mucous membranes, and skin in humans and animals. At very high concentrations, it also causes central nervous system depression (Proctor, Hughes, and Fischman 1988, p. 237; Clayton and Clayton 1982, p. 4767). The oral LDsos for rats, mice, and guinea pigs are 3500 mg/kg, 300 mg/kg, and 2500 mg/kg, respectively (RTECS 1991). In contact with the skin of rabbits, a 500mg dose of ethyl amyl ketone caused mild irritation (RTECS 1991). The lowest lethal concentrations in rats and mice are 3484 ppm over 8 hours and 3484 ppm over 4 hours, respectively (RTECS 1988). Mice and rats rapidly developed signs of eye and respiratory tract irritation when exposed to a single dose of vaporsaturated air (an ethyl amyl ketone concentration of approximately 3000 ppm) for 4 hours. Three of six mice died from this exposure, but there were no deaths among the rats (Clayton and Clayton 1982, p. 4768). Four of the six rats died after exposure to a 6000-ppm

concentration of ethyl amyl ketone for 8

hours (Clayton and Clayton 1982, p. 476).

Other signs of overexposure, including ataxia, prostration, and respiratory distress, were observed in these animals and were followed by narcosis (Clayton and Clayton 1982, p. 4768; Proctor, Hughes, and Fischman 1988, p. 237).

In humans, eye contact with ethyl amyl ketone causes transient corneal injury, and repeated contact with the skin results in drying and cracking (Proctor, Hughes, and Fischman 1988, p. 237). Individuals exposed to a 25-ppm concentration of ethyl amyl ketone developed irritation of the eyes and respiratory tract; exposure to 100 ppm caused symptoms of mucous membrane irritation, headache, and nausea that were too severe to be tolerated for more than a few minutes (Krasavage 1982, in Proctor, Hughes and Fischman 1988, p. 237).

Based on this evidence, OSHA preliminarily concludes that ethyl amyl ketone causes irritation of the eyes and mucous membranes, dermatitis, and narcosis in exposed workers. OSHA therefore preliminarily finds that, in the absence of a limit for ethyl amyl ketone, workers in agriculture are at significant risk of experiencing these material impairments of health and that the proposed 8-hour TWA PEL of 25 ppm is necessary to substantially reduce these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

ETHYL BENZENE

CAS: 100-41-4; Chemical Formula C₈H₁₀ H.S. No. 1162

OSHA's limit for ethyl benzene in the construction and maritime industries is 100 ppm as an 8-hour TWA. The Agency has no PEL in agriculture for this substance. The ACGIH has a TLV®-TWA of 100 ppm and a TLV*-STEL of 125 ppm for ethyl benzene; there is no NIOSH REL. Based on the irritant properties associated with exposure to ethyl benzene, OSHA is proposing permissible exposure limits for this substance in the construction, agriculture, and maritime industries of 100 ppm as an 8-hour TWA and 125 ppm as a 15-minute STEL. The Agency recently established these limits for ethyl benzene in general industry, and NIOSH (Ex. 8-47) concurred that these limits were appropriate for this substance.

Ethyl benzene is a colorless, flammable liquid with an aromatic odor. It is used as an intermediate in synthetic rubber and styrene production and as a solvent (ACGIH 1986, p. 244). This substance also finds use as a component of fuel (HSDB 1985).

Ethyl benzene is an irritant of the eyes, skin, and mucous membranes in both animals and humans; at high concentrations, this substance causes central nervous system depression (Proctor, Hughes, and Fischman 1988, p. 237). The oral LD50 in rats is 3500 mg/kg, and the dermal LD50 in rabbits is reported to range from 5000 to 17,800 mg/kg (Clayton and Clayton 1982, p. 3308; RTECS 1991). The lowest lethal concentration in rats is 4000 ppm for 4 hours (RTECS 1991).

A comment submitted by the Arco Chemical Company in OSHA's recent air contaminants rulemaking for general industry summarizes the available information on ethyl benzene's toxicity in animals, as reported in several recent studies (ECETOC 1986; Dynamac Corporation 1986) and in a personal communication from the National Toxicology Program's Chemical Manager for Ethyl Benzene. (Arco's comment summarizing these findings is in the docket as Ex. 3-638.) These investigators found that ethyl benzene causes: (1) Moderate dermal irritation on intact and abraded rabbit skin after a 24-hour application; (2) mild conjunctival irritation (without corneal effects) from direct instillation of undiluted ethyl benzene in rabbit eyes; (3) erythema and edema with superficial necrosis, resulting in exfoliation of large patches of skin, following repeated and prolonged application of the undiluted material to rabbit skin; (4) "a slight, cloudy swelling of hepatocytes" in animals subchronically exposed to the vapor; (5) congestion of the lungs, nasal mucosa, liver, and kidneys in mice and rats exposed 6 hours/day for 4 consecutive days to ethyl benzene concentrations of 2360 ppm and in mice exposed to 1190 ppm; and (8) lacrimation and salivation in rats exposed to 400 or 800 ppm concentrations of ethyl benzene for 6 hours/day, 5 days/week (ECETOC 1988 and Dynamac Corporation 1986, both as cited in Ex. 3-638). Arco (Ex. 3-638) stressed the fact that, except at very high concentrations, significant systemic toxicity does not appear to be a manifestation of ethyl benzene exposure.

Brief exposures of human subjects to a 5000-ppm concentration of ethyl benzene caused intolerable irritation, and exposure to 2000 ppm resulted in lacrimation, nasal irritation, and vertigo; exposure to a 1000-ppm concentration produced eye irritation, although volunteers rapidly developed a tolerance to this concentration. Acute exposure to the vapor at a concentration of 200 ppm causes mild eye irritation

(Wolf et al. AMA Arch. Ind. Hlth. 14:387, 1956). Chronic exposure to ethyl benzene concentrations above 100 ppm has caused fatigue, sleepiness, headache, and eye and respiratory tract irritation (Bardodej and Bardodegova 1970). Redness and inflammation may occur on contact of the skin with this substance (HSDB 1985).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers in construction, maritime, and agriculture who are exposed to concentrations of ethyl benzene above 100 ppm, even briefly, are at significant risk of experiencing eye and upper respiratory tract irritation. The Agency believes that the proposed limits are necessary to substantially reduce this risk of material health impairment. Accordingly, OSHA is proposing in construction, maritime, and agriculture a 15-minute short-term limit of 125 ppm for ethyl benzene to supplement the proposed 100-ppm TWA limit for this substance in these sectors. Promulgation of the proposed STEL will make OSHA's PELs for ethyl benzene consistent across all industry sectors within OSHA's jurisdiction.

ETHYL BUTYL KETONE CAS: 106-35-4; Chemical Formula: C₇H₁₄O H.S. No. 2077

In general industry, construction, and maritime, OSHA's permissible exposure limit for ethyl butyl ketone is 50 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 50 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 50 ppm for ethyl butyl ketone. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

Ethyl butyl ketone is a colorless liquid with a strong, fruity odor. It is used primarily as an organic solvent and a chemical intermediate but also finds use as a synthetic flavoring agent (Clayton and Clayton 1982, p. 4761; HSDB 1984).

Ethyl butyl ketone is an irritant of the eyes, mucous membranes, and skin in laboratory animals; at high concentrations, it causes central nervous system depression. The oral LDso in rats is 2760 mg/kg; the dermal LDso for rabbits is greater than 16.4 g/kg (20 ml/kg) (RTECS 1990; ACGIH 1986, p. 246). Rats exposed to a 4000-ppm concentration for 4 hours died, but all rats survived an exposure to 2000 ppm for 4 hours (ACGIH 1986, p. 246). A 68-hour exposure to a 5800-ppm ethyl butyl ketone concentration killed all rats, but exposure to 420 or 3000 ppm for the same period of time was not lethal;

however, ataxia, prostration, and narcosis were noted in these animals at the higher exposures (Clayton and Clayton 1982, p. 4762). Rats administered 2 g/kg/day by gavage, 5 days/week for 14 weeks exhibited hindleg weakness and tail drag. Neuropathology revealed centralperipheral-distal axonopathy characterized by neurofilamentous hyperplasia and giant axonal swelling (O'Donoghue et al. 1984). No signs of systemic toxicity or neurotoxicity were observed in rats exposed to a 700-ppm concentration of ethyl butyl ketone for 72 hours/week for 24 weeks (Clayton and Clayton 1982, p. 4762; Proctor, Hughes, and Fischman 1988, p. 239). Ethyl butyl ketone causes mild-tomoderate irritation when applied to the skin of rabbits. Contact of ethyl butyl ketone with the eyes of rabbits caused slight ocular irritation (Clayton and Clayton 1982, p. 4761).

Information on the effects of human exposure to ethyl butyl ketone is limited. Applied to the skin of volunteers for 48 hours under an occluded patch, a 4-percent solution of ethyl butyl ketone failed to cause skin irritation or skin sensitization (Clayton and Clayton 1982,

Based on this evidence, OSHA preliminarily concludes that in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eve, mucous membrane, and skin irritation associated with exposure to ethyl butyl ketone and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA PEL of 50 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. ETHYL ETHER

CAS: 60-29-7; Chemical Formula: C₂H₅OC₂H₅ H.S. No. 1164

OSHA's limit for ethyl ether in the construction and maritime industries is 400 ppm as an 8-hour TWA. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV®-TWA of 400 ppm and a TLV®-STEL of 500 ppm for ethyl ether; there is no NIOSH REL. OSHA is proposing a 400 ppm 8-hour TWA and a 500 ppm STEL for ethyl ether in the construction, agriculture, and maritime industries. These are the limits recently established in general industry, and their promulgation will make OSHA's PELs for this substance consistent across all OSHA-regulated sectors.

Ethyl ether is a colorless, volatile, mobile liquid with a distinct odor and a burning, sweet taste. It is extremely flammable and is a severe fire and explosion hazard when exposed to heat or flame. Ethyl ether is used as a reagent in organic synthesis and is also used as a solvent for waxes, fats, oils, perfumes, alkaloids, and gums (ACGIH 1986, p. 259). Ethyl ether also finds use as an anesthetic in human and animal medicine and as a refrigerant and motor fuel additive (ITI 1986, p. 178; NIOSH/OSHA Occupational Health Guideline 1981, p. 3).

Ethyl ether is an irritant of the eyes. skin, and respiratory tract in both animals and humans; exposure to high concentrations causes central nervous system depression and anesthesia. The oral LD50 in rats is 1215 mg/kg, and the LC60 in the same species is 73,000 ppm for 2 hours (RTECS 1991). The lethal concentration for a single exposure in the monkey is reportedly between 71,600 ppm and 192,500 ppm ethyl ether by volume (Clayton and Clayton 1982, pp. 2507-2510). Exposure to a 6.4 percent (64,000 ppm) concentration of ethyl ether caused deep anesthesia in mice, and respiratory arrest occurred at a concentration of 12.8 percent (128,000 ppm) (Clayton and Clayton 1981, p. 2507-2510). Contact of the eyes of rabbits with ethyl ether has produced slight, reversible injury (Grant 1986, p. 411). Chronic exposure of rats to a 2000ppm concentration of ethyl ether for more than 30 weeks caused no adverse effects on body weight, food consumption, hematology, urinalysis, or histopathology; however, liver enzymes were elevated in these animals despite the fact that no liver damage was identified at autopsy by microscopic examination (Clayton and Clayton 1982, pp. 2507-2510). Mice exposed to ethyl ether during pregnancy have had an increased number of offspring with abnormalities (RTECS 1991; Friedman 1988). Ethyl ether is mutagenic both in bacterial and mammalian test systems (RTECS 1991).

Concentrations of 3.6 to 6.5 percent ethyl ether in air (36,000 to 65,000 ppm) cause anesthesia in humans; exposure to 7- to 10-percent concentrations (70,000 to 100,000 ppm) causes respiratory arrest, and exposure to concentrations greater than 10 percent (100,000 ppm) can be fatal (ACGIH 1986/Ex. 1-3, p. 259). Repeated workplace exposures to ethyl ether can cause narcosis, exhaustion, headache, dizziness, sleepiness, excitation, and other psychic disturbances (Hake and Rowe 1963a/Ex. 1-1152). Albuminuria and polycythemia may be caused by repeated exposure,

and nephritis has occasionally been reported (Clayton and Clayton 1981, p. 2507-2510). Prolonged or repeated contact may cause defatting of the skin; irritation of the mucous membranes and eyes occurs on contact with the liquid or after exposure to high concentrations of the vapor (Hake and Rowe 1963a/Ex. 1-1152). Nelson and co-workers (1943/Ex. 1-66) reported that workers began to experience nasal irritation at a concentration of 200 ppm (Nelson, Enge, Ross et al. 1943/Ex. 1-66). However, Armor (1950, as cited in ACGIH 1986/ Ex. 1-3, p. 259) observed that exposure effects occur in humans only at 500 ppm or higher concentrations of ethyl ether.

OSHA recently established in general industry the limits being proposed here for the construction, maritime, and agriculture industries. The Agency preliminarily concludes that both a TWA and a STEL are necessary to protect exposed workers in construction, maritime, and agriculture against the significant risk of irritation and narcosis potentially associated with excursions above the 8-hour TWA level. OSHA believes that the irritation and narcosis caused by excessive exposure to ethyl ether constitute material impairments of health and that the proposed limits are necessary to substantially reduce these risks.

ETHYL FORMATE
CAS: 109-94-4; Chemical Formula:
HCOOC₂H₅
H.S. No. 2079

In general industry, construction, and maritime, OSHA's permissible exposure limit for ethyl formate is 100 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*–TWA of 100 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 100 ppm for ethyl formate. Promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

Ethyl formate is a colorless, combustible liquid with a pleasant odor. It is used as a fungicide and larvicide for tobacco crops, dried fruits, cereals, and other crops. It is also used as a flavoring agent, a solvent, and in organic synthesis (ACGIH 1986, p. 260; Clayton and Clayton 1982, p. 2263). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Ethyl formate is an irritant of the eyes, skin, and upper respiratory tract; at high concentrations, it causes central nervous system depression in laboratory animals. The oral LD₅₀ in rats is 1850

mg/kg, and the dermal LD50 in rabbits is 20 g/kg (RTECS 1990; HSDB 1985). Exposure to an 8000-ppm concentration of ethyl formate for 4 hours killed 5 of 6 rats, but exposure to a 4000-ppm concentration for 4 hours was not lethal (Flury and Zernik 1931, p. 375; Proctor, Hughes, and Fischman 1988, p. 254). Deep narcosis resulted when cats were exposed to a 10,000-ppm concentration for 80 minutes, and these animals subsequently died. Exposure to a 10,000ppm concentration for 4 hours caused pulmonary edema and death in dogs (Flury and Zernik 1931, p. 375; Fasset 1963, p. 1865; Proctor, Hughes, and Fischman 1988, p. 254). Cats exposed for 20 minutes to a 5000-ppm concentration exhibited signs of eye irritation. Applied to the skin of mice, ethyl formate did not cause tumors (Clayton and Clayton 1982, p. 2264; Flury and Zernik, 1931, p. 375; Proctor, Hughes, and Fischman 1988, p. 254).

Slight eye irritation and rapidly increasing nasal irritation were reported in humans exposed to a 330-ppm concentration of ethyl formate (Flury and Zernik 1931, p. 375; Proctor, Hughes, and Fischman 1988, p. 254), but no systemic effects have been reported.

Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye, skin, and respiratory tract irritation associated with exposure to ethyl formate and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA PEL of 100 ppm for this substance will substantially reduce this risk for workers in this sector. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

ETHYL MERCAPTAN
CAS: 75–08–1; Chemical Formula:
C2H₅SH
H.S. No. 1165

OSHA has an 8-hour TWA PEL of 0.5 ppm for ethyl mercaptan in general industry and in the construction and maritime industries. The Agency has no PEL for ethyl mercaptan in agriculture. The ACGIH has a TLV*-TWA of 0.5 ppm for this substance, and the NIOSH REL is 0.5 ppm as a 15-minute ceiling. OSHA is proposing an 8-hour TWA limit of 0.5 ppm for ethyl mercaptan in the agriculture industry. Promulgation of this limit will make the PEL for ethyl mercaptan consistent across all OSHA-regulated sectors.

Ethyl mercaptan is a colorless liquid with a very strong, unpleasant odor. It is

used in the manufacture of insecticides, defoliants, pharmaceuticals, adhesives, antioxidants, and plastics and as an odorant for natural gas (ACGIH 1986, p. 262; HSDB 1985). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Ethyl mercaptan is an irritant of the mucous membranes; at high concentrations, it causes central nervous system depression in both animals and humans. The oral LD50 in rats is 682 mg/kg, and the LCso in the same species is 4420 ppm for 4 hours (RTECS 1989). Acutely poisoned animals showed behavioral and pulmonary effects before death (RTECS 1989). Maximal sublethal intraperitoneal doses have been reported to induce deep sedation, with higher exposures causing restlessness, muscular incoordination. skeletal muscle paralysis, cyanosis, respiratory depression, coma, and death. Although inhalation exposure caused no noticeable pathology in rats, intraperitoneal injection caused lymphatic infiltration of the liver, with occasional necrosis (Fairchild and Stokinger 1958, Ex. 1-415). One drop applied to rabbit eyes caused only slight irritation, but 15 minutes of exposure to high concentrations of the vapor caused closing and rubbing of the eyes, both indications that the animals were experiencing considerable irritation (Fairchild and Stokinger 1958/Ex. 1-415). In chronic inhalation studies in rabbits, rats, and mice, a five-month exposure to a 40-ppm concentration caused minimal cardiovascular and other systemic effects (Blinova 1965/Ex. 1-603).

Human volunteers exposed to a 4-ppm concentration of ethyl mercaptan for three hours daily for 5 to 10 days reported the following adverse effects: altered taste and olfactory reations, periodic nausea, mucous membrane irritation, and fatigue. Exposure of volunteers to a 0.4-ppm concentration of this substance produced no adverse signs or symptoms (ACGIH 1986/Ex. 1–3, p. 262).

Based on this evidence in humans and animals, OSHA preliminarily concludes that the limit recently established in general industry and currently in effect in all OSHA-regulated sectors other than agriculture is necessary to protect workers in the agricultural sector.

OSHA considers the exposure-related effects of nausea, fatigue, and irritation to be material impairments of health.

The Agency preliminarily concludes that the proposed 8-hour TWA limit of 0.5 ppm is necessary to substantially reduce

these significant risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. ETHYLAMINE

CAS: 75-04-7; Chemical Formula: C2H5NH2

H.S. No. 2081

In general industry, construction, and maritime, OSHA's permissible exposure limit for ethylamine is 10 ppm as an 8hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 10 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 10 ppm for ethylamine. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

Ethylamine is a colorless liquid or gas, depending on the ambient temperature (boiling point: 16.6°C). It has a strong, unpleasant odor similar to that of ammonia (ACGIH 1986, p. 243; Genium MSDS 1985, No. 540). Ethylamine is used as a chemical intermediate for triazine herbicides (such as atrazine), a corrosion inhibitor, in resin chemistry, in organic chemistry, and as a stabilizer for rubber latex (HSDB 1986; ACGIH 1986,

p. 243).

Ethylamine is an irritant of the eyes, mucous membranes, and skin; in laboratory animals, it has also been shown to cause systemic toxic effects. The oral LDso in rats is 400 mg/kg (RTECS 1990; Clayton and Clayton 1981, p. 3145). The LCso in rats is 3000 ppm for 4 hours, and the dermal LDso in rabbits is 390 mg/kg (RTECS 1990). Two of six rats exposed to an 8000-ppm concentration of ethylamine for 4 hours died (Smyth et al. 1954, p. 61). Rabbits exposed repeatedly to a 100-ppm concentration developed corneal and pulmonary irritation, and damage to the liver and kidneys was seen at autopsy. Exposure to a 50-ppm concentration of ethylamine vapors for 2 weeks caused corneal injury in rabbits, and myocardial degeneration was seen at post-mortem (Brieger and Hodes 1951, p. 287). One drop of a 70 percent solution of ethylamine instilled into rabbit eyes caused damage rated as severe (Grant 1986, p. 413). Direct contact of the skin of guinea pigs with a 70-percent aqueous solution caused necrosis and deep scarring (ACGIH 1986, p. 243).

Exposure to ethylamine causes eye, skin, and upper respiratory tract irritation in humans. Workers have reported experiencing temporary blue, hazy vision after exposure to ethylamine; this effect is believed to be related to corneal edema (Grant 1986, p. 413). Conjunctivitis and tearing also are associated with exposure to the vapors of ethylamine (Clayton and Clayton 1982, p. 3149). Inhalation causes respiratory irritation, coughing, and difficulty in breathing. Direct contact of the eyes or skin with the liquid may cause permanent eye damage and skin burns. Systemic poisoning may occur and be manifested as headache, nausea. faintness, and anxiety (Clayton and Clayton 1982, p. 3149).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye, skin, and mucous membrane irritation associated with exposure to ethylamine. The Agency believes that establishing an 8-hour TWA PEL of 10 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

ETHYLENE GLYCOL CAS: 107-21-1; Chemical Formula: CH₂OHCH₂OH H.S. No. 1169

OSHA has no limit for ethylene glycol in the construction, agriculture, or maritime industries; however, the proposed limit of 50 ppm, as a ceiling, was recently established for this substance in general industry. The ACGIH has a TLV® of 50 ppm for ethylene glycol, as a ceiling limit; there is no NIOSH REL for this substance. The Agency is proposing a ceiling limit of 50 ppm for ethylene glycol in the construction, agriculture, and maritime industries. Promulgation of this limit will make the PEL for ethylene glycol consistent across all OSHA-regulated industries.

Ethylene glycol is used in antifreeze and coolant mixtures for cars and other vehicles; it is also an ingredient of hydraulic fluids and heat exchangers and a chemical intermediate (Clayton and Clayton 1982, p. 3818). Ethylene glycol is a colorless, viscous liquid that has no odor (Clayton and Clayton 1982,

p. 3818).

Ethylene glycol causes eye irritation, central nervous system depression, and kidney and liver damage in animals. The oral LD508 for various species range from 4700 mg/kg in rats to 7500 mg/kg in mice; the dermal LD50 in rabbits is 9530 mg/kg (RTECS 1990). Rats and rabbits exposed to an ethylene glycol concentration of 12 mg/m3 (approximately 5 ppm) 24 hours/day for 90 days showed signs of moderate to severe eye irritation and corneal damage (Coon, Jones, Jenkins, and Siegel 1970/Ex. 1-84). Another study

involving 30-day or 16-week exposures to concentrations as high as 350 to 400 mg/m3 (70 to 0 ppm), however, has shown no adverse effects in rats, guinea pigs, rabbits, dogs, and monkeys (Wiley, Hueper, and von Oettingen 1936, in ACGIH 1986, p. 253). Applied to the eyes of rabbits, ethylene glycol caused pain and reversible conjunctival injury but no corneal damage (Grant 1986, p. 417). In contact with the skin, ethylene glycol caused mild irritation in rabbits (RTECS 1990). Ingestion of ethylene glycol caused depression, ataxia, vomiting, seizures, and coma in cats and dogs; at autopsy, calcium oxalate crystals were found in the renal tubules and blood vessels of the brain (HSDB 1987). Rats fed diets containing 1 or 2 percent ethylene glycol for 2 years had shortened life spans, calcium oxalate stones in the bladder, severe kidney damage, and degeneration of the liver (Clayton and Clayton 1982, p. 3820). Recent studies in rats and mice have shown that inhalation or oral administration of ethylene glycol during pregnancy causes developmental abnormalities and fetotoxic effects (RTECS 1990; NIEHS 1988; Bushy Run Center 1988).

In humans, exposure to ethylene glycol causes eye and upper respiratory tract irritation. Ingestion of ethylene glycol causes narcosis, severe kidney and liver damage, and pulmonary edema (Proctor, Hughes, and Fischman 1988, p. 246). The lowest oral dose reported to be lethal in humans is 786 mg/kg (RTECS 1990). Exposure to an aerosol of ethylene glycol at a concentration of 12 ppm for 20 to 22 hours/day for 4 weeks caused headaches and throat irritation in human volunteers (Wills et al. 1974/ Ex. 1-582). When the concentration was increased to 80 ppm, the irritation was intolerable (Wills et al. 1974/Ex. 1-582). Rowe (1963/Ex. 1-865) concluded that daily exposure to a 100-ppm concentration of the vapor did not cause systemic or eye injuries, although Troisi (1949/Ex. 1-598) described nystagmus in overexposed workers (concentrations not reported). In the prior air contaminants rulemaking, one commenter (Ex. 3-830) was of the opinion that the 50-ppm ceiling limit should apply only to those workplaces where ethylene glycol is used at elevated temperatures. In response to this commenter, OSHA reiterated the Agency's long-standing policy, which is to base its permissible exposure limits on scientific evidence that exposure to a substance at a given concentration or dose is associated with a health risk and that promulgating a PEL will reduce that risk. Thus, a relationship between

exposure level and degree of risk is established and is deemed applicable in all workplaces and situations where the substance is present. If the characteristics of a process are such that employee exposure to a substance is nonexistent or is well below the levels associated with a health risk, the promulgation of a limit on employee exposure will have little or no effect on the operation or process and will therefore impose no additional burden on the employer. Therefore, in the specific case of ethylene glycol, OSHA saw no reason to limit application of the * rats; at autopsy, liver lesions, testicular 50-ppm ceiling limit to those processes where exposure to airborne ethylene glycol is most likely. Accordingly, the air contaminants rule for general industry established a 50-ppm ceiling limit for ethylene glycol that is in effect in all general industry workplaces.

Based on the toxicity evidence described above in humans and animals. OSHA is proposing a ceiling limit of 50 ppm for ethylene glycol in the construction, agriculture, and maritime industries; this concentration is just below the level at which clinical signs and symptoms have been noted in humans. OSHA considers these signs and symptoms, which include throat and respiratory irritation and headache, to be material impairments of health. The Agency preliminarily concludes that this limit is necessary to substantially reduce these significant risks for workers in the construction, maritime, and agriculture industries. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. ETHYLIDENE NORBORNENE CAS: 16219-75-3; Chemical Formula:

C9H12 H.S. No. 1171

OSHA has no limit for ethylidene norbornene in the construction, agriculture, and maritime industries. The ACGIH has a TLV® of 5 ppm as a ceiling limit; NIOSH has no REL for this substance but concurs (Ex. 8-47) with the limit being proposed. The Agency is proposing a 5-ppm ceiling limit for ethylidene norbornene in the construction, agriculture, and maritime industries; this is the limit for ethylidene norbornene recently established in general industry.

Ethylidene norbornene is a colorless liquid with a turpentine-like odor. It is used in the manufacture of pesticides and pharmaceuticals (ACGIH 1986, p. 261; HSDB 1987; Hazardous Substance Fact Sheet 1985, p. 1).

Ethylidene norbornene is an irritant of the eyes and nose in humans and causes systemic injury in laboratory animals.

The oral LDso in rats is 2527 mg/kg, the 48-hour LC50 in the same species is 1246 ppm, and the dermal LD50 in rabbits is 8189 mg/kg (RTECS 1989). Applied to the skin of rabbits, ethylidene caused a mild degree of irritation (RTECS 1989). In a range-finding study, five of six rats died following a 4-hour exposure to a 4000-ppm concentration of ethylidene norbornene (Smyth, Carpenter, Weil et al. 1969/Ex. 1-442). Exposure to a 237ppm concentration of ethylidene norbornene for 7/hours/day, 5 days/ week for 88 days was lethal to 21 of 24 atrophy, and hydrothorax were seen (Kinkead, Pozzani, Geary, and Carpenter 1971/Ex. 1-606). No deaths occurred in rats repeatedly exposed to a concentration of 90 ppm, but renal lesions and enlarged livers were observed in these animals at autopsy (Kinkead, Pozzani, Geary, and Carpenter 1971/Ex. 1-606). Beagle dogs exposed on the same regimen to a 93ppm concentration of ethylidene norbornene for 89 days survived but showed such post-mortem effects as testicular atrophy, hepatic lesions, and slight blood changes; less pronounced effects were seen after dogs were exposed to a 61-ppm concentration, and no effects were seen at 22 ppm (Kinkead, Pozzani, Geary, and Carpenter 1971/Ex. 1-606).

Human volunteers exposed to ethylidene norbornene concentrations of 11 ppm for 30 minutes experienced eye and nose irritation; even at a concentration of 6 ppm, transient eye irritation occurred (ACGIH 1986/Ex. 1-3,

Based on this evidence in humans and animals, OSHA is proposing a 5-ppm ceiling limit for this substance in the construction, agriculture, and maritime industries. The Agency preliminarily concludes that this limit is necessary to minimize the risk of material health impairment in the form of irritation that has been documented to occur during occupational exposures to ethylidene norbornene concentrations as low as 6 ppm for 30 minutes. The Agency preliminarily concludes that the promulgation of this limit will reduce this risk substantially and will additionally make OSHA's PEL for this substance consistent across all OSHAregulated sectors.

FLUORINE

CAS: 7782-41-4; Chemical Formula: F H.S. No. 1179

OSHA's PEL for fluorine in general industry, construction, and maritime is 0.1 ppm as an 8-hour TWA; NIOSH has no REL for fluorine. There is no PEL in agriculture. The ACGIH TLV*-TWA is 1

ppm and TLV*-STEL is 2 ppm. OSHA is proposing an 8-hour TWA PEL of 0.1 ppm for fluorine in agriculture. Promulgation of this limit will make the PEL for fluorine consistent across all regulated sectors.

Fluorine is a pale yellow gas with a pungent irritating odor.

Fluorine is a severe caustic and irritant of the eyes, nose, upper respiratory tract, and skin in humans and animals. The LC50 in rats is 185 ppm for 1 hour; acutely poisoned animals showed signs of severe eye and nose irritation before death and, at autopsy, showed pulmonary congestion and hemorrhage (RTECS 1991; Ricca 1970). On sublethal exposure, mice showed liver and kidney damage at autopsy (Keplinger and Suissa 1968).

In contact with moisture, fluorine reacts to form ozone and hydrofluoric acid. Volunteers exposed to a 50 ppm concentration of fluorine found the exposure intolerable. Subjects could tolerate a brief exposure to 25 ppm, but subsequently developed sore throats and pain in the chest that lasted for 6 hours (AIHA 1956). Pulmonary edema may follow overexposure to fluorine (Parmeggiani 1983, pp. 891-894). A recent study (Nemeth and Zsogon 1989) reports that long-term occupational exposure to fluorine causes osteosclerosis, especially of the spine and pelvic bones, and calcification of the spinal ligaments.

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers in agriculture who are exposed to fluorine are at significant risk of severe irritation of the eyes, nose, and respiratory tract. The Agency considers these effects material impairments of health and believes that the proposed PEL of 0.1 ppm as an 8hour TWA is necessary to substantially reduce the risk of these effects. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

FORMIC ACID CAS: 64-18-6; Chemical Formula: HCOOH H.S. No. 2086

In general industry, construction, and maritime, OSHA's permissible exposure limit for formic acid is 5 ppm as an 8hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 5 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 200 ppm for formic acid. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

Formic acid is a colorless, fuming liquid with a pungent, penetrating odor. It is used as a fumigant, an animal feed additive, a food preservative, a flavor adjunct, and in the manufacture of several substances, including insecticides, refrigerants, solvents, lacquers, and decalcifiers. Formic acid also is used in the textile, paper, and leather industries (HSDB 1986; ACGIH 1986, p. 279). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Formic acid is irritating and corrosive to the skin, eyes, mucous membranes, and respiratory tract; it has caused narcosis in laboratory animals and methemoglobinemia in dogs. The oral LD508 in rats, dogs, and mice are 1100 mg/kg, 4000 mg/kg, and 700 mg/kg. respectively, and the intraperitoneal LD₅₀ for mice is 940 mg/kg (RTECS 1990; Clayton and Clayton 1982, p. 4906). Rabbits exposed intravenously to formic acid in doses ranging from 0.46 to 1.25 mg/kg suffered central nervous system depression, vasoconstriction, and diuresis. Increasing the dose to approximately 4 g/kg caused convulsions and death in rabbits, and dogs given this dose showed methemoglobinemia (Clayton and Clayton 1982, p. 4908). Administration of formic acid to monkeys has produced the same type of toxicity to the optic nerves as is seen in systemic methanol poisoning (Grant 1986, pp. 447-448). Instilled into the eyes of rabbits, formic acid caused severe burns (RTECS 1990). Reduction in body weight gain and organ size was seen in young rats that had been given 0.5 to 1.0 percent formic acid in their food or drinking water for 6 weeks. Rats given 360 mg/kg formic acid in their drinking water for 2 to 27 weeks had a reduced rate of body weight gain and a reduced food intake but did not show other adverse effects (Clayton and Clayton 1982, p. 4908).

In an industrial accident that resulted in a fatality, a worker splashed in the face with hot formic acid experienced marked dyspnea with dysphagia; death occurred 6 hours following exposure and was caused by pulmonary edema (Proctor, Hughes, and Fischman 1988, p. 262). Workers exposed to a mixture of formic and acetic acid at 15 ppm concentrations of each acid complained of nausea and considerable irritation (ACGIH 1986, p. 279; Clayton and Clayton 1982, p. 4908). Ingestion of formic acid causes salivation, vomiting, a burning sensation in the mouth and pharynx, and severe pain; circulatory collapse and death may follow (Clayton

and Clayton 1982, p. 4908). In contact with the skin, formic acid causes burns with vesiculation, and keloid formation is common (Proctor, Hughes, and Fischman 1988, p. 262).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing irritation and burning of the skin, eyes, mucous membranes, and respiratory tract associated with exposure to formic acid. The Agency believes that establishing an 8-hour TWA PEL of 5 ppm in agriculture is necessary to provide agriculture workers with the same degree of protection being afforded workers in the other sectors covered by OSHA. **FURFURAL** CAS: 98-01-1; Chemical Formula:

C6H4O2 H.S. No. 1183

OSHA's PEL for furfural in the construction and maritime industries is an -hour TWA limit of 5 ppm, with a skin notation. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 2 ppm, with a skin notation, for furfural; there is no NIOSH REL for this substance. OSHA is proposing a TWA PEL of 2 ppm, with a skin notation, for furfural in the construction, agriculture, and maritime industries; this is the limit recently established for this substance in general industry.

Furfural, also called furfuraldehyde, is a colorless, oily liquid that darkens to reddish-brown on exposure to light and air. Furfural is used as an extraction solvent in butadiene and lubricating oil production, as an intermediate in the production of furfuryl alcohol, and as a solvent for synthetic and natural resins (HSDB 1986). It is also used as a laboratory reagent, weed killer, fungicide, and as a flavoring agent in foods (HSDB 1986). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide

Act (FIFRA).

Furfural is a severe irritant of the eyes, mucous membranes, and respiratory tract; in contact with the skin, this substance may cause dermatitis, skin sensitization, and photosensitization (Proctor, Hughes, and Fischman 1988, p. 263). Furfural is also a carcinogen in experimental animals. The oral LD50 in rats is 65 mg/kg, the 48-hour LC50 in the same species is 153 ppm, and the lowest lethal dermal dose in rabbits is 620 mg/kg (RTECS 1991). Rats acutely poisoned by oral administration of

furfural showed weakness, ataxia, and coma before death (Proctor, Hughes, and Fischman 1988, p. 263). Exposure to a 260-ppm concentration of furfural was fatal to rats but not to mice or rabbits (AIHA 1978). Rabbits given subcutaneous injections of furfural developed hypochronic anemia, with leukopenia, and had deficits in liver and kidney function (Gosselin, Smith, and Hodge 1984, p. II-187). A 4-week exposure of dogs to a 130 ppm concentration of furfural for 6 hours/day caused fatty degeneration of the liver, but no adverse effects were observed when dogs were exposed to 63 ppm on the same regimen (AIHA 1978). A 2-year carcinogenicity bioassay showed that furfural is clearly carcinogenic in male mice and suggested that this substance is also carcinogenic in male rats and female mice (NTP 1990: Fifth Annual Report). Furfural also has induced mutations in the somatic cells of hamster ovaries (RTECS 1991).

Bugyi and Lepold (1949/Ex. 1-1077) described numbness of the tongue and oral mucosa, absence of a sense of taste, and labored breathing in workers exposed to furfural (at unspecified levels) in a poorly ventilated facility. Korenman and Resnik (1930, as cited in ACGIH 1986/Ex. 1-3, p. 280) reported that workers inhaling furfural concentrations of from 1.9 to 14 ppm developed headache, scratchy throat, and eye irritation; Kuhn (1944/Ex. 1-3) reported that exposure to furfural also damages the eyesight of some exposed individuals. NIOSH (1975e/Ex. 1-1183) described widespread eye and respiratory tract irritation among workers at a grinding wheel plant who were exposed to furfural vapors at concentrations ranging from 5 to 16 ppm. However, a study by Dunlop and Peters (1953/Ex. 1-1189) reports that 15 years of furfural use in the synthetic resin industry did not cause adverse health consequences in exposed workers if the facility was adequately ventilated; this study also showed that furfural occasionally causes sensitization reactions.

Based on this evidence in humans and animals, OSHA preliminarily concludes that the current 8-hour TWA limit of 5 ppm is not sufficient to protect workers in the construction, maritime, and agriculture industries from eye and respiratory tract irritation; this fact is clearly shown by the NIOSH study (1975e/Ex. 1-1183), in which widespread irritation was reported among workers exposed to furfural concentrations ranging from 5 to 16 ppm. Therefore, to protect workers in these sectors from experiencing eye and respiratory tract

irritation, OSHA is proposing a PEL for furfural of 2 ppm as an -hour TWA in the construction, agriculture, and maritime industries. OSHA is also retaining the skin notation in construction and maritime and proposing it in agriculture because furfural readily penetrates the skin to cause toxic effects. OSHA preliminarily concludes that the proposed limit is necessary to substantially reduce a significant risk of material health impairment in exposed workers. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

FURFURYL ALCOHOL
CAS: 98–00–0; Chemical Formula:
C₆H₆O₂

H.S. No. 1184

OSHA's limit for furfuryl alcohol in the construction and maritime industries is 50 ppm as an 8-hour TWA. The Agency has no PEL in agriculture for this aubstance. The ACGIH has a TLV*-TWA of 10 ppm and a TLV*-STEL of 15 ppm, with a skin notation, for furfuryl alcohol; the NIOSH REL is 50 ppm as a 108-hour TWA. OSHA is proposing a 10 ppm 8-hour TWA and a 15 ppm 15-minute STEL, with a skin notation, for this substance in the construction, agriculture and maritime industries. These are the limits recently established for furfuryl alcohol in general industry.

Furfuryl alcohol is a colorless liquid that turns red or brown on exposure to light and air. It is used as a wetting agent, as a solvent for dyes, gums, and resins, and as an ingredient in flavorings, foundry cores, polymers, sealants, and cements (ACGIH 1986, p. 281). Furfuryl alcohol is also a chemical intermediate and a liquid propellant for missiles (HSDB 1984).

Furfuryl alcohol causes irritation of the eyes and respiratory tract in both animals and humans; exposure to high concentrations also causes central nervous system depression. The oral LDso in rats is 88 mg/kg, the LCso in the same species is 233 ppm for 4 hours, and the dermal LD50 in rabbits is 400 mg/kg (RTECS 1991). Rats exposed to a 700ppm concentration of furfuryl alcohol showed signs of eye irritation and narcosis, and rats exposed daily to a concentration of approximately 19 ppm exhibited signs of moderate respiratory irritation (Comstock 1952). Contact of the liquid with the eyes of rabbits caused corneal injury, with opacity and reversible inflammation (NIOSH 1979). Experiments on laboratory animals indicated that percutaneous absorption of the liquid can cause toxic effects (NIOSH 1979).

Furfuryl alcohol exposure has been shown to cause sensory irritation in exposed workers. Apol (1973/Ex. 1-1180) reported that workers exposed to a 10.8-ppm concentration of furfuryl alcohol experienced no discomfort but that severe lacrimation occurred at a concentration of 15.8 ppm. Formaldehyde was also present at a concentration of 0.33 ppm. Burton and Rivera (1972/Ex. 1-944) found no irritation, headache, or dizziness among workers exposed to -hour TWA furfuryl alcohol concentrations of 5 and 6 ppm, with excursions up to 16 ppm. A recent study by Cockcroft et al. (1980, as cited in Ex. 150) reports that a 50-year-old moldmaker developed asthma after working with a mixture containing furfuryl alcohol, paraformaldehyde, xylene, and a catalyst containing sulfuric acid, phosphoric acid, and butyl alcohol. The patient's bronchial response to inhaled histamines was two to three times more severe following exposure to furfuryl alcohol mixed with butyl alcohol.

In the recent air contaminants rulemaking for general industry, one commenter (Ex. 3-349) stated that, in his opinion, the proposed 10 ppm and 15 ppm TWA/STEL limits for furfuryl alcohol were too low. This commenter believed that the irritation reported in the Apol et al. study was caused not by furfuryl alcohol but by formaldehyde. which was present at a concentration of 0.33 ppm. In response to this commenter, OSHA noted that severe irritation and lacrimation occur in most individuals only when the formaldehyde levels reach 3 ppm or above; at levels between 0.1 and 0.5 ppm, slight eye irritation may occur in some individuals (52 FR 46235). In the foundry study by Apol (1973/Ex. 1-1180), formaldehyde was present at a concentration of 0.33 ppm, about 10 times below the level associated with severe eye irritation. Therefore, OSHA concluded in the rulemaking that these workers' exposure to furfuryl alcohol at

1-1180).

Based on this evidence in humans and animals, OSHA preliminarily concludes that severe eye irritation is associated with exposure to concentrations of about 16 ppm furfuryl alcohol, and that furfuryl alcohol is capable of inducing more serious asthmatic responses in at least some workers. OSHA believes that the severe eye irritation and asthma caused by exposure to furfuryl alcohol are material impairments of health and functional capacity, and the Agency is accordingly proposing PELs for this substance in the construction, maritime,

a concentration of about 16 ppm was

lacrimation reported by Apol (1973/Ex.

most likely to be the cause of the

and agriculture industries of 10 ppm as an 8-hour TWA and 15 ppm as a 15-minute STEL, with a skin notation, to substantially reduce these significant risks among exposed employees. In addition, promulgation of these limits will make OSHA's PELs for this substance consistent across all regulated sectors.

GLUTARALDEHYDE CAS: 111-30-8; Chemical Formula: OCH(CH₂)₂CHO H.S. No. 1187

OSHA has no limit for glutaraldehyde in the construction, agriculture, and maritime industries. The ACGIH has a TLV* for this substance of 0.2 ppm as a ceiling; there is no NIOSH REL. The Agency is proposing a ceiling limit of 0.2 ppm for glutaraldehyde in the construction, agriculture, and maritime industries. This is the limit recently established for glutaraldehyde in general industry, and NIOSH (Ex. 8-47) concurred that this is an appropriate limit for this substance.

Glutaraldehyde is a colorless aqueous solution with a pungent odor. It is used as a disinfectant in cold sterilization of medical equipment, as an intermediate and fixative for tissues, to crosslink polyhydroxy materials and proteins, as an embalming fluid, and in the tanning industry (ACGIH 1986, p. 285; HSDB 1985). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Glutaraldehyde is strongly irritating to the nose, eyes, and skin and can cause allergic contact dermatitis, dermal sensitization, and asthma from occasional or incidental occupational exposure (Jordan, Dahl, and Albert 1972/Ex. 1-1056). The oral LD50 in rats is 134 mg/kg, the LC₅₀ in the same species is 5000 ppm for 4 hours, and the dermal LD50 in rabbits is 2560 mg/kg (RTECS 1991). Instilled into the eyes of rabbits, a 25 percent solution of glutaraldehyde caused severe injury (graded 9 on an ascending severity scale of 1 to 10) (Grant 1986, p. 462). In contact with the skin of rabbits, glutaraldehyde causes a moderate degree of irritation (Clayton and Clayton 1981, p. 2654). A dosedependent contact hypersensitivity response to glutaraldehyde has recently been demonstrated in guinea pigs and mice (Stern, Holsapple, McCay, and Munson 1989). Mice exposed to alkalinized glutaraldehyde at concentrations of 8 or 33 ppm for 24 hours have shown marked nervous behavior, with panting and compulsive washing of the face and limbs; those

exposed to 33 ppm exhibited signs of toxic hepatitis at autopsy (Varpela, Otterstrom, and Hackman 1971/Ex. 1–1072).

There is considerable evidence that occupational exposure to glutaraldehyde causes contact dermatitis, allergic skin sensitization, and respiratory sensitization. The groups primarily affected are health care workers and morticians. In a study of a coldsterilizing operation in which the operator was exposed for 12 minutes to an activated 2-percent aqueous solution of glutaraldehyde, a measurement of 0.38 ppm glutaraldehyde was taken in the operator's breathing zone; the operator and the investigators experienced severe eye, nose, and throat irritation as well as sudden headache at the end of the sterilization procedure (Schneider and Blejer 1973, as cited in ACGIH 1986/Ex. 1-3, p. 285). A series of recent studies (Wiggins, McCurdy, and Zeidenberg 1989; Fowler 1989; Burge 1989; Stern, Holsapple, and Munson 1989; Norback 1988; Nethercott and Holness 19; Nethercott, Holness, and Page 1988) has demonstrated that occupational exposure to glutaraldehyde causes chest tightness, headaches, eye and throat irritation, contact dermatitis. nausea, airway obstruction, and asthma; patch tests confirmed the allergenicity of glutaraldehyde in many of these cases.

Based on this human and animal evidence, OSHA preliminarily concludes that glutaraldehyde clearly presents a significant risk of irritation of the eyes, nose, and throat, respiratory symptoms, nausea, headache, skin sensitization, and asthma to exposed workers. OSHA considers these exposure-related effects to be material impairments of health. Accordingly, OSHA believes that the proposed 0.2ppm ceiling limit is necessary to reduce these significant risks among workers in construction, maritime, and agriculture. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

HEXACHLOROCYCLOPENTADIENE CAS: 77-47-4; Chemical Formula: C₆Cl₆ H.S. No. 1196

OSHA has no PEL for hexachlorocyclopentadiene in the construction, agriculture, and maritime industries. The ACGIH has a TLV*-TWA of 0.01 ppm for this substance; there is no NIOSH REL. The Agency is proposing a TWA PEL of 0.01 ppm for hexachlorocyclopentadiene in the construction, agriculture, and maritime industries. OSHA recently established this PEL for hexachlorocyclopentadiene in general industry, and NIOSH (Ex. 8-

47) concurred that this limit was appropriate for this substance.

Hexachlorocyclopentadiene is a yellow to amber-colored nonflammable liquid with a pungent odor. It is used primarily in the manufacture of chlorinated pesticides and flame retardants (ACGIH 1986, p. 300; HSDB 1985). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Hexachlorocyclopentadiene is an irritant of the eyes, skin, mucous membranes, and respiratory system; in laboratory animals, it has also been shown to cause systemic toxicity. The oral LDso in rats is 113 mg/kg, the LCso in the same species is 1600 ppb for 4 hours, and the dermal LD50 in rabbits is 430 mg/kg (RTECS 1991). Applied to the skin of monkeys, 10 mg of hexachlorocyclopentadiene caused severe irritation (RTECS 1991). Rabbits died after inhaling a 1.5-ppm concentration of hexachlorocyclopentadiene for 7 hours, rats died after five 78-hour exposures to a 1-ppm concentration, and guinea pigs died after two 78-hour exposures to 3.2 ppm; however, animals of all species survived 150 78-hour exposures to a hexachlorocyclopentadiene concentration of 0.15 ppm (Treon, Cleveland, and Cappel 1955/Ex. 1-497). Acutely poisoned animals showed tearing, labored breathing, and, at high concentrations, tremors (Treon, Cleveland, and Cappel 1955/Ex. 1-497). Treon and associates (1955/Ex. 1-497) noted degenerative changes in the brain,

heart, liver, adrenal glands, and kidneys,

and signs of pulmonary damage in these

concentration of 0.15 ppm. In animals

necrotizing bronchitis, and bronchiolitis

were observed (Treon, Cleveland, and

animals at autopsy, even in those

exposed to higher concentrations,

animals exposed to the lowest

pulmonary edema, hyperemia,

Cappel 1955/Ex. 1-497) In humans, there are few data concerning hexachlorocyclopentadiene's toxicity. Irritation is known to occur, but the intolerable odor and eye irritation associated with exposure to this substance have discouraged prolonged exposures (McGilvray 1971, as cited in ACGIH 1986/Ex. 1-3, p. 300). In a group of 145 sewage treatment plant workers exposed to hexachlorocyclopentadiene after a large amount of this substance was dumped into the sewage system, 59 percent reported experiencing eye irritation, 45 percent developed headaches, and 27 percent experienced throat irritation (Clayton and Clayton 1981, p. 3751). Clinical examination of

these workers 3 days after the incident revealed proteinuria and elevated serum lactic dehydrogenase levels; these effects were no longer present three weeks later (Clayton and Clayton 1981, p. 3751).

The TWA PEL of 0.01 ppm that OSHA is proposing for the construction. maritime, and agriculture industries for this severely toxic substance is about 10 times below the level associated with systemic damage and pulmonary irritation in experimental animals. This is the limit recently established for hexachlorocyclopentadiene in general industry. OSHA preliminarily concludes that employees in construction, maritime, and agriculture are at significant risk of experiencing intense eye and pulmonary irritation, headaches, and potential organ damage and that the proposed PEL is necessary to substantially reduce these risks.

HEXACHLOROETHANE
CAS: 67-72-1; Chemical Formula:
CCl₃CCl₃
H.S. No. 1197

OSHA's PEL for hexachloroethane in construction and maritime is a 1-ppm TWA, with a skin notation. The 197-19 ACGIH TLV*-TWA is 1 ppm. The NIOSH REL for this substance is the lowest feasible level, based on hexachloroethane's potential carcinogenicity. OSHA is proposing an 8-hour TWA PEL of 1 ppm for hexachloroethane in agriculture, with a skin notation. Promulgation of this limit will make OSHA's PEL for this substance consistent across all industry sectors.

Hexachloroethane is a nonflammable white solid. This substance finds limited use in veterinary medicine and as a pesticide and is also used to make pyrotechnics and smoke devices (ACGIH 1986, p. 301(87)). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Hexachloroethane is an eye and upper respiratory tract irritant. The oral LD₅₀ in rats is 4460 mg/kg (RTECS 1990). A study by Weeks, Angerhofer, Bishop, et al. (1979/Ex. 1–400) reported no adverse effects among several animal species exposed daily to 15- or 48-ppm concentrations of hexachloroethane for a period of 6 weeks. An NCI study (NCI 1978b/Ex. 1–949) reported that "extremely heavy dosages * * administered continuously for a long period of time" resulted in the development of hepatocellular tumors in mice but not in rats. In 1978, NIOSH

reviewed the results of the NCI (1978b/ Ex. 1-949) bloassay discussed above. Both male and female mice in this study exhibited an excess incidence of hepatocellular carcinoma, but rats did not. NCI concluded that early mortality may have obscured detection of a carcinogenic effect in rats [NCI 1978b/ Ex. 1-949). Kidney damage was also found in mice and rats treated with hexachloroethane. Based on this evidence, NIOSH (1978r) recommends that exposure to hexachloroethane be maintained at the lowest detectable level. The International Agency for Research on Cancer (IARC) concluded. after reviewing the available literature on this substance, that the evidence for the carcinogenicity of hexachloroethane in animals was limited (IARC 1979, Vol. 20, p. 473).

Little information is available on human responses to hexachloroethane exposure. Workers exposed to the fumes from heated chloroethane developed blepharospasm, photophobia, tearing of the eyes, and hyperemia; these effects cleared completely after the cessation of exposure (Grant 1986, p. 479). Exposure to high but unspecified concentrations of hexachloroethane dust are irritating (Torkelson and Rowe, in Clayton and

Clayton 1981) OSHA preliminarily concludes that exposure to hexachloroethane poses a significant risk of irritation and perhaps of kidney damage and cancer to workers in agriculture. OSHA therefore proposes an 8-hour TWA PEL of 1 ppm, with a skin notation, for this substance in agriculture. The Agency believes that this limit is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. sec-HEXYL ACETATE CAS: 108-84-9 H.S. No. 2090

In general industry, construction, and maritime, OSHA's permissible exposure limit for sec-hexyl acetate is 50 ppm as an 8-hour TWA. There is no limit for this substance in agriculture. The ACGIH has a TLV*-TWA of 50 ppm for sechexyl acetate; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL of 50 ppm for sec-hexyl acetate in agriculture. Promulgation of this limit will make the PEL for this substance consistent across all regulated sectors.

sec-Hexyl acetate is a colorless liquid with a mild, fruity odor. The principal use for this substance is as a solvent in the lacquer industry. It is also used as a fragrance in the cosmetic and perfume industry and as a component in housefly insecticides and beetle attractants

(HSDB 19; Clayton and Clayton 1982, p. 2278; Proctor, Hughes, and Fischman 1988, p. 272). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

sec-Hexyl acetate is an irritant of the eyes, mucous membranes, and upper respiratory tract in both animals and humans; at high concentrations, it causes narcosis in animals. The oral LD50 in rats is 6160 mg/kg; the dermal LD50 for rabbits is 20 gm/kg; and the lowest lethal concentration in rats is 2000 ppm for 4 hours (RTECS 1990), All rats exposed to an 8000-ppm concentration of sec-hexyl acetate died after a 48-hour exposure, while four out of six rats exposed to a 4000-ppm concentration for 4 hours survived (Smyth et al. 1954, pp. 61-68). Application of this substance to the skin of rabbits caused moderate irritation; instillation into the eyes of rabbits caused only minor corneal injury (Smyth et al. 1954, pp. 61-68; Carpenter, et al. 1974, pp. 313-319). Exposure to excessive concentrations of acetates causes eye, nose, and throat irritation and the gradual onset of narcosis in both animals and humans; recovery is slow after exposure is terminated (Clayton and Clayton 1982, p. 2268).

Human subjects experienced eye irritation on exposure to a 100-ppm concentration of sec-hexyl acetate for 15 minutes; concentrations higher than 100 ppm also caused nose and throat irritation (Silverman, et al. 1946, pp. 262–266). No chronic effects have been reported in humans (Proctor, Hughes, and Fischman 1988, p. 272).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye, nose, and throat irritation associated with exposure to sec-hexyl acetate and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA PEL of 50 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. HEXYLENE GLYCOL

CAS: 107-41-5; Chemical Formula: (CH₃)₂-COHCH₂-CHOH-CH₃ H.S. No. 1204

OSHA has no limit for hexylene glycol in the construction, agriculture, and maritime industries. The ACGIH has a TLV* of 25 ppm as a ceiling limit; there is no NIOSH REL. The Agency is proposing a ceiling PEL of 25 ppm for hexylene glycol in the construction, agriculture, and maritime industries. OSHA recently established this PEL in general industry, and NIOSH (Ex. 8-47) concurred that this limit was appropriate for hexylene glycol.

Hexylene glycol is a colorless liquid that has a mild, sweet odor. It is used as an intermediate, a selective solvent in petroleum refining operations, and as a component of inks, hydraulic fluids, cosmetics, and cements (ACGIH 196, p. 309; Sittig 1985, p. 501).

Hexylene glycol is an irritant of the eyes, skin, and upper respiratory tract; in laboratory animals, it has also been shown to cause central nervous system depression and systemic toxicity. In rats, the oral LDso is 3700 mg/kg; a dermal LD50 of 8560 mg/kg has been reported for rabbits (RTECS 1991). Undiluted hexylene glycol instilled into the rabbit eye caused irritation and corneal injury (Smyth and Carpenter 1948/Ex. 1-375). In contact with the skin for 24 hours, 500 mg caused moderate irritation in rabbits (RTECS 1991). Narcosis was produced in mice following a single oral dose of 2.0 ml/kg. and higher doses caused profound central nervous system depression (Smyth and Carpenter 1948/Ex. 1-375). Studies have shown that chronic feeding of this substance causes slight liver and kidney damage in experimental animals (Gosselin, Smith, and Hodge 1984, p. II-

At high concentrations, hexylene glycol vapors evoke a strong sensory response in humans: a 5-minute exposure to a 1000-ppm concentration produced eye irritation and throat and upper respiratory tract discomfort. At concentrations of 50 ppm for 15 minutes, most individuals experience slight eye irritation (ACGIH 1986/Ex. 1-3, p. 309). Subjects voluntarily ingesting 5 g hexylene glycol daily for 5 days failed to show adverse effects or urinary abnormalities (Gosselin, Hodge, and Smith 1984, p. II-179).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers exposed to this substance are at significant risk of experiencing exposure-related effects. The Agency believes that establishing a 25-ppm ceiling limit for hexylene glycol is necessary to substantially reduce these significant risks for workers in construction, maritime, and agriculture. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

HYDROGEN BROMIDE

CAS: 10035-10-6; Chemical Formula:

H.S. No. 1206

The OSHA PEL for hydrogen bromide in the construction and maritime industries is 3 ppm as an 8-hour TWA. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV* of 3 ppm as a ceiling; there is no NIOSH REL for hydrogen bromide. The Agency is proposing a 3-ppm ceiling limit for hydrogen bromide in the construction, agriculture, and maritime industries. OSHA recently established this PEL in general industry, and NIOSH (Ex. -47) concurred that this was the appropriate limit for hydrogen bromide.

Hydrogen bromide is a corrosive, colorless gas with an acrid odor. It is used in the manufacture of bromides, in organic synthesis, to dissolve certain ores, and as an alkylation catalyst (ACGIH 1986, p. 312). Hydrogen bromide also finds use as a laboratory reagent

(HSDB 1985).

Hydrogen bromide is a severe eye, nose, and respiratory tract irritant. In contact with moisture, hydrogen bromide forms hydrobromic acid.

Animal studies have demonstrated that hydrogen bromide has a considerably higher acute toxicity than hydrogen chloride (HCl) in mice and a somewhat higher acute toxicity than this chemical in rats (NIOSH 1977i/Ex. 1–1182). In mice, the LC₅₀ is 814 ppm for 60 minutes; in rats, the LC₅₀ is 2858 ppm for 60 minutes (RTECS 1991). In contact with the skin of rabbits, hydrobromic acid caused corrosive burns (HSDB 1985).

The chief toxic effect of hydrogen bromide in humans is severe primary irritation of the eyes, nose, throat, and lungs. Irritation begins within a few minutes on exposure to concen-trations of hydrogen bromide ranging from 3 to 6 ppm (Connecticut State Department of Health 1955, as cited in ACGIH 1986/Ex. 1-3, p. 312). In contact with the eyes, mucous membranes, or skin, hydrogen bromide solutions cause burns (Parmeggiani 1983, p. 327). Hydrogen bromide's mechanism of action is to form hydrobromic acid on contact with moisture; this acid then neutralizes the alkali of tissues and can cause death as a result of lung edema, larvngeal spasms, or upper respiratory tract inflammation (HSDB 1985). Skin contact in humans causes severe tissue irritation and necrosis (Braker and Mossman 1980, p. 373). Exposure to a 1300 to 2000-ppm concentration of hydrogen bromide is lethal within a few minutes (Braker and Mossman 190, p. 373). A laboratory assistant splashed with a mixture of bromine, phosphorus tribromide, and hydrogen bromide developed cough,

lightheadedness, throat congestion, shortness of breath, and bibasilar crackles within 2 weeks of the episode. The patient was hospitalized with bilateral lower-lobe chemical pneumonitis. The authors of this case report believe that this worker subsequently developed bronchiolitis obliterans because her symptoms later recurred (Kraut and Lilis 1988; Chest 94(1):208–210).

Based on this evidence, OSHA preliminarily finds that workers are at significant risk of experiencing severe irritant effects on brief exposure to hydrogen bromide. The Agency considers these irritant effects material impairments of health and believes that the proposed ceiling limit of 3 ppm is necessary to protect workers in the construction, agriculture, and maritime industries from these significant risks. Promulgation of this limit will make OSHA's PEL for hydrogen bromide consistent across all OSHA-regulated sectors.

HYDROGEN CHLORIDE CAS: 7647-01-0; Chemical Formula: HCl H.S. No. 2091

In general industry, construction, and maritime, OSHA has a PEL of 5 ppm as a ceiling limit for hydrogen chloride. The Agency currently has no PEL for this substance in agriculture. The ACGIH has a TLV* of 5 ppm (7.5 mg/m³) as a ceiling limit for hydrogen chloride; NIOSH has no REL. OSHA is proposing a PEL of 5 ppm as a ceiling limit for hydrogen chloride in agriculture; promulgation of this limit would mean that the PEL for hydrogen chloride in all OSHA-regulated industry sectors is the same.

Hydrogen chloride is a colorless, corrosive, nonflammable gas with a pungent, suffocating odor. Aqueous solutions of various concentrations are available commercially. Hydrogen chloride is used in the separation of cotton from wool; in the de-linting of cotton; as a catalyst for making oils viscous; in the activation of oil wells; in ore reduction, metal-pickling, and metal cleaning; in food processing; and in many other chemical processes (Braker and Mossman 1980, p. 378; ACGIH 1986, p. 313).

Hydrogen chloride is a strong irritant of the eyes, skin, mucous membranes, and respiratory tract; this substance also causes pulmonary sensitization. The LC50 in rats is 3141 ppm for 1 hour (RTECS 1990). The oral LD50 in rabbits is 900 mg/kg (RTECS 1990). Animals exposed to a hydrogen chloride concentration of 1350 ppm for 1.5 hours developed corneal clouding, and exposure to 300 ppm for 6 hours caused

slight erosion of the corneal epithelium (Patty 1949). Rabbits, guinea pigs, and pigeons exposed to a 100-ppm concentration for 6 hours/day for 50 days exhibited excitation and signs of eye and nose irritation (Jones 1972; Faigel 1964). Rats and mice exposed to hydrogen chloride for 6 hours/day, 5 days/week for 90 days at a 50-ppm concentration showed significant decreases in body weight, and rats exposed to 10, 20, or 50 ppm showed inflammation of the nasal passages (Chemical Industry Institute of Toxicology 1984).

In humans, exposure to high concentrations of hydrogen chloride causes necrosis of the tracheal and bronchial epithelium, pulmonary edema. atelectasis, emphysema, damage to the pulmonary blood vessels, and damage to the liver and other organs (Machle 1944). Male volunteers found concentrations of 50 to 100 ppm barely tolerable for 1 hour; exposure to 35 ppm for brief periods caused irritation of the throat, and 10 ppm was considered the maximal acceptable concentration for prolonged exposures (Henderson 1943). Exposure to concentrations of 5 ppm or above resulted in immediate irritation of the nose and throat, while exposure to concentrations below 5 ppm produced no adverse effects (Elkins 1959). Inhalation of high concentrations of hydrogen chloride for less than 1 hour induced cough and dyspnea among subjects with no past history of asthma or atopy; the same exposure caused severe bronchospasm that required mechanical ventilation in the case of an asthmatic subject. All subjects continued to show hyperresponsiveness more than 1 year later (Boulet 1988). Splashed into the eye and washed out immediately, hydrogen chloride causes white coagulation of the cornea and conjunctival epithelium; however, the damaged epithelium is later replaced by new epithelium, leaving the eye normal (Grant 1986, p. 489). Contact of the skin with the liquid causes skin burns, and repeated skin exposure to dilute solutions may cause dermatitis [M.C.A. 1970). Workers exposed chronically to hydrogen chloride experience gastritis and chronic bronchitis (Bransburg 1946). Chronic exposure to low concentrations has also led to erosion of the enamel of exposed teeth (NAS 1976; Ludewig

Based on this evidence in humans and animals, OSHA proposes to establish a PEL of 5 ppm as a ceiling for hydrogen chloride in agriculture; adoption of this limit would establish the same PEL for workplaces in all OSHA-regulated industry sectors. The Agency preliminarily concludes that occupational exposure to hydrogen chloride causes severe irritation of the eyes, skin, and upper respiratory tract. Accordingly, OSHA believes that, in the absence of a permissible exposure limit, workers in agriculture are potentially at significant risk for these exposure-related effects and that the proposed PEL is necessary to substantially reduce these risks.

HYDROGEN FLUORIDE CAS: 7664–39–3; Chemical Formula: HF H.S. No. 1208

The OSHA PEL for hydrogen fluoride in the construction and maritime industries is 3 ppm as an 8-hour TWA. The Agency has no limit for this substance in agriculture. The ACGIH has a TLV* of 3 ppm as a ceiling, and the NIOSH RELs for hydrogen fluoride are 3 ppm as a 108-hour TWA and 6 ppm as a 15-minute ceiling. The Agency is proposing a 3-ppm TWA PEL and a 6-ppm 15-minute STEL for hydrogen fluoride in the construction, agriculture, and maritime industries. These are the limits recently established for hydrogen fluoride in general industry, and NIOSH (Ex. 8-47) concurred with these limits in that rule-making.

Hydrogen fluoride is a fuming, colorless liquid; at temperatures above 19°C (66°F), it becomes a colorless gas. It is used as a catalyst in chemical synthesis, as a fluorinating agent, in fluorine and aluminum fluoride production, and in uranium refining operations (ACGIH 1986, p. 315). Hydrogen fluoride also finds use in dye chemistry, metal cleaning, crystal polishing, and iron enameling and galvanizing (HSDB 1985).

Hydrogen fluoride causes severe irritation and burns of the eyes, skin, mucous membranes, and respiratory tract; it can also be absorbed through the skin to cause systemic toxicity. Because fluorides accumulate in the bone, long-term exposure to hydrogen fluoride also can cause osteosclerosis (Rom 1983, p. 276). The LC50 in rats is 1276 ppm for 1 hour; in monkeys, the LCso is 1774 ppm for 1 hour (RTECS 1990). Application of a 2-percent solution of hydrogen fluoride to the skin of rabbits for 1 hour caused necrosis (AIHA 1988; Emergency Response Planning Guidelines). Guinea pigs and rabbits survived exposure to hydrogen fluoride concentrations of 40 ppm for a total of 41 hours, but exposure to a concentration of 300 ppm for two hours or more was fatal (Machle, Thamann, Kitzmiller, and Cholak 1934/Ex. 1-519). Animals exposed to a 3-ppm concentration of hydrogen fluoride for 30 days showed no adverse effects

(Ronzani 1909, as cited in ACGIH 1986/ Ex. 1-3, p. 315). Stokinger (1949a, as cited in ACGIH 1986/Ex. 1-3, p. 315) reported that animals repeatedly exposed to a 7-ppm concentration of hydrogen fluoride on a daily basis exhibited mild respiratory tract irritation. A study by Largent (1961/Ex. 1-1158) demonstrated kidney, liver, and lung damage in laboratory animals repeatedly exposed to a 17-ppm concentration of hydrogen fluoride. At a concentration of 8.6 ppm, however, the pathologic changes seen in exposed animals were minor, except for lung damage in one dog (Largent 1961/Ex. 1-1158). Guinea pigs, rabbits, and monkeys exposed to an 18.5-ppm concentration of hydrogen fluoride for 6 to 8 hours/day, 5 days/week for 2 months showed signs of liver and kidney damage at autopsy; a few animals showed signs of lung

damage as well (AIHA 1988). Hydrogen fluoride is a severe irritant of the eyes, mucous membranes, and lungs in humans. Based on the results of studies with volunteers and findings from accidental overexposures, it is believed that a 5-minute exposure to a 50- to 250-ppm concentration of hydrogen fluoride would be fatal (Proctor, Hughes, and Fischman 1988, p. 278). Largent (1960/Ex. 1-516: 1961/Ex. 1-115) reported that volunteers exposed repeatedly to concentrations of hydrogen fluoride as high as 4.7 ppm for 6 hours/day for 10 to 50 days experienced irritation and burning of the eyes and nose, in addition to reddening of the skin, at all hydrogen fluoride concentrations above 3 ppm. Industrial experience has shown that direct contact of the skin with hydrogen fluoride results in severe burns that may have a delayed onset but later develop into ulcers that eventually scar (Stokinger 1981b/Ex. 1-1127). A report by Eagers (1969, as cited in Stokinger 1981b, above) described several industrial accidents in which workers died in a matter of hours after containers of hydrogen fluoride ruptured and caused accidental splashing of nearby workers (the cause of death was respiratory failure and cardiac arrest). Kleinfeld (1965/Ex. 1-514) reported on a similar case of hydrogen fluoride poisoning that resulted in death from pulmonary edema. When splashed on the skin, hydrogen fluoride can be absorbed in quantities sufficient to cause hypocalcemia and hypomagnesemia, followed by lifethreatening cardiac arrhythmia (Proctor, Hughes, and Fischman 1988, p. 279). Chronic exposure to hydrogen fluoride can cause increased density of the bones, which is visible radiographically;

this condition may lead to crippling

osteosclerosis (Proctor, Hughes, and Fischman 1988, p. 279).

Based on this evidence in humans and animals, OSHA preliminarily finds that workers exposed to hydrogen fluoride are at significant risk of experiencing this substance's severe irritant and corrosive effects. The Agency believes that the effects caused by exposure to hydrogen fluoride constitute material impairments of health and that the proposed limits of 3 ppm as an 8-hour TWA and 6 ppm as a 15-minute STEL are necessary to substantially reduce these risks among workers in construction, maritime, and agriculture. These are the limits recently established for hydrogen fluoride in general industry

HYDROGEN PEROXIDE CAS: 7722-84-1; Chemical Formula: H₂O₂ H.S. No. 2092

In general industry, construction, and maritime, OSHA's permissible exposure limit for hydrogen peroxide is 1 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 1 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL of 1 ppm for hydrogen peroxide in agriculture. This is the limit recently established for this substance in general industry.

Pure anhydrous hydrogen peroxide is a colorless, odorless liquid. It is commercially available in 30%, 35%, 50%, 70%, and 90% grades. Hydrogen peroxide is used in water and sewage treatment, as a disinfectant, as an intermediate in chemical synthesis, as a fuel in rockets, and as a bleaching agent and deodorizer for textiles, hair, fur, wood pulp, and foods (AIHA 1978; HSDB 1986; ACGIH 1986, p. 316). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Hydrogen peroxide is an irritant of the eyes, mucous membranes, skin, and respiratory tract in both animals and humans. There is also limited evidence that hydrogen peroxide is carcinogenic in animals (IARC 1985, Vol. 35, p. 303). The oral LDso in mice is 2 g/kg, the dermal LD50 in rats is 4060 mg/kg, and the lowest lethal concentration in mice is 227 ppm (RTECS 1991). A 5-minute exposure of mice to approximately 3600 ppm of hydrogen peroxide resulted in pulmonary congestion and minor burns of the nose and jaws; a concentration of approximately 6500 ppm for the same period was lethal to these animals (AIHA 1978; Punte 1956). Sneezing. external body irritation, lacri-mation,

and bleaching of hair occurred in dogs exposed to a 7-ppm concentration of hydrogen peroxide (90-percent solution) for 6 hours/day for 6 months. Thickened skin and lung irritation were seen in these animals at autopsy, but no significant changes were noted in the blood or urine (Oberst et al. 1954). Applied to the eyes of rabbits, hydrogen peroxide causes irritation and corneal damage. The extent of eye damage depends on the concentration of hydrogen peroxide, with stronger concentrations causing greater damage (Grant 1986, p. 493). In oral bioassays, hydrogen peroxide induced adenomas and carcinomas of the duodenum in mice. The International Agency for Research on Cancer has concluded that the evidence for the carcinogenicity of hydrogen peroxide in animals is limited (IARC 1985, Vol. 35, p. 304).

Exposure to high concentrations of hydrogen peroxide vapor or mist causes severe irritation and inflammation of the nose and throat in humans (Proctor, Hughes, and Fischman 1988, p. 282). Dermal application of a 1- to 30-percent solution of hydrogen peroxide results in a characteristic whitening of the skin; if skin contact is prolonged, redness and blistering may occur (Hauschild et al. 1958; Proctor, Hughes, and Fischman 1988, p. 282). Application of a 1- to 3-percent solution of hydrogen peroxide to the eye causes severe pain and

reversible injury (Grant 1986, p. 493). Based on this evidence, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing eye, mucous membrane, skin, and respiratory tract irritation if exposed to hydrogen peroxide at the concentrations permitted by the absence of a limit. The Agency believes that establishing an 8-hour TWA PEL of 1 ppm is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. 2-HYDROXYPROPYL ACRYLATE CAS: 999-61-1; Chemical Formula:

CH2CHCOOCH2CHOHCH3 H.S. No. 1211

OSHA has no limit for 2-hydroxypropyl acrylate in the construction, agriculture, and maritime industries. The ACGIH has a TLV*-TWA of 0.5 ppm, with a skin notation, for 2-hydroxypropyl acrylate; there is no NIOSH REL for this substance. The Agency is proposing a TWA PEL of 0.5 ppm, with a skin notation, for this substance in the construction, agriculture, and maritime industries. This PEL was recently established for 2-

hydroxypropyl acrylate in general industry, and NIOSH (Ex. 8-47) concurred with this limit in that rulemaking.

2-Hydroxypropyl acrylate, also called HPA, is a colorless liquid that is used as a monomer for acrylic resins, a binder in nonwoven fabrics, and in the manufacture of thermosetting resins for surface coatings (Sittig 1985, p. 517;

ACGIH 1986, p. 320).

2-Hydroxypropyl acrylate causes irritation, severe burns and corrosion of the eyes and skin, and skin sensitization in animals and humans. In experimental animals, 2-hydroxypropyl acrylate has a high acute toxicity. The oral LD50 in rats is 250 mg/kg; the dermal LD50 in rabbits is approximately 0.25 mg/kg (RTECS 1990; Dow Chemical Company 1977, as cited in ACGIH 1986/Ex. 1-3, p. 320). In guinea pigs, direct contact with HPA caused severe eye burns and skin corrosion and sensitized some of the animals. Rats exposed to an HPA concentration of 650 ppm for 7 hours survived. Longer-term inhalation studies (2 hours/day, 6 days/week for 30 days) in rats, dogs, rabbits, and mice showed that the animals displayed signs of sensory irritation at concentrations of 2hydroxypropyl acrylate of 5 ppm and above (Dow Chemical Company 1977c, as cited in ACGIH 1986/Ex. 1-3, p. 320).

In humans, 2-hydroxypropyl acrylate has been shown to cause adverse skin effects. A recent study in individuals with allergic contact dermatitis reports that 3 of 24 exposed persons had become sensitized to HPA (Kanerva, Estlander, Jolanski 1988; Contact Dermatitis 18(1):1-5). Another study reports that a worker in an HPA manufacturing facility developed swelling, blisters, and an erythematous papular eruption on his foot, forearms, thighs, and groin after exposure to HPA. These lesions cleared after several days away from work but reappeared after the man returned to his job. This worker showed positive responses to patch testing with HPA and methacrylates; these results demonstrate that he had become sensitized to HPA and had developed a cross-sensitivity to methacrylates (Lovell, Rycroft, Williams, and Hamlin 1985; Contact Dermatitis 12(2):117-18).

Based on this evidence in humans and animals, OSHA preliminarily finds that the proposed limit is necessary to protect exposed workers in construction, maritime, and agriculture from the significant risks of irritation, skin and eye burns, and skin sensitization associated with exposure to 2-hydroxypropyl acrylate. The Agency considers these effects material impairments of health and preliminarily

finds that the proposed TWA limit of 0.5 ppm, with a skin notation, is necessary to substantially reduce these risks. Promulgation of this limit in construction, maritime, and agriculture will make OSHA's limit for 2-hydroxypropyl acrylate consistent across all OSHA-regulated sectors.

CAS: 7553-56-2; Chemical Formula: I H.S. No. 2095

In general industry, construction, and maritime, OSHA's current permissible exposure limit for iodine is 0.1 ppm as a ceiling limit. OSHA has no limit in agriculture. The ACGIH TLV® for iodine is 0.1 ppm as a ceiling limit; NIOSH has no REL. OSHA is proposing a ceiling PEL in agriculture of 0.1 ppm for iodine. This is the limit recently established for this substance in general industry.

Iodine is the heaviest of the halogens used in industry. Elemental iodine is a crystalline solid that occurs in blueblack or grayish-black plates or scales. It sublimes when heated to form a violet-colored vapor in air. Iodine is used as a bactericide, fungicide, amebicide, topical antiseptic and disinfectant, and to decontaminate drinking water. It is also used in antihyperthyroid drugs; in biological, biochemical, and chemical research; in dyes and soaps; and in engraving and lithography procedures (HSDB 1984; Clayton and Clayton 1982, p. 2972; ACGIH 1986, p. 323). When used in pesticidal applications and as directed on the label, this substance is regulated by the EPA under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA).

Iodine is irritating and corrosive to the skin, eyes, mucous membranes, and upper respiratory tract in both animals and humans. The oral LD50 in rats is 14 g/kg; the lowest lethal concentration in rats is 800 mg/m3 for 1 hour (RTECS 1991). Dogs exposed by intratracheal administration to iodine vapor at a dose of 36 mg/kg for 3 hours died; before death, signs of severe respiratory irritation were present, and autopsy revealed pulmonary edema and subpleural hemorrhage (Lockhardt, Koch, Schroeder, and Weiland 1920). Rats and guinea pigs exposed chronically to iodine vapors (concentration and duration not specified) showed reduced oxygen uptake and disrupted thyroid activity; at autopsy, the lungs of these animals were edematous and hemorrhagic (Begishev et al. 1976).

Industrial exposures to the vapor of iodine have shown this substance to be highly irritating at very low doses.

Exposure of four individuals to a concentration of 0.57 ppm for 5 minutes was without effect, but increasing this concentration to 1.63 ppm was irritating to the eyes within 2 minutes (AIHA 1965). Some workers experience moderate irritation at a concentration of 0.15 to 0.2 ppm and intolerable irritation at a 0.3-ppm concentration (ACGIH 1986, p. 323). The effects of overexposure to iodine include tearing, a feeling of tightness in the chest, sore throat, headache, and, if the overexposure is severe, respiratory symptoms equivalent to those associated with chlorine gassing (Lockhardt, Koch, Schroeder, and Weiland 1920). Chronic exposure to iodine leads to iodism, a condition characterized by tremor, insomnia, weight loss, conjunctivitis, bronchitis, tachycardia, and diarrhea (Seymour 1983; Peterson 1983).

Based on this evidence in humans and animals, OSHA preliminarily concludes that workers in agriculture are potentially exposed to a significant risk of eye, mucous membrane, and upper respiratory tract irritation and may also be at risk of developing iodism, a condition that can be life-threatening if untreated. OSHA believes that establishing a limit in agriculture for iodine at the proposed ceiling level of 0.1 ppm is necessary to protect agricultural workers from these risks. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors. IRON SALTS (SOLUBLE)

CAS: Varies with compound: Chemical

Formula: Varies with compound

H.S. No. 1217

OSHA has no limit for soluble iron salts in the construction, agriculture, and maritime industries. The ACGIH has a TLV*-TWA of 1 mg/m³ for these substances; there are no NIOSH RELs. The Agency is proposing a TWA PEL of 1 mg/m³ for the soluble iron salts in the construction, agriculture, and maritime industries. This PEL was recently established in general industry, and NIOSH (Ex. 8-47) concurred that this PEL was appropriate for the soluble salts of iron.

The soluble salts of iron include ferric chloride, ferric nitrate, ferric sulfate, ferrous chloride, and ferrous sulfate (ACGIH 1986, p. 328). Ferric salts are used as astringents in treating some skin disorders, and both the ferrous and ferric salts are used in the textile industry and the dye industry (ACGIH

1986, p. 328).

The soluble salts of iron are irritants of the skin and respiratory tract; in large doses, they are corrosive and

systemically toxic (ACGIH 1986, p. 328; Gosselin, Smith, and Hodge 1984, p. II-139). Iron salts are highly toxic by intravenous injection and moderately toxic by oral administration; their acute toxicity by inhalation has not been established. The oral LD50 in rats for ferric chloride is 172 mg/kg; for ferrous sulfate, the oral LDso in rats is 318 mg/kg (Sax and Lewis 1989, p. 2015). By intravenous administration, the LD10 for ferric chloride in rabbits is 7.2 mg/kg (ACGIH 1986, p. 328). Acutely poisoned animals show alkalosis, hypothermia, anorexia, oligodipsia, oliguria, diarrhea, and alternating irritability and depression before death. At autopsy, congestion of the gastrointestinal tract, liver, kidneys, heart, lungs, brain, spleen, adrenals, and thymus is seen (Clayton and Clayton 1981, p. 1665). Dogs administered 0.2 to 0.8 g of ferric chloride daily on a chronic regimen (duration not specified) failed to develop physiological changes (Clayton and Clayton 1982, p. 1667). When inhaled as dusts and mists, the iron salts are irritants of the respiratory tract (ACGIH 1986, p. 328). Stewart and Faulds (1934/ Ex. 1-764) identified the ferric salts as skin irritants.

Although the oral toxicity of the iron salts is considered moderate, marked gastrointestinal irritation results from the ingestion of these salts by humans (U.S. Department of Labor 1941, as cited in ACGIH 1986/Ex. 1-3, p. 328). The estimated fatal dose for humans by ingestion is 30 grams (Smyth 1956/Ex. 1-759). Humans poisoned by iron salts develop the following signs and symptoms: Vomiting, hematemesis, diarrhea, lethargy, coma, irritability, seizures, abdominal pain, and increased cardiac and respiratory rates (Clayton and Clayton 1981, p. 1665). Contact of the eye with ferric or ferrous sulfate or ferric or ferrous chloride causes transient irritation and inflammation, and prolonged contact may lead to brown discoloration of the conjunctiva (Grant 1986, p. 532).

The Agency preliminarily concludes that, in the absence of a limit, employees in construction, maritime, and agriculture are at risk of experiencing the skin and mucous membrane irritation associated with inhalation exposure to these soluble salts. OSHA considers these adverse health effects to be material impairments of health and believes that a 1 mg/m³ 8-hour TWA PEL for the soluble iron salts is necessary to substantially reduce these significant occupational risks. Promulgation of this limit will also make the PEL for these

substances consistent across all OSHA-

regulated sectors.

ISOAMYL ACETATE
CAS: 123–92-2; Chemical Formula:
CH₃COOCH₂CH(CH₃)C₂H₃
H.S. No. 2096

In general industry, construction, and maritime, OSHA's permissible exposure limit for isoamyl acetate is 100 ppm as an 8-hour TWA. There is no limit in agriculture. The ACGIH has a TLV*-TWA of 100 ppm for this substance; NIOSH has no REL. OSHA is proposing an 8-hour TWA PEL in agriculture of 100 ppm for isoamyl acetate. This is the limit recently established for this substance in general industry.

Isoamyl acetate is a colorless liquid with a banana-like odor. It is used widely as a solvent and flavoring agent and as an ingredient in fragrances, polishes, and photographic film. Isoamyl acetate also is used in the extraction of penicillin; as a warning odorant; and in the manufacture of artificial silk, leather, and glass (HSDB 1986; Parmeggiani 1983,

p. 783).

In both animals and humans, isoamyl acetate is an irritant of the eyes, mucous membranes, and respiratory tract; at high concentrations, it causes central nervous system depression. Systemic effects also have been shown to occur in laboratory animals exposed to isoamyl acetate. The oral LDso in rats is 16.6 g/ kg, and the lowest lethal concentration in cats is 35,000 mg/m3 for an unspecified period (RTECS 1990). A 248hour exposure to a 7200-ppm concentration of isoamyl acetate was fatal to cats; these animals showed signs of narcosis before death and died of pneumonia (Lehmann and Flury 1943, p. 228; Clayton and Clayton 1982, p. 2274). Changes in the liver, congestion and hypertrophy of the spleen, congestion of the kidney, and degenerative and reparative changes of the tubular epithelium were noted at autopsy in rabbits that had been subacutely poisoned by exposure to isoamyl acetate (Browning 1965, p. 540). In humans, a 30minute exposure to a 1000-ppm concentration of isoamyl acetate resulted in irritation, difficult breathing, increased pulse rate, and fatigue (ACGIH 1986, p. 329). Severe throat irritation was reported as a result of exposure to 200 ppm, and minor throat discomfort resulted from exposure to a 100-ppm concentration of isoamyl acetate (Amoore 1950, p. 53; Nelson 1943, p. 282). Exposure to a 300-ppm concentration caused noticeable eye irritation, and exposure to higher concentrations caused burning and redness of the eyes (Grant 1986, p. 97). Workers in a hat factory exposed to isoamyl acetate at unspecified concentrations reported experiencing

nervous system disturbances, including headache, drowsiness, palpitation, and excessive fatigue (Browning 1965, p. 541).

Based on this evidence in humans and animals, OSHA preliminarily concludes that, in the absence of a permissible exposure limit, workers in agriculture are at significant risk of experiencing the eye, mucous membrane, and upper respiratory tract irritation associated with exposure to isoamyl acetate and that they may also be at significant risk of experiencing central nervous system depression. The Agency believes that establishing an 8-hour TWA PEL of 100 ppm for this substance is necessary to substantially reduce this risk. In addition, promulgation of this limit will make OSHA's PEL for this substance consistent across all regulated sectors.

ISOPROPYL ACETATE
CAS: 108-21-4; Chemical Formula:
CH₃COOCH(CH₃)₂
H.S. No. 1224

OSHA has a 250 ppm 8-hour TWA limit for isopropyl acetate in the construction and maritime industries. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 250 ppm and a TLV®-STEL of 310 ppm for isopropyl acetate; there is no NIOSH REL for this substance. The Agency is retaining its 250 ppm 8-hour TWA in construction and maritime, proposing to add a 310 ppm STEL for isopropyl alcohol in these two sectors, and proposing to extend both limits to agriculture. These are the limits recently established for isopropyl acetate in general industry.

Isopropyl acetate is a colorless liquid with a fruity odor. It is used as a solvent for nitrocellulose lacquers and other resins, fats, oils, waxes, and gums. It is also used in perfumes and as a flavoring agent for foods (Sittig 1985, p. 531; ACGIH 1986, p. 336).

Isopropyl acetate causes irritation of the eyes and mucous membranes; at high concentrations, it causes central nervous system depression in both animals and humans (Clayton and Clayton 1981, p. 2268; Gosselin, Smith, and Hodge 1984, p. II-203). The oral LD50 in rats is 3000 mg/kg; five of six rats died after a four-hour exposure to a 32,000-ppm concentration of isopropyl acetate, and one of six rats died after a 4-hour exposure to a 16,000-ppm concentration (Smyth, Carpenter, Weil, and Pozzani 1954/Ex. 1-440; RTECS 1991). The corneal burns caused by isopropyl acetate generally heal within 3 to 10 days (Clayton and Clayton 1981, p. 2277). Oral administration of isopropyl acetate to rabbits (dose not specified)

caused loss of coordination (Clayton and Clayton 1981, pp. 2268–2269).

The primary problems associated with occupational exposure to isopropyl acetate are eye and mucous membrane irritation. In humans, exposure to a 200ppm concentration of isopropyl acetate for 15 minutes caused mild eye irritation; nose and throat irritation occurred on exposure to higher concentrations (Silverman, Schulte, and First 1946/Ex. 1-142). In two cases involving splashes of isopropyl acetate in the eye, healing was slow but complete (Grant 1986, p. 539). Workers chronically exposed to isopropyl acetate at unspecified concentrations have reported experiencing conjunctival irritation, cough, and a tight feeling in the chest; skin defatting and cracking have also been reported (Parmeggiani 1983, p. 72).

Based on this evidence, OSHA preliminarily concludes that exposure to isopropyl acetate causes irritant effects. The Agency considers these effects material impairments of health and preliminarily finds that the proposed limits are necessary to reduce these significant risks to workers in construction, maritime, and agriculture. Accordingly, OSHA is retaining the 250ppm 8-hour TWA limit in construction and maritime, proposing a 310-ppm STEL for this substance in these two sectors, and proposing both limits in agriculture. Promulgation of these limits will make OSHA's PELs for isopropyl acetate consistent across all regulated sectors.

ISOPROPYL ALCOHOL CAS: 67-63-0; Chemical Formula: CH₃CHOHCH₃ H.S. No. 1225

The current PEL for isopropyl alcohol in the construction and maritime industries is 400 ppm as an 8-hour TWA. OSHA has no limit for this substance in agriculture. The ACGIH has a TLV*-TWA of 400 ppm and a TLV®-STEL of 500 ppm for isopropyl alcohol. NIOSH has a REL for isopropyl alcohol of 400 ppm as a 108-hour TWA and 800 ppm as a 15-minute ceiling limit but concurs (Ex. 150) with the limits being proposed by OSHA. The Agency is proposing a 400ppm TWA and a 500-ppm STEL for isopropyl alcohol in the construction, agriculture, and maritime industries. OSHA recently established these PELs in general industry.

Isopropyl alcohol is a colorless, flammable liquid with the odor of rubbing alcohol. It is used as a starting material in the synthesis of acetone, glycerin, and other substances and is widely used throughout industry as a solvent, component of household

products, ingredient in cosmetics and medicinals, as rubbing alcohol, and as a flavoring adjuvant (HSDB 1986; ACGIH 1986, p. 337).

Isopropyl alcohol is an irritant of the eyes and mucous membranes; at high concentrations, it causes narcosis in both humans and animals. The oral LDsa in rats is 5045 mg/kg, and the dermal LD50 in rabbits is 12,800 mg/kg (RTECS 1991). The lowest lethal concentration in rats is 12,000 ppm for 8 hours. Acutely poisoned animals show central nervous system effects before death (RTECS 1991). Mice exposed for 460 minutes to a 3250-ppm concentration of isopropyl alcohol developed ataxia, prostration, and narcosis (Proctor, Hughes, and Fischman 1988, p. 291). Conjunctivitis, iritis, and corneal opacity developed when the eyes of rabbits were instilled with a 70-percent isopropyl alcohol solution (Clayton and Clayton 1981, p. 4563). Applied once to the skin of rabbits, isopropyl alcohol caused a mild degree of irritation (RTECS 1991); however, prolonged contact of isopropyl alcohol with the skin of rabbits produced slight redness, dryness, and superficial desquamation (Clayton and Clayton 1982, p. 4565). Rats given 0.5 to 10 percent isopropyl alcohol in their drinking water for 27 weeks failed to gain weight at the normal rate but showed no gross or microscopic abnormalities at autopsy (Clayton and Clayton 1982, p. 4565). Inhalation of a 394-ppm concentration of isopropyl alcohol for 24 hours caused damage to the nasal mucosa of guinea pigs, although recovery occurred within 2 weeks if exposure was terminated; however, exposure to a concentration of 4550 ppm for the same period caused damage that took longer to recover (Ohashi, Nakai, Koshimo, Esaki, Ikeoka, Hariguchi, Teramoto, and Nakaseko 1988; Env. Res. 46(1):25-38).

Isopropyl alcohol has caused irritation of the eyes, nose, and throat in humans exposed for brief periods to a concentration of 400 ppm; at 800 ppm, these symptoms were more intense (Nelson, Enge, Ross, et al. 1943/Ex. 1-66). In addition, isopropyl alcohol has narcotic effects at higher concentrations. Prolonged or repeated contact of the skin with this solvent causes drying and dermatitis (HSDB 1990). At least one case of dermal sensitivity to isopropyl alcohol has been confirmed by patch test (HSDB 1990). An excess of paranasal sinus cancers, and perhaps of larvngeal cancers, was observed among workers manufacturing isopropyl alcohol (Weil, Smith, and Nale 1952/Ex. 1-453). However, it has been established that the cancers associated with

isopropyl alcohol manufacture were caused by the strong-acid manufacturing process and not by the isopropyl alcohol itself (Proctor, Hughes, and Fischman 1988, pp. 291–292; IARC 1987, Suppl. 7, p.

Based on this evidence, OSHA preliminarily concludes that workers exposed to isopropyl alcohol are at significant risk of experiencing the narcotic and irritant effects associated with exposure to this substance. The Agency believes that the proposed limits, which were recently established for this substance in general industry, are necessary to substantially reduce these significant risks among workers in construction, maritime, and agriculture. OSHA considers the narcosis and eye and mucous membrane irritation associated with chronic and acute exposures to isopropyl alcohol material impairments of health within the meaning of the Act. n-ISOPROPYLAMINE

CAS: 75-31-0; Chemical Formula: (CH₅)₂CHNH₂ H.S. No. 1228

OSHA's limit for n-isopropylamine in the construction and maritime industries is 5 ppm as an 8-hour TWA. The Agency has no PEL for this substance in agriculture. The ACGIH has a TLV*-TWA of 5 ppm and a TLV*-STEL of 10 ppm for n-isopropylamine; there is no NIOSH REL. OSHA is proposing to retain its 8-hour TWA limit of 5 ppm in construction and maritime, proposing to add a STEL of 10 ppm in these sectors, and proposing to extend both limits to agriculture. The Agency recently established these PELs in general industry, and NIOSH (Ex. 8-47)

appropriate for n-isopropylamine.
n-Isopropylamine is a flammable,
volatile, colorless liquid that has an
odor similar to that of ammonia. This
substance is used as a chemical
intermediate in the synthesis of
insecticides, pharmaceuticals,
bactericides, dyes, rubber accelerators,
and textile specialties. It is also used as
a dehairing agent and solvent (HSDB
1986).

concurred that these limits were

n-Isopropylamine causes eye, skin, mucous membrane, and respiratory tract irritation; at high concentrations, exposure may cause pulmonary edema. The oral LD₅₀ in rats is 820 mg/kg, the LC₅₀ in the same species is 4000 ppm for 4 hours, and the dermal LD₅₀ in rabbits is 380 mg/kg (RTECS 1990). Applied to the skin of rabbits, isopropylamine caused severe irritation (RTECS 1990). Instilled into the eyes of rabbits, this substance caused injury rated 10 on an ascending severity scale of 1 to 10

(Grant 1986, p. 1041). The most serious effect of exposure to n-isopropylamine in laboratory animals is respiratory tract irritation, which can be severe enough to cause lung edema (Smyth 1956/Ex. 1–759)

Exposure to isopropylamine causes eye, nose, and upper respiratory tract irritation in humans. Volunteers exposed to isopropylamine concentrations of 10 to 20 ppm experienced nose and upper respiratory tract irritation after brief (not further specified) exposures (Clayton and Clayton 1981, pp. 3154-3155). Workers exposed for 8 hours to isopropylamine vapor at an unspecified concentration developed transient corneal edema. manifested as haloes around lights (Proctor, Hughes, and Fischman 1988, p. 292). Splashed into the eye, isopropylamine can cause burns and permanent visual impairment; skin contact may cause irritation, dermatitis, and burns (Proctor, Hughes, and Fischman 1988, p. 292).

Based on this evidence, the Agency preliminarily concludes that both a TWA and STEL are required to protect exposed workers in construction, maritime, and agriculture from the significant risk of eye, nose, and upper respiratory tract irritation that is known to be associated with exposure to isopropylamine. The Agency considers eye, nose, and upper respiratory tract irritation material impairments of health and preliminarily finds that adding a 10ppm 15-minute STEL to the limit for isopropylamine is necessary to substantially reduce the risk posed to workers by exposure to this substance. Promulgation of these limits will also make OSHA's PELs for isopropylamine consistent across all regulated sectors. ISOPROPYL ETHER

CAS: 108–20–3; Chemical Formula: (CH₃)₂CHOCH(CH₅)₂ H.S. No. 1228

OSHA's limit in construction and maritime for isopropyl ether is 500 ppm as an 8-hour TWA limit. There is no PEL in agriculture. The ACGIH has a TLV*-TWA of 250 ppm and a TLV*-STEL of 310 ppm for isopropyl ether. NIOSH has no REL but concurred (Ex. 8-47, Table N1) with the limit being proposed. OSHA is proposing an 8-hour TWA PEL of 500 ppm for workplaces in agriculture. This is the limit recently established for this substance in general industry.

Isopropyl ether is a liquid that smells like ether. It is widely used as a solvent in mineral, vegetable, and animal oils and in waxes, paints, varnish removers, and rubber cements (HSDB 1986).

Isopropyl ether is an irritant of the eyes, nose, and upper respiratory tract
